by replacing the tourniquet by the sphygmomanometer cuff and slowly deflating. Possibly the limb vessels were already in spasm, so that these measures would achieve little. Another expedient was to pack the limb in ice so as to reduce the blood flow through the limb and diminish the rate of tissue breakdown, dependent on the action of enzymes, which acted best at about body temperature. The next point was alkalization of the blood or urine, because these patients tended to have a low alkali reserve. Administration of alkalis in quantities sufficient to make the urine alkaline was rational. Sodium bicarbonate and citrate should be given by mouth in quantities of 200 to 300 grains (13 to 20 Gm.) daily. The use of the sodium salt was important, because the high concentration of potassium in the blood of these patients might be one of the fatal biochemical factors. Good diuresis, of course, could not be maintained in the presence of circulatory collapse, and shock should be treated by serum or plasma transfusion. In our present state of knowledge these suggestions were only tentative.

The Bread Controversy

The adoption of white bread seems to have been a blunder. Reform is far from easy and the way is blocked by public taste. In a letter to the *Times*, Lord Bledisloe, minister of food, says that an unfortunate development of democracy is that the taste of the proletariat, however noxious, becomes reflected in large scale industrial enterprise. No better illustration can be given than the craze for the white loaf because it is white, light and relatively durable, and the response to it by the modern steam roller mills eliminating from our bread the appetizing germ and the finer skins of the wheat grains with their minerals and vitamins.

The policy of the minister of food continues to be severely criticized in the *Times* and in the medical journals. Sir Wyndham Dunstan attacks his decision to fortify the white loaf with manufactured vitamin B₁ and calcium. The expense is \$6,250,000, which is to be spent on the manufacture of the vitamin and \$5,000,000 on distribution and incorporation in the daily bread supply. This reinforced bread is unnecessary, now that the standard wheatmeal loaf is available. Dr. Harris, Director of the Institute of Research for the Prevention of Disease, writes that calcium taken in excess affects the function of the kidneys and may easily prove a factor in hardening of the arteries. To put it at its lowest, the addition of calcium to bread would mean that forty million people would be used as experimental rabbits. That redoubtable controversialist Sir Ernest Gordon Graham-Little (dermatologist and member of Parliament) still maintains that the recommendations of the Medical Research Council for the new national loaf of 85 per cent extraction (against the usual 73) should not be carried out. Though there may be 85 per cent extraction, the flour is often still deprived of practically all the germ. Graham-Little says that "95 per cent of the flour controlled by the ministry is deprived of all its wheat germ and is chemically bleached, flouting the two principal recommendations of the Medical Research Council."

Nurseries for Children of War Workers

A large number of women are now engaged in war industries, and many of them are married and have young children. The London Women's Parliament has decided to send a deputation to the ministers of health and of education to emphasize the need for the provision of nurseries for war workers' children. Many mothers with recent factory experience are eager to return to work but have no one to take care of their young children. The solution is the rapid establishment of war time nurseries in large numbers and big extension of residential nurseries, preferably in reception areas.

Precautions Taken Against Typhus Fever

Typhus fever is ravaging a large part of Europe, including the eastern war front, Poland, the Baltic states, Germany, the Ukraine and Spain. It has also appeared in northern Africa. The British government has already taken precautions, which include arrangements for the supply of vaccine and the setting up of laboratories in the Middle East. On the home front the public health services have made preparations by which local authorities could carry out immediate large scale inoculation. At the ports, precautions have been taken to prevent the spread of the disease to this country.

The Treatment of Epilepsy with Phenytoin

Prof. Charles Baudouin, dean of the faculty of medicine in Paris, read a paper before the Academy of Medicine, March 4, 1941, on the treatment of epilepsy by means of phenytoin sodium. During a trip to the United States in November 1937 he visited the medical services of Drs. Tracy J. Putnam and H. Houston Merritt in Boston, where he became acquainted with the new antiepileptic medicament. Drs. Merritt and Putnam in the Sept. 17, 1938 issue of *THE JOURNAL* published an article entitled "Sodium Diphenyl Hydantoinate in the Treatment of Convulsive Disorders." The product, introduced as dilantin in the United States, is known in Europe as epanutin. Professor Baudouin's experimentation with this product in 1940 was resumed by means of a French firm's product, using phenytoin and its sodium, calcium and magnesium salts. Professor Baudouin prefers the use of phenytoin itself because, compared to its derivative sodium, it is insoluble in water and unalterable in air. By administering from 0.3 to 0.5 Gm. daily as a cachet or as a compressed tablet of 0.1 Gm. to 13 patients he has not observed any nervous sequels, vertigo or digestive troubles. An erythrodermia was observed, but it quickly vanished after discontinuance of the drug. Of 13 epileptic patients 12 were resistant to phenobarbital or bromide treatment. In 5 grand mal cases three good results and one failure were observed. Among the 6 patients having petit mal attacks one excellent result, one good one, two improvements and two failures were observed. Professor Baudouin proposes not to omit phenobarbital entirely while treating epilepsy with phenytoin. Good results have been generally obtained by the combination of 0.1 to 0.15 Gm. of phenobarbital with 0.3 Gm. of phenytoin. Phenytoin is less hypnotic than phenobarbital.

Depressive Cardiovascular Action Caused by Phenytoin

At a meeting of the Academy of Medicine on July 8, 1941 Professor Baudouin reported an experiment on dogs with intravenous injections of phenytoin and its sodium derivative. The action of phenytoin and phenytoin sodium proved to be identical. In doses of 0.005 Gm. per kilogram a slightly depressive cardiovascular action can be observed. This inhibitory action is more evident at the auricle than at the ventricle (electrocardiogram). The arterial pressure is lowered and slackening of the rhythm until momentary cessation of heart action can be observed. Up to a dose of 0.02 Gm. these actions are temporary and reversible. Injection successively of the total dose of 0.04 to 0.06 Gm. may cause death. To this vagomimetic action, which is probably of central origin, a directly depressive muscular effect is still added. After the vagus has been cut, phenytoin always proves to be inhibitory. No changes are seen when sparteine is administered. Certain calcium salts, however, which affect the muscles directly as cardiotonics fight efficiently against the depressive action of phenytoin. Intravenous injections of this medicament to human beings are not feasible.

BUENOS AIRES

Tuberculosis

Dr. Luis Sayé of Buenos Aires recently read a paper in which he discussed tuberculosis, which continues to be a main cause of mortality in all countries of the world except five or six. The epidemic cycle of the disease from acute to attenuated forms lasts from thirty to more than one hundred years. The curve of mortality follows three different patterns for the three different phases of (1) tubercularization, (2) relative stabilization of the disease with slow diminution of the curves of mortality and (3) rapid diminution of the curves. The highest rate of mortality corresponds to patients of about 30 years of age. There are malignant clinical forms with a tendency to generalization of the disease. This epidemiologic phase predominates in Portugal, Greece, the northern, central and southern regions of Africa, Asia, Oceania, Venezuela, Brazil, Ecuador, Peru, Chile, Colombia and Bolivia. In the phase of relative stabilization of the disease the rate of mortality from tuberculosis varies between 10 and 16 per 10,000 people. Switzerland, Finland, Belgium, France, Spain, Italy, Argentina, Uruguay, Mexico and Cuba had tuberculosis in this phase in 1937-1938. In the phase of rapid diminution of the disease the rate of mortality from tuberculosis varies from 4 to 10 per 10,000 people. The frequency of this type of tuberculosis in infants and school children is rare. Complete infection is exhibited in patients between the ages of 40 and 50. The curve of mortality in men and women is similar. The age of greatest mortality for either men or women is between 40 and 80 years. England, Sweden, Norway, Denmark, the Netherlands, Germany, the United States, New Zealand and Australia had tuberculosis in this phase in 1937 and 1938. The results of crusades against tuberculosis show how much can be expected from work on prevention of the disease when it is carried on properly and in proportion with the needs. The good results obtained in preventing tuberculosis in the United States by controlling the diseases in cattle are recognized.

In countries in which well coordinated crusades on public hygiene are carried on, as is the case in Venezuela, the intensification of work for prevention of tuberculosis will cause a rapid lowering of the endemic curves of the disease.

In the United States, the Netherlands, Denmark, New Zealand and Australia the incidence of tuberculosis has greatly diminished in the last ten years. One wonders whether the disease will disappear from those countries within the coming twenty years. The insufficient results of antituberculosis crusades are shown by the frequency of tuberculosis in women between the ages of 16 and 35. Roentgenograms have been systematically taken of several thousand persons who lived in the poor districts of New York and Chicago in the course of antituberculosis crusades. It is found that tuberculosis is frequent among adolescents, Negroes and industrial workers who live in poor districts of large cities. The results of this research indicates the advisability of complementing the antituberculosis crusades (1) with the administration of antituberculosis vaccines to noninfected persons, (2) by carrying on periodic roentgen examinations of the thorax of persons exposed to tuberculosis and, if possible, of the thoraces of persons of the entire city and (3) by controlling tuberculosis in birds, hogs and other animals.

REHABILITATION OF TUBERCULOUS PATIENTS

Drs. F. Etcheverry Boneo and L. L. Silva recently published an article in the *Revista de Kinesiología* on the importance of medical gymnastics in rehabilitating patients after clinical cure of pulmonary tuberculosis. The exercises begin after discontinuation of prolonged rest and progress as follows: The patient, sitting on a chair, performs mild movements of relaxa-

tion of the muscles of the neck, thorax and arms, with closed eyes. He moves first the fingers, then the hands, forearm, elbow, arm and head. He breathes according to the rhythm of certain sounds. The exercises are performed for five minutes every other day for one month. Then the exercises are repeated every other day but more energetically and for ten minutes. Creeping and other movements of the legs are also performed during the second and third series of exercises. The treatment is repeated once more. This time the patients stand while performing the exercises, which should be energetic and mild in alternation. The exercises should be modified for patients who have structural changes of the thorax from an operation. The duration of the second and third series of exercises depends on the variations of the pulse, the weight and clinical symptoms. The frequency of the pulse should not change, or it should diminish immediately after the exercises. The authors administered the treatment to 235 patients with apparent clinical cure. The treatment of 25 patients was discontinued early in its course with reappearance of clinical symptoms. In these cases the exercises were a test for apparent clinical cure and for continuation of treatment for their tuberculous lesions; 40 patients are still under treatment. The clinical cure obtained by the treatment in 170 cases continues up to now. The body weight increased in 157 cases in the group of patients with clinical cure and remained stationary in 13 cases.

Brief Items

A clinic and hospital with two well equipped departments for work on prevention and therapy of syphilis and leprosy was recently opened to the public in Paraguay. This center will be a branch of the National Department of Hygiene. Dr. Ricardo Ugarriza is the director.

Dr. José B. Gómez of Buenos Aires left Argentina recently for Chicago. He will have a scholarship for one year given to him by the Argentine National Cultural Committee. He will study the pathology of primary tuberculous infection and BCG vaccination under Drs. Henry Sweany and Rosenthal of Chicago.

Prof. José Arce presented his resignation from the chair of clinical surgery in the Faculty of Medical Sciences of Buenos Aires. Dr. Oscar Ivanissevich was appointed to succeed him.

Dr. Franz Keysser of Buenos Aires, previously of Germany, died Jan. 29, 1941. He was a well known worker on the field of electrosurgery, on which he wrote several important articles.

Marriages

ADAMSON GORGAS BRENZER JR., Charlotte, N. C., to Miss Meredith Ewing Marshall of Providence, R. I., January 1.

IRVING DAVID LONDON, West New York, N. J., to Miss Sarah Miller of Lineville, Ala., in Brooklyn, January 1.

JOHN WATKINS TRENIS, Washington, D. C., to Miss Nelle Frances Elliott at Birmingham, Ala., in January.

GEORGE M. COOPER to Miss Alison Suzanne Hughson, both of Buffalo, at Cochran Field, Ga., February 28.

SAMUEL WATSON PAGE JR., Greenwood, S. C., to Miss Edric Ary Martin at Hillsboro, N. C., January 17.

WADLEY RAOUL GLENN to Miss Mary Frances Lewis, both of Atlanta, Ga., in Pensacola, Fla., recently.

GEORGE RITCHIE WALL, Siler City, N. C., to Miss Claudia Harris at Chevy Chase, Md., January 23.

JAMES NISSENBAUM, Appleton, Wis., to Miss Jean Hoffman of Ironwood, Mich., January 4.

GATES J. WAXELBAUM to Miss Sarah Frances Thames, both of Atlanta, Ga., recently.

MAX NORMAN to Miss Agnes Zuverink, both of Chicago, in Joliet, Ill., recently.

RALPH V. PLATON to Miss Joanne Pierson, both of Minneapolis, January 23.

Deaths

Joseph Bolivar De Lee ♂ emeritus among obstetricians in the United States, died at his home in Chicago, April 2, of coronary thrombosis, aged 72. Dr. De Lee was born in Cold Springs, N. Y., Oct. 28, 1869. After preliminary education at the College of the City of New York, he received the degree of doctor of medicine from the Chicago Medical College, now Northwestern University Medical School, in 1891. Following an internship in the Cook County Hospital during 1891 and 1892 he became demonstrator in anatomy at his alma mater for one year, then lecturer in physiology in the dental school. He then studied in the universities of Vienna, Berlin and Paris, returning to Chicago in 1894 and becoming demonstrator in obstetrics and then a lecturer on obstetrics, assuming the chair of obstetrics in 1896 and the title of professor of obstetrics in 1897.

Almost immediately Dr. De Lee undertook the organization and building of a lying-in dispensary, which he founded in 1895. He began his obstetric work in a small maternity center in a building in the slums in an area in which all maternity care had been largely done by midwives. The hospital for maternity care was first opened in 1899. It began promptly to grow and to develop. In 1917 the first Chicago Lying-In Hospital and Dispensary was opened by Dr. De Lee in Chicago and in 1931 it became affiliated with the University of Chicago, and a new institution was built on the campus of the university. This institution was formally merged with the University in 1938. When the Chicago Lying-In Hospital became associated with the University of Chicago he became professor of obstetrics and gynecology and chairman of the department of obstetrics and gynecology in the University of Chicago in 1929, holding that position for three years and serving thereafter as consultant to the hospital. In 1938 the board of trustees of the University of Chicago named the main building of the Chicago Lying-In Hospital group the Joseph B. De Lee Hospital. It is reported that more than 28,000 children have been born in the present institution and that it operated without a single maternal death in a period extending over eighteen months.

From the very beginning of his career Dr. De Lee devoted himself largely to the education and advancement of his specialty in the practice of medicine. In 1932 he founded the Chicago Maternity Center and until the time of his death served as consulting obstetrician. He was the author of a notable work, "The Principles and Practice of Obstetrics," first published in 1913 and now in its seventh edition. He was the author of "Obstetrics for Nurses," which is now in its twelfth edition and which was first published in 1904. He also published "Notes on Obstetrics" in 1904 and in the same year assumed editorship of the Year Book of Obstetrics. These books and monographs on obstetrics have been translated into most of the languages in the world and are used in medical schools in many nations.

Dr. De Lee was intimately associated with innumerable organizations in his specialty, including honorary fellowship in the Edinburgh Obstetrical Society. He was a fellow and vice president (1929) of the American Gynecological Society, a fellow of the American College of Surgeons. He was secretary of the Illinois State Medical Society in 1899, president of the Chicago Gynecological Society in 1908 and a councilor of the Chicago Medical Society in 1902. During 1933-1934 he was chairman of the Section on Obstetrics, Gynecology and Abdomi-

nal Surgery of the American Medical Association. In 1906 he was awarded the master of arts degree from Northwestern University.

On his 65th birthday Dr. De Lee was awarded the Jesse L. Rosenberger Medal, which was first won by C. L. Banting, co-discoverer of insulin.

Dr. De Lee recognized early the importance of the motion picture as a means of education. The new lying-in hospital was especially equipped for the making of motion pictures, particularly for educational purposes. Dr. De Lee was also the inventor of special devices used in obstetric and gynecologic practice. Practically all the proceeds derived from his practice and his publications Dr. De Lee devoted to the upbuilding of institutions with which he was associated and to the advancement of the teaching of obstetrics. In his career Dr. De Lee devoted himself not only to the institution which now bears his name but for many years was attending obstetrics in the Cook

County, Wesley, Mercy and Provident hospitals. Throughout his life he campaigned for improvement in obstetrics as a science and for techniques which would lower the death rates of mothers and babies. He lived to see many of the procedures for which he fought recognized as essential routine in his specialty.

Arthur Vincent Goss, North Pownal, Vt.; University of Vermont College of Medicine, Burlington, 1886; member of the American Psychiatric Association; first assistant physician at the Brattleboro Retreat, Brattleboro, Vt., from Oct. 15, 1923 to June 30, 1932; formerly on the staff of the Butler Hospital, Providence, R. I.; at one time assistant physician, assistant superintendent and superintendent of the Taunton (Mass.) State Hospital; aged 82; died, January 24, in Timbridge of cerebral hemorrhage and hypertension.

John Abraham Pratt ♂ Minneapolis; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1894; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the Ontario College of Surgeons; formerly assistant professor of otology, rhinology and laryngology at the University of Minnesota

Medical School; for many years on the staff of the Minneapolis General and Asbury hospitals; aged 73; died, February 21, of pneumonia and carcinoma of the prostate.

Edward Sutphen Pope ♂ New York; New York Homeopathic Medical College and Hospital, New York, 1903; Jefferson Medical College of Philadelphia, 1905; formerly adjunct professor of otology at the New York Polyclinic Medical School and Hospital; executive surgeon and secretary of the Midtown Hospital; on the staff of St. Vincent's Hospital, Montclair, N. J., and the New York Eye and Ear Infirmary; aged 61; died, January 23, of coronary disease.

Robert Hugh Arthur, Toronto, Ont., Canada; McGill University Faculty of Medicine, Montreal, Que., 1885; Licentiate of the Kings Queens College of Physicians, Dublin, Ireland, 1885; served during World War 1; from 1914 to 1936 served on the Council of the Ontario College of Physicians and Surgeons and was president of that body in 1925 and 1926; past president of the Medical Council of Canada; at one time mayor of Sudbury; aged 80; died, Dec. 19, 1941.

Richard Joshua Brown ♂ Newark, N. J.; University and Bellevue Hospital Medical College, New York, 1910; member of the South Orange village board of trustees; consultant on the staff of the East Orange (N. J.) General Hospital, Babies' Hospital, Newark and the Essex County Hospital for Contagious Diseases, Belleville; secretary and obstetrician on the staff of the Presbyterian Hospital, where he died, February 4, of lobar pneumonia, aged 58.

JOSEPH BOLIVAR DE LEE, M.D., 1869-1942

George Joshua Gillam, Toronto, Ont., Canada; University of Toronto Faculty of Medicine, 1910; F.R.C.S. of England, 1923; served during World War I; a member of the staff in the department of anatomy as a demonstrator from 1923 to 1925 and a junior demonstrator in surgery from 1930 until 1933 at the University of Toronto Faculty of Medicine; aged 54; on the staff of the Toronto Western Hospital, where he died, Dec. 20, 1941.

Julius Wolff * New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1893; an Affiliate Fellow of the American Medical Association; ophthalmologist, Randall's Island Hospital, from 1899 to 1905; assistant ophthalmic surgeon to Bellevue Hospital from 1927 to 1932; served in various capacities on the staff of the Mount Sinai Hospital; aged 72; died, January 26, of acute coronary thrombosis.

Alexander Barclay Sr. * Coeur d'Alene, Idaho; University of Minnesota College of Medicine and Surgery, Minneapolis, 1907; past president of the Idaho State Medical Association; for many years member of the state medical examining board; fellow of the American College of Surgeons; medical director of the Coeur d'Alene Hospital; aged 59; died, February 27, at Arlington, Calif., of cirrhosis of the liver.

Charles Herman De Lancey * Passed Assistant Surgeon, Lieutenant, U. S. Navy, retired, Brooklyn; College of Physicians and Surgeons, medical department of Columbia College, New York, 1891; entered the navy June 23, 1900 and retired March 3, 1909 for incapacity resulting from an incident of service; aged 75; died, February 10, in the United States Naval Hospital of sarcoma of the left rib and lung.

Thomas Mitchell Burns * Denver; Gross Medical College, Denver, 1893; professor of obstetrics emeritus at the University of Colorado School of Medicine; fellow of the American College of Surgeons; attending obstetrician, Mercy Hospital; consulting obstetrician, Denver General Hospital, Florence Crittenton Home, and the National Jewish Hospital; aged 74; died, February 17, of posterior mediastinitis.

Samuel R. Holroyd, Athens, W. Va.; College of Physicians and Surgeons, Baltimore, 1890; member and past president of the West Virginia State Medical Association; county health officer; formerly member of the state legislature; at one time superintendent of the Spencer (W. Va.) State Hospital; aged 73; died in January in the Mercer Memorial Hospital, Princeton, of diabetes mellitus.

Thomas Van Hunter * Los Angeles; McGill University Faculty of Medicine, Montreal, Que., Canada, 1906; served with the Canadian Army during World War I; formerly on the staff of the Grace Hospital, Detroit, and the Highland Park (Mich.) Hospital; on the staff of the Presbyterian Hospital-Olmstead Memorial; aged 65; died, January 22, in an automobile accident.

Rollin Oliver Baker * Montour Falls, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1906; served during World War I; at various times health officer, school physician and county coroner; on the staff of the Shepard Relief Hospital; aged 59; died, February 11, in the Strong Memorial Hospital, Rochester, of carcinoma of the stomach.

Charles Green Rockwood Jennings, Elmira, N. Y.; University of Vermont College of Medicine, Burlington, 1884; College of Physicians and Surgeons, medical department of Columbia College, New York, 1885; formerly member of the board of education; aged 82; died, February 15, in the Arnot-Ogden Memorial Hospital of a fractured hip received in a fall.

William Austin Buchanan, Hammond, Ind.; University of Nashville (Tenn.) Medical Department, 1899; member of the Indiana State Medical Association; for many years secretary of the board of health of Hammond and formerly health officer; aged 71; on the staff of St. Margaret Hospital, where he died, February 11, of pyemia and diabetes mellitus.

Louis Francis O'Neill, Auburn, N. Y.; Albany Medical College, 1900; member of the Medical Society of the State of New York; past president of the Cayuga County Medical Society; formerly county coroner; on the staffs of the Mercy Hospital and the Auburn City Hospital; aged 66; died, January 5, of coronary occlusion and arteriosclerosis.

Irving Goumott Cameron * Brooklyn; Long Island College Hospital, Brooklyn, 1904; fellow of the American College of Surgeons; surgeon, Brooklyn Eye and Ear Hospital; consulting ear, nose and throat surgeon, Kings County Hospital; consultant in otorhinolaryngology, Wyckoff Heights Hospital; aged 66; died, February 1, of heart disease.

Charles Austin Durkee, Abercrombie, N. D.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; member of the North Dakota State Medical Association; county health officer; aged 62; died, February 19, in a hospital at Fargo of acute coronary occlusion and diabetes mellitus.

Alphonse R. Bizot, Louisville, Ky.; University of Louisville Medical Department, 1901; member of the Kentucky State Medical Association; member of the county selective service examining board; on the staffs of the St. Mary and Elizabeth Hospital and St. Joseph Infirmary; aged 67; died, February 13, of carcinoma of the pancreas.

James Bebout Bert, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1912; associate professor of obstetrics at his alma mater; served during World War I; aged 52; on the staff of St. Luke's and Children's Hospital and the Hahnemann Hospital, where he died, February 4, of pneumonia.

Charles Lorton Best * Freeport, Ill.; Rush Medical College, Chicago, 1904; fellow of the American College of Surgeons; past president of the Stephenson County Medical Society; on the staffs of the Deaconess Hospital and St. Francis Hospital; aged 62; died, February 6, of coronary occlusion.

Eric Olonzo Giere * Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1892; fellow of the American College of Surgeons; member of the state medical board from 1903 to 1906; surgeon, Fairview Hospital, where he died, February 12, of coronary thrombosis, aged 73.

Joseph Herbert Clyman * Philadelphia; Medico-Chirurgical College of Philadelphia, 1910; chairman of the local draft board; on the staffs of St. Luke's and Children's Hospital, St. Joseph Hospital and the Mount Sinai Hospital; aged 55; died, February 18, of coronary thrombosis.

Albertus Nyland, Grand Rapids, Mich.; Physio-Medical College of Indiana, Indianapolis, 1886; member of the Michigan State Medical Society; past president of the state board of registration in medicine; aged 86; died, January 29, in St. Mary's Hospital of cerebral hemorrhage.

Amos McKinnie Jones * Anson, Texas; University of Texas School of Medicine, Galveston, 1906; served during World War I; aged 62; on the staff of St. Ann Hospital and of the Hendricks Memorial Hospital, Abilene, where he died, January 7, of coronary thrombosis.

John Joseph Breen, Lowell, Mass.; St. Louis University School of Medicine, 1928; member of the Massachusetts Medical Society; examining physician for the local draft board; aged 39; on the staff of St. John's Hospital, where he died, February 3, of a ruptured peptic ulcer.

Howard W. Arndt, Lore City, Ohio; Starling Medical College, Columbus, 1897; member of the Ohio State Medical Association; aged 69; past president of the Guernsey County Medical Society; died, February 6, in St. Francis Hospital, Cambridge, of acute endocarditis.

Carl Freeman Pierce * Greensburg, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1907; past president of the Westmoreland County Medical Society; president of the staff of the Westmoreland Hospital; aged 60; died, January 22, of bronchogenic carcinoma.

Zannie Brantley * Grandin, Fla.; Atlanta (Ga.) School of Medicine, 1913; past president of the Putnam County Medical Society; for many years member of the board of county commissioners; aged 63; died, February 6, in a hospital at Palatka of pneumonia.

Stanley Frederick Goldman, New York; University and Bellevue Hospital Medical College, New York, 1936; member of the Medical Society of the State of New York; on the staff of the Bronx Hospital; aged 33; died, February 24, of cerebral hemorrhage.

James Randall Cooper, Richmond, Ind.; University of Nebraska College of Medicine, Omaha, 1932; member of the Indiana State Medical Association; superintendent of the Smith-Esteb Memorial Hospital; aged 38; died, February 7, of pneumonia.

Thomas Jefferson Stough, Montgomery, Ala.; University of Tennessee Medical Department, Nashville, 1893; member of the Medical Association of the State of Alabama; formerly member of the state legislature; aged 74; died, January 30, of nephritis.

Jefferson Brockner Van Tine, New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1893; formerly on the staff of the Sloane Maternity Hospital; aged 70; died, January 22, of carcinoma of the liver.

James Byron Van Horn, Tucson, Ariz.; Eclectic Medical Institute, Cincinnati, 1905; member of the Arizona State Medical Association; formerly a first lieutenant in the medical reserve, U. S. Army; aged 59; died, January 28, of cerebral thrombosis.

Clinton Amos Hardesty Ⓢ Paragould, Ark.; St. Louis College of Physicians and Surgeons, 1910; past president of the Greene County Medical Society; on the staff of the Dickson Memorial Hospital; aged 65; died, January 10, of coronary occlusion.

Ralph Livingston Daniels, New Bern, N. C.; Medical College of Virginia, Richmond, 1912; member of the American Academy of Ophthalmology and Otolaryngology; served during World War I; aged 54; died, February 21, of cerebral hemorrhage.

Harry Cattell Fisler Ⓢ Easton, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1895; on the staff of the Easton Hospital; aged 68; died, February 20, in the Jefferson Hospital, Philadelphia, of acute coronary thrombosis.

Justus Corbly Garard Ⓢ Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; aged 68; on the staff of St. Anne's Hospital, where he died, February 4, of carcinoma of the sigmoid.

Ellsworth E. Conover Ⓢ High Bridge, N. J.; University of Vermont College of Medicine, Burlington, 1885; on the staff of the Hackensack (N. J.) Hospital; aged 80; died, February 14, of shock and exhaustion following a prostatectomy.

Nathaniel Guido Clark Ⓢ Montgomery, Ala.; Birmingham Medical College, 1898; chief medical advisory officer of the department of correction and institutions of the state of Alabama; aged 69; died, February 11, of coronary occlusion.

George Richtmyer DeSilva, Catskill, N. Y.; University of the City of New York Medical Department, 1881; member of the Medical Society of the State of New York; aged 86; died, February 18, of acute dilatation of the heart.

Lemuel Baxley Russell, Hoopeston, Ill.; Rush Medical College, Chicago, 1894; past president of the Vermilion County Medical Society; member of the draft board during World War I; aged 73; died, January 22, of myocarditis.

Robert W. Cupp, Marmaduke, Ark.; Kansas City (Mo.) College of Medicine and Surgery, 1919; member of the Arkansas Medical Society; past president of the school board; aged 58; died, January 17, of carcinoma of the liver.

Gustavus G. Bock, Smithton, Ill.; St. Louis Medical College, 1882; member of the Illinois State Medical Society; for many years mayor of Smithton; aged 83; died, February 6, in Maryland Heights, Mo., of arteriosclerosis.

Oscar T. Bloomer, St. Joseph, Mo.; Central Medical College of St. Joseph, Mo., 1895; member of the Missouri State Medical Association; aged 80; died, February 19, of arteriosclerosis and cerebral hemorrhage.

Irwin Isadore Abrams, Toledo, Ohio; Detroit College of Medicine and Surgery, 1934; resident physician at the Veterans Administration Facility, Sunnyside, N. Y.; aged 33; died, February 5, in Lake Placid, N. Y.

Frederick George Ulman, Enumclaw, Wash.; University of Oregon Medical School, Portland, 1905; member of the Washington State Medical Association; aged 71; died, January 29, of coronary occlusion.

Byron E. Burnell Ⓢ Flint, Mich.; Detroit College of Medicine, 1901; past president of the Genesee County Medical Society; aged 75; died, February 16, in the Hurley Hospital of coronal vascular disease.

Charles Ross Bonzo, Ambridge, Pa.; Ohio Medical University, Columbus, 1903; member of the board of health of Ambridge; aged 61; died, February 8, of coronary thrombosis and diabetes mellitus.

Arthur O. Flowers, Clarksburg, W. Va.; College of Physicians and Surgeons, Baltimore, 1891; member of the West Virginia State Medical Association; aged 78; died, February 5, of acute peritonitis.

George Thomas Swail, Houston, Texas; M.B., University of Glasgow Medical Faculty, Scotland, in 1878 and M.D. in 1885; aged 93; died, January 11, in St. Joseph's Hospital of coronary occlusion.

Ira B. Oldham Ⓢ Muskogee, Okla.; Hospital College of Medicine, Louisville, Ky., 1892; aged 70; on the staff of the Oklahoma Baptist Hospital, where he died, January 14, of coronary occlusion.

John B. Argadine, Toledo, Ohio; Cincinnati College of Medicine and Surgery, 1893; aged 74; died, February 22, in St. Vincent's Hospital of uremia and a fracture of a femur received in a fall.

Nellie Veronica Donovan, New York; Cleveland Homeopathic Medical College, 1910; aged 54; died, February 8, in the Kings Park (N. Y.) State Hospital of arteriosclerotic heart disease.

Alice Idella Ross, Whittier, Iowa; State University of Iowa College of Homeopathic Medicine, Iowa City, 1894; aged 71; died, January 15, of carcinoma of the mammary gland.

Francis Adelbert Bragg, Foxboro, Mass.; Harvard Medical School, Boston, 1894; member of the Massachusetts Medical Society; aged 76; died, February 6, of cerebral hemorrhage.

Ernest H. Harris, Coy, Ark.; College of Physicians and Surgeons, Little Rock, 1911; member of the Arkansas Medical Society; aged 61; died, January 15, of coronary occlusion.

Charles M. Iddings, Brookeville, Md.; University of Maryland School of Medicine, Baltimore, 1888; aged 81; died in February of cerebral hemorrhage and arteriosclerosis.

Mary E. Troyer Williamson, Ramona, Okla.; Bennett College of Eclectic Medicine and Surgery, Chicago, 1883; aged 88; died, January 15, of injuries received in a fall.

John H. Ellington, San Augustine, Texas (licensed in Texas under the Act of 1907); member of the State Medical Association of Texas; aged 63; died, February 2.

Harvey Llewellyn Clarke Sr., Fairbury, Neb.; University of Michigan Homeopathic Medical School, Ann Arbor, 1882; aged 83; died, February 3, of coronary thrombosis.

Rembert Ernest Broadway, Summerton, S. C.; Medical College of the State of South Carolina, Charleston, 1911; aged 57; died, February 18, of coronary thrombosis.

General Grant Bragg, Huntsville, Mo.; Missouri Medical College, St. Louis, 1889; served during World War I; aged 75; died, February 9, of uremia and chronic nephritis.

William F. Williamson, Richmond, Va.; University College of Medicine, Richmond, 1905; served during World War I; aged 62; died, January 13, of heart disease.

Walter Brown, Hamilton, Ohio; Medical College of Ohio, Cincinnati, 1875; aged 91; died, February 13, in the Fort Hamilton Hospital of cerebral hemorrhage.

John Floyd A. Ketcham, Great Barrington, Mass.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1935; aged 39; died, January 30, of heart disease.

John S. Patterson, Staunton, Ill.; St. Louis College of Physicians and Surgeons, 1904; aged 75; died, January 13, in a hospital at Alton of arteriosclerosis.

William P. Collins, Racine, Wis.; Rush Medical College, Chicago, 1888; aged 82; died, February 7, in Lakeland, Fla., of bronchopneumonia and heart disease.

Martin David Goldenberg, Milwaukee; Marquette University School of Medicine, Milwaukee, 1929; aged 44; died, February 19, of coronary occlusion.

John T. Blanks, Dermott, Ark.; Medical Department of Tulane University of Louisiana, New Orleans, 1888; aged 80; died, February 18, of endocarditis.

Conrad Fisher Sayre, Charleston, W. Va.; College of Physicians and Surgeons, Baltimore, 1910; county coroner; aged 52; died, January 11.

Owen John Cameron, Antigonish, N. S., Canada; Harvard Medical School, Boston, 1918; aged 46; died, January 9.

DIED IN MILITARY SERVICE

Gustavus De Lana Funk Ⓢ El Reno, Okla.; University of Oklahoma School of Medicine, Oklahoma City, 1933; was called to active duty as a first lieutenant in the medical reserve, U. S. Army, Oct. 11, 1940, and was promoted to captain in December 1941; was assigned to the district recruiting office at Lubbock, Texas; aged 36; died, February 26, of heart disease.

Correspondence

PERIPHERAL VASCULAR DISEASE CLINICS

To the Editor:—The committee appointed by the American Heart Association to establish standards for peripheral vascular disease clinics desires to have a complete list of such clinics throughout the United States. Kindly communicate as soon as possible after seeing this notice with the chairman of this committee, giving the following data:

1. Name of hospital?
2. Name of chief or chiefs of clinic?
3. Under medical or surgical service?
4. Is there an associated hospital service?

A. WILBUR DURYEE, M.D., Chairman.
140 East Fifty-Fourth Street,
New York City.

PROPYLENE GLYCOL A MENSTRUUM FOR SODIUM SULFATHIAZOLE

To the Editor:—In Queries and Notes in a recent issue of THE JOURNAL (February 14, p. 567) one reads the reply to the disturbing question concerning the safe concentration of sodium sulfathiazole when used in medicating the nasal mucosa. As was so well stated, sodium sulfathiazole is not free of undesirable reactions because of the irritating properties associated with its alkalinity. Aqueous solutions of sodium sulfathiazole vary in pH from 10 to 11 and may become yellow on standing, especially when unprotected from daylight. To obviate the strong alkalinity, irritating properties and deterioration of such solutions, we have dissolved various sulfonamides in propylene glycol (*Modern Hospital* 57:106 [July] 1941; *J. Indiana M. A.*, to be published in April). The most useful of these propylene glycol preparations have been a 3 per cent solution of sulfathiazole, a 3 per cent solution of sulfapyridine and a 10 per cent solution of sulfanilamide. The pH of the sulfathiazole solution varies between 6 and 7 when diluted 1:9 with water, and the solution of sulfanilamide possesses a pH of 5.3 when diluted 1:7 with water, thus affording solutions whose pH more nearly conforms to normal nasal secretions. These secretions were found (Fabricant, N. D.: Significance of the pH of Nasal Secretions, *Tr. Am. Acad. Ophthalm.*, May-June, 1941, p. 197) to be acid in reaction, pH values varying from 5.5 to 6.5, and to become alkaline when infected. The 3 per cent solution of sulfathiazole can be diluted with 0.9 per cent saline solution or water prior to use, but the undiluted 3 per cent solution atomizes very well at 22 C. or more, is nonirritating to the mucosa of the nasal passages, oral pharynx, larynx, trachea or bronchi and affords definite relief in many cases of acute and chronic infections of the upper respiratory tract. Any type of organism susceptible to sulfonamide therapy should, if harbored in the upper respiratory tract, likewise be favorably affected by sulfonamides in propylene glycol. Detailed reports of various types of cases studied with Drs. G. B. Myers, R. H. Huff, J. M. Robb and R. W. Blackford at the Detroit Receiving Hospital will be published later, but results to date indicate that this preparation of sulfathiazole warrants extensive trial in infections of the upper respiratory tract. The patient is instructed to inhale while the solution is sprayed several times into the nose or throat at thirty or sixty minute intervals for four or five hours or more, and this procedure may be supported in cases of severe infections by proper oral doses of sulfathiazole.

If stored in amber colored bottles at 22 C. or more these self-sterilizing, nonirritating solutions of concentrated sulfathiazole remain stable, colorless and potent. Some of our solutions are now more than 6 months old and no apparent alteration in their consistency, appearance or potency is evident. Our

toxicity experiments on rabbits receiving these solutions intraperitoneally and intravenously and the investigations of the Stanford group (Hanzlik, D. J.; Neuman, H. W.; Van Winkle, W.; Lehman, A. J., and Kennedy, N. K.: Toxicity, Fate and Excretion of Propylene Glycol and Some Other Glycols, *J. Pharmacol. & Exper. Therap.* 67:101 [Sept.] 1939) reveal that, in contradistinction to diethylene glycol (Geiling, E. K.; Coon, J. M., and Schoeffel, E. W.: Preliminary Report of Toxicity Studies [of Diethylene Glycol] on Rats, Rabbits and Dogs, *THE JOURNAL*, Nov. 6, 1937, p. 1532; Haag, H. B., and Ambrose, A. M.: Studies on the Physiologic Effect of Diethylene Glycol, *J. Pharmacol. & Exper. Therap.* 59:93 [Jan.] 1937), propylene glycol can be well tolerated in large amounts without unfavorable results. The relative safety of propylene glycol is also assured by its use as a vehicle for certain proprietary vitamin D preparations and in sobisminol mass, and experience to date warrants its application in any concentration to any open lesion of the skin or mucosa, with the probable exception of the conjunctiva. This glycol, as well as ethylene glycol and trimethylene glycol, is an effective aerial germicide (Robertson, O. H.; Bigg, Edward; Miller, B. F., and Baker, Zelma: Sterilization of Air by Certain Glycols Employed as Aerosols, *Science* 93:213 [Feb. 28] 1941). Propylene glycol may be fortified, however, by addition of 10 per cent sulfanilamide, 3 per cent sulfathiazole or sulfapyridine. Unfortunately, sulfadiazine is only approximately 0.3 per cent soluble in propylene glycol. We also find that equal volumes of the three propylene glycol solutions of sulfanilamide, sulfathiazole and sulfapyridine may be mixed, since they are compatible and thus afford greater probability of efficiency in the presence of mixed infections.

ESTROGENIC TREATMENT OF GONORRHEAL VULVOVAGINITIS

To the Editor:—A few years ago I corresponded with reference to the relative worth of the estrogenic treatment of gonorrheal vulvovaginitis. In view of the fact that the originator of the estrogenic treatment, Dr. R. M. Lewis, has himself repudiated this treatment and in view of current literature corroborating his present attitude, I feel that it is worth while to bring this matter to your attention again. I quote from an article by him in *Venerical Disease Information* (22:352 [Oct.] 1941): "Unfortunately, treatment with estrogens is still employed. As I shall mention later, it has no curative value and is not to be compared with the brilliant results now obtainable with sulfathiazole. . . . It is evident that the estrogenic treatment was but a palliative procedure which carried patients along until spontaneous recovery occurred."

However, there are many interesting and valuable facts that have been brought out by this treatment. One is the fact that newborn females do not easily acquire gonorrheal vulvovaginitis, the probable reason being that they carry, for a short time, estrogens from their mothers (cause of hyperplasia of breasts and genitalia of newborn females). These estrogens apparently do not allow the gonococcus to gain a foothold in the newborn female genitalia. Nevertheless, in 1934 I reported 3 cases which occurred in premature females and recommended "that all newborn females have prophylaxis of the vulva routinely, along with the eyes." Since then this has become the routine practice in one of the largest hospitals of this city. Lewis now recommends "flushing the vagina and vulva of the newborn of infected mothers with silver solutions."

Bureau of Legal Medicine and Legislation**MEDICOLEGAL ABSTRACTS**

Malpractice: Liability for Results of Treatment of Infantile Paralysis.—In November 1934 the plaintiff wife lost the use of the upper part of her body, her arms and her hands as the result of an attack of infantile paralysis and was immediately placed under the supervision and direction of an orthopedic surgeon. While under his care she improved to a point at which she could rotate her arms and could perform simple tasks with her hands, such as cutting out pictures, untying knots in shoelaces, cleaning out grapefruit and peeling potatoes. There was very little improvement in the patient's ability to use the muscles of her upper arms and shoulders. Some time in July 1936 the patient became dissatisfied with her treatment and progress and consulted the defendant physician, an orthopedic surgeon with many years' experience in the treatment of patients afflicted with infantile paralysis. He agreed to treat her on the condition that she follow his instructions. On July 7, 1936 the defendant placed the patient in a cast which covered her body from her neck to her hips and extended down her arms to the first joint of the fingers and thumbs. The cast remained in place until November 11, when it was removed on the patient's complaint that it was becoming painful. When the cast was removed, the patient's wrists and fingers were found to be practically rigid, and many massage treatments and even manipulations under an anesthetic were necessary before any flexibility returned. There seemed to be a slight improvement in the shoulder muscles, however. In a subsequent suit by the patient and her husband against the defendant for damages, the trial court entered judgment for the plaintiffs, and the defendant appealed to the Supreme Court of Washington.

The only expert medical testimony in the case was supplied by the defendant and Dr LeCocq, a witness called in his behalf. Dr LeCocq stated that it was the approved and accepted practice of orthopedic physicians in that community to place an infantile paralysis patient in a cast in order to rest the affected muscles and that very often the physician would not visit the patient from the time the cast was put on until it was removed, the patient being advised to report if anything seemed wrong. Both Dr LeCocq and the defendant stated that some stiffness in the immobilized joints was to be expected, that such stiffness would occur within three to eight weeks after the cast was put on, and that it would not be aggravated or increased by permitting the cast to remain in place longer than eight weeks, because once the stiffness had set in it became fixed and would not change. The defendant further testified that when the cast was applied he told the patient to notify him any time anything seemed wrong. After about eight weeks he called the patient's husband and told him to buy a brace to be applied as soon as the cast was removed. Because of some financial trouble with the brace maker, however, the husband did not obtain the brace until November 10 or 11. The cast was then removed and the brace applied. There was also some evidence on behalf of the defendant that the patient did not follow all of the recommended treatment. The plaintiffs did not offer any expert testimony indicating that the patient's condition was in any way the result of the defendant's treatment.

The plaintiffs contended that the defendant's negligence consisted in leaving the patient in the cast for more than the customary six to eight weeks without making periodic investigations to ascertain her condition. They also contended that no expert testimony was needed to prove the defendant's unskilled and negligent treatment. The Supreme Court admitted that in malpractice cases it is not always necessary to prove negligence by direct and positive evidence but said that the only exceptions were cases in which the negligent act was readily apparent as the leaving of a sponge in a person's body after an operation. The most the plaintiffs' evidence showed, said the court, was that, when the cast was put on, the patient could use her wrists and fingers and when it was taken off she could not, in other words, that a bad result followed the attempt of the defendant to restore the use of the patient's shoulder muscles. A physician

is not a guarantor, and the mere fact that a bad result follows a particular treatment does not in itself establish negligence. Furthermore, the court was of the opinion that if the patient's husband had furnished the requested brace sooner the cast would have been removed sooner.

On the basis of all the evidence, the court thought, there was no competent showing that the patient's injuries in any way resulted from the fact that the cast was left on longer than the ordinary six to eight weeks or that if the defendant had made an investigation at the end of six or eight weeks he would have found a different condition from that which existed at the time the cast was ultimately removed. The court also held that the question of the defendant's negligence in this case could properly be determined only by medical experts and that, since the plaintiffs furnished none, to allow the judgment to stand would be to say that the jury could speculate on the question of the defendant's negligence. The judgment for the plaintiffs was accordingly reversed.—*Crouch v. Wyckoff*, 107 P. (2d) 339 (Wash., 1940).

Assault and Battery: Sufficiency of Evidence to Show Consent to Operation.—The plaintiff sustained injuries to his right chest and neck, above and below the clavicle, and was eventually taken to a hospital and placed under the care of the defendant physician. A roentgenogram disclosed a fracture of the transverse process of the sixth cervical vertebra on the right side. Electrical treatments were administered for a considerable period but without success; the plaintiff continued to suffer excessive pain in his shoulder whenever he moved his arm. The defendant therefore decided that an operation was necessary. Neither the exact nature of the operation nor its result was disclosed in the report of this case, but some time thereafter the plaintiff sued the defendant physician for damages. The jury disagreed, the defendant's motion for judgment was denied, and the defendant appealed to the Supreme Court of Pennsylvania.

The plaintiff contended that the defendant had performed the operation without his consent and was therefore guilty of an assault and battery. The evidence showed that after electrical treatment gave no relief the defendant advised the plaintiff that an operation would be necessary. Various conversations were held between the plaintiff and the defendant concerning this operation, and at no time did the plaintiff interpose any objection to it. In fact the plaintiff testified "Dr. Berg come to my room and tell me, he say, 'Mr. Dicenzo, we going to operate you half past eight tomorrow morning.' I say, 'O. K., doctor. Where are you going to operate me?'" Apparently the plaintiff's only worry was as to the location of the incision. He was aware, however, that surgical relief was necessary and that the region of the neck would be involved. The evidence showed that the incision was, in fact, "made over the neck." The Supreme Court observed that when a patient is in full possession of his faculties and able to consult about his condition and when no emergency exists making a conference with the physician impracticable, the patient's consent is a prerequisite to a surgical operation by his physician. An operation without the consent of the patient under such circumstances constitutes a technical assault. Applying that rule to the facts of this case, however, the Supreme Court was of the opinion that the defendant was fully justified in believing that the plaintiff had assented to the performance of the operation. The order overruling the defendant's motion for judgment was therefore reversed and judgment was entered for the defendant.—*Dicenzo v. Berg*, 16 A. (2d) 15 (Pa., 1940).

Malpractice: Pregnancy Diagnosed as Tumor; Right of Specialist to Rely on Diagnosis by Family Physician.

—The plaintiff, believing that she was pregnant, consulted her family physician, who examined her both externally and internally and diagnosed her condition as a tumor rather than a pregnancy. He then took the plaintiff to a roentgenologist for treatment. The only examination which the roentgenologist made was to feel the plaintiff's abdomen and call attention to its enlargement. Relying thus on the diagnosis of the family physician, he administered a roentgen treatment. The decision abstracted does not indicate what injury the patient suffered, but she sued the two physicians and the case in the trial court

was nonsuited as to the roentgenologist and dismissed for lack of jurisdiction as to the family physician because he resided in another county. The plaintiff appealed to the court of appeals of Georgia, division No. 1.

The plaintiff contended that the malpractice of the defendants consisted in their failure and refusal to make a roentgen examination to determine whether or not she was in fact pregnant. The court of appeals said that a patient was entitled to receive as thorough and careful an examination as the circumstances would permit. The evidence failed to show, however, said the court, that the family physician had an x-ray apparatus available at the time he made the diagnosis, that the method of examination used by him was not the customary one under the circumstances or that the child was fully enough developed to have been discovered by a roentgen examination. The plaintiff then insisted that the roentgenologist, who did have x-ray equipment available, should have made such an examination. The court of appeals held, however, that a specialist to whom a family physician refers a patient for treatment has a right to rely on the diagnosis made by the family physician unless there are contrary indications. The slight examination made by the roentgenologist in this case, continued the court, was sufficient to lead him to believe that the diagnosis of the family physician had been correct. He was therefore not required to examine further. In conclusion, the court also pointed out, this was a case which concerned highly specialized expert knowledge with which laymen were unfamiliar and that, "where want of skill and care is not thus shown by expert evidence applied to the facts, there is no evidence of it proper to be submitted to the jury. . . . Laymen, even jurors and courts, are not permitted to say what is the proper method of diagnosing a case for discovering the nature of an ailment." A court and jury must have a standard measure, which they can use in measuring the acts of a physician to determine whether or not he exercised a reasonable degree of care and skill. That standard has to be furnished by testimony of physicians, for it is a medical question. The plaintiff's evidence was entirely silent as to the standard method of diagnosing and treating a case of this nature. Therefore the action of the trial court nonsuiting one defendant and dismissing the other was proper and the judgment for the defendants was affirmed.—*Pilgrim v. Landham et al.*, 11 S. E. (2d) 420 (Ga., 1940).

Birth Control: Materiality of Intent of Vendor of Contraceptives.—A Massachusetts law provides that "whoever sells, lends, gives away, exhibits, or offers to sell, lend or give away an instrument or other article intended to be used for self-abuse, or any drug, medicine, instrument or article whatever for the prevention of conception or for causing unlawful abortion . . ." is guilty of a felony. The defendant, a registered pharmacist, sold some condoms to a police officer who purchased them for the purpose of holding them as evidence. It was admitted by both the defendant and the commonwealth, in a subsequent prosecution of the defendant for violating the foregoing law, that the condom is medically recognized and regarded as a venereal disease preventive and that it is sometimes used to prevent conception as well. The commonwealth produced no evidence indicating that the defendant intended the object of the sale to be used for any unlawful purpose. On this evidence, the defendant was found guilty of the charge against him and appealed to the Supreme Judicial Court of Massachusetts.

The commonwealth contended that since the articles sold by the defendant were susceptible of use for an unlawful purpose, and often were used for that purpose, the mere fact that they were equally susceptible of a lawful use should be disregarded and the sale should be condemned as the sale of articles "for" the prevention of conception. The defendant, on the other hand, contended that the word "for," as used in the law, referred to the intent of the vendor. He argued that the sale of articles susceptible of both a lawful and an unlawful use could not be declared unlawful without actual proof that the vendor knew, at the time he made the sale, that they were going to be used for the unlawful purpose. He also suggested that the commonwealth's construction would include within the prohibition of the statute the sale of many familiar, and almost necessary antiseptic, hygienic and sterilizing articles, since such articles were

likewise susceptible of being used to prevent conception. The Supreme Judicial Court admitted that the difficulty in this case resulted from the fact that the articles sold by the defendant were not used exclusively either for the prevention of conception or for the prevention of disease. The declared public policy of Massachusetts, the court said, is offended by the sale of articles intended to prevent conception; it is also offended by the unchecked spreading of venereal disease, even among those who indulge in illicit sexual intercourse. The insertion of the words "drug" and "medicine" in the law, said the court, made necessary some change in grammatical construction, and precluded, after the words "for self-abuse," the simple adding of the words "or for the prevention of conception or for causing unlawful abortion," and thus making the phrase "intended to be used" patently applicable to all three purposes. To the court there was reason to believe that the words "intended to be used" were in effect to be understood before the word "for" in the two instances in which they are omitted in the law. They may have been omitted, continued the court, either because to repeat them would have made the wording cumbrous or because the word "for" by itself conveys the same idea of intent or purpose.

The court thought that an indication of legislative intent was shown by the fact that in the law the prohibition of the sale, etc., of an "instrument or article . . . for the prevention of conception" is followed immediately by the words "or for causing unlawful abortion." The same instrument or article that would cause a lawful abortion would doubtless cause an unlawful one, the court pointed out, and if a dealer in surgical instruments should be accused of selling to a surgeon an instrument "for" causing unlawful abortion, an inquiry would necessarily be opened as to the purpose for which the particular instrument was sold and intended to be used. It would be strange to hold, the court concluded, that intent and purpose are material in construing the word "for" in the phrase "for causing unlawful abortion," and immaterial in construing the same word in the phrase "for the prevention of conception." The Supreme Judicial Court therefore agreed with the construction contended for by the defendant and reversed the judgment of conviction.—*Commonwealth v. Corbett*, 29 N. E. (2d) 151 (Mass., 1940).

Osteopathy: Right of Osteopath to Prescribe Narcotics.—The narcotic act of Pennsylvania provides that its proscriptions shall not apply to "licensed physicians" in the regular course of their practice. The act does not define the term "licensed physicians." The defendant, a licensed osteopath, was indicted for prescribing morphine sulfate in violation of that act. The trial court entered an order sustaining the defendant's demurrer and quashing the indictment, and the commonwealth appealed to the superior court of Pennsylvania.

The defendant contended that a person duly licensed to practice osteopathy was a "licensed physician" within the meaning of the narcotic act. The accepted definition of a "physician," said the superior court, is "a person skilled in physic or the art of healing; one duly authorized to treat diseases, especially by medicines." The court admitted that the word "physician" is most frequently used to refer to a doctor of medicine but said that it also includes the adherents of other schools authorized to treat diseases. Under the Pennsylvania osteopathic act, the court pointed out, osteopathy is recognized as "a complete and independent scientific system." In no less than seven instances in the body of that act, said the court, persons licensed to practice osteopathy are referred to as "osteopathic physicians." Such classification in the very act determining an osteopath's qualifications is, held the court, conclusive evidence that "licensed osteopaths" are "licensed physicians" and therefore within the exception to the prohibitions of the narcotic act. In conclusion, the court advised that if the defendant had exceeded his authority as an osteopath when he prescribed narcotics, "as the information tends to indicate," he should have been charged with practicing medicine without a license rather than with violating the narcotic act.

In a dissenting opinion, two judges pointed out that, under the Pennsylvania statutes, an "osteopath" is defined as an individual licensed "to practice osteopathy," an "osteopathic surgeon" as one licensed "to practice osteopathy and osteopathic surgery," and a "physician" as one licensed "to engage in the practice of

medicine and surgery in any or in all of its branches." These definitions clearly indicated to the dissenting judges that the terms "osteopath," "osteopathic surgeon" and "physician" have three different and distinct meanings. The osteopathic act specifically provides that osteopathy "opposes the introduction of drugs into the body organism as curative agencies" and that the practice of osteopathy is not to be construed as the practice of medicine. Since osteopaths do not practice medicine and do not administer drugs or medicine in the regular course of their practice, continued the dissenting opinion, no specific exception in favor of osteopathy was thought necessary or advisable by the legislature when it enacted the narcotic act. Commenting on the reasoning of the majority based on the fact that the osteopathic act refers to its licentiates as osteopathic physicians, the dissenting judges also pointed out that the veterinary act refers to its licentiates as veterinary physicians. Using the same analogy as that found in the majority opinion, said the dissenting judges, it would be necessary to conclude that the word "physician" in the narcotic act included veterinarian and, in the opinion of these judges, "that was not intended, and is not the fact."

Pursuant to the majority opinion, the judgment in favor of the defendant was accordingly affirmed. Subsequently the Supreme Court refused to entertain an appeal by the commonwealth.—*Commonwealth v. Cohen*, 15 A. (2d) 730 (Pa., 1940).

Malpractice: Blindness Attributed to Refrigerant; Treatment Allegedly Negligent.—As the plaintiff was attempting to repair an electric refrigerator, an explosion occurred and the refrigerant, sulfur dioxide, came in contact with his eyes. The defendant physician was immediately called and arrived at the plaintiff's home in about fifteen minutes. In the meantime the plaintiff applied a wet compress to his eyes. When the defendant appeared the plaintiff explained how the accident had happened and said he thought the refrigerant was ammonia. The defendant examined the refrigerator however and told the plaintiff that he didn't think it contained ammonia but that he wasn't sure what kind of gas it was. He then made as thorough an examination of the plaintiff's eyes as was possible under the circumstances but did not render any treatment. The plaintiff was advised to stay outside in the fresh air and sunlight for a "couple of hours." At no time during the defendant's visit did the plaintiff complain of any pain. Shortly thereafter, however, the plaintiff experienced pain in his eyes and difficulty in breathing. He was taken to a hospital, where for the next twenty-four hours various fluids of one kind or another were constantly injected into his eyes. No opiates were administered. When he left the hospital the next day he was totally blind, and his sight never returned. Subsequently the plaintiff sued the defendant physician for damages alleged to have been caused by the defendant's negligence. From a judgment for the plaintiff, the defendant appealed to the Supreme Court of Washington.

The essence of the plaintiff's contention was that the defendant did not exercise reasonable care and skill in that he failed to irrigate the plaintiff's eyes with water. Expert witnesses for both parties testified that sulfur dioxide on contact with moisture immediately forms sulfurous acid and that sulfurous acid is very destructive. The plaintiff's expert testified that, in an emergency, the safest thing to do was to throw clean water in the patient's face in an attempt to remove or dilute any fluid or gaseous irritant. He would not admit, however, that such action by the defendant would, either wholly or partly, have saved the plaintiff's vision, although he thought it would probably have diminished the pain. The Supreme Court recalled that the plaintiff had made no complaint of pain during the defendant's visit and further pointed out that during most of that time the plaintiff held a saturated bandage over his eyes. The experts who testified on behalf of the defendant stated that the action of sulfurous acid is so rapid that nothing the defendant could have done would have saved the plaintiff's eyesight. In fact one of them said that damage to the eyes from sulfurous acid is almost instantaneous, a matter of seconds rather than minutes, and that after "a period of a moment or two there would be practically no hope of retention of vision or restoration of vision." These witnesses

also warned of the danger of putting ordinary water, which is not sterile and free from bacteria, into an already injured eye.

The Supreme Court held that a physician is not liable merely for making a wrong diagnosis unless an improper treatment follows. Here the defendant could not be held liable, continued the court, for failing to treat a condition of which he was unaware when the evidence showed that, even if he had been fully advised, he would not have acted differently. In conclusion the court held that, in view of the serious disagreement among qualified experts as to the advisability of so doing, the defendant was not guilty of malpractice in failing to apply water to the plaintiff's eyes. The judgment for the plaintiff was accordingly reversed.—*Peddicord v. Lieser*, 105 P. (2d) 5 (Wash., 1940).

Dental Practice Acts: Extent of Board's Discretionary Powers.—The plaintiff applied for a writ of mandamus to compel the defendant Florida State Board of Dental Examiners to issue him a certificate to practice dentistry in Florida or, in the alternative, to produce in court the examination papers written at certain previous examinations conducted by the board and cause them to be regraded by such method as the court might deem proper. The petition alleged that the preliminary moral, scholastic and professional qualifications of the plaintiff had been duly accepted by the defendant board and that he had passed the required examination with a sufficiently high mark, but that the defendant, even after three examinations, illegally, unlawfully, capriciously and from prejudice "flunked" the plaintiff and refused to issue him a certificate to practice dentistry. The defendant filed a motion to quash the alternative writ and refused to plead further. The lower court entered an order overruling the defendant's motion and granting the writ, so the defendant appealed to the Supreme Court of Florida.

The Supreme Court said that when an applicant to take the examination for a certificate to practice dentistry has complied with all the requirements of the law and the board has approved his application and admitted him to the examination, it becomes the duty of the board to issue him a certificate if he makes the mark required to pass. The effect of the defendant's motion to quash was to admit as true all facts sufficiently pleaded in the plaintiff's petition. The character and qualifications of the plaintiff were therefore conceded. The Supreme Court admitted that the defendant was vested with some discretionary powers. When an applicant applies and presents his credentials to take the examination, the board is the judge of these and it may reject the applicant if not shown to meet all the requirements. After he has qualified and passed the examination, in the absence of adverse showing, he cannot be deprived of a certificate. Administrative boards, the court pointed out, are vested with no such arbitrary hegemony over individual rights as was charged in this case. "Ours is still a government of laws and not one of men actuated by caprice and arbitrary power. The highest duty of the man or board whose duty is to administer laws, rules or regulations is to see that they bear equally on all persons or groups." Accordingly the Supreme Court held that the writ of mandamus had been properly issued and the judgment for the plaintiff was therefore affirmed.—*York v. State ex rel. Jones*, 107 So. 766 (Fla., 1940).

Medical Practice Act: Suspension of License for Assisting Unlicensed Person to Practice.—The Board of Regents, on the basis of a report by the Committee on Grievances, suspended for six months the defendant's license to practice medicine in the state of New York. It appeared from the evidence that the defendant collaborated with a chemist in attempting to remove a birthmark by the application of a new preparation, the formula for which was secret to the defendant and the chemist. The defendant permitted the chemist to treat and administer the preparation to the patient. The supreme court, appellate division, third department, New York, held that by this conduct the defendant assisted an unlicensed person to practice medicine unlawfully. The judgment of the Commissioner of Education, suspending the plaintiff's license to practice medicine, was therefore affirmed.—*La Roc v. Board of Regents of University of State of New York*, 23 N. Y. S. (2d) 265 (A. D., 1940).

Society Proceedings

COMING MEETINGS

- Alabama, Medical Association of the State of, Montgomery, Apr. 21-23. Dr. D. L. Cannon, 519 Dexter Avenue, Montgomery, Secretary.
- American Association for the Study of Gout, Atlanta, Ga., June 1-3. Dr. Thomas C. Davison, 478 Peachtree St. N. E., Atlanta, Ga., Secretary.
- American Association for the Study of Neoplastic Diseases, Winston Salem, N. C., April 23-25. Dr. Eugene R. Whitmore, 2139 Wyoming Ave. N. W., Washington, D. C., Secretary.
- American Association for the Surgery of Trauma, Boston, June 4-6. Dr. Gordon M. Morrison, 520 Commonwealth Ave., Boston, Secretary.
- American Association of Genito-Urinary Surgeons, Hershey, Pa., May 27-29. Dr. Charles C. Higgins, 2020 East 93d St., Cleveland, Secretary.
- American Association of Industrial Physicians and Surgeons, Cincinnati, Apr. 13-17. Dr. Edward C. Holmblad, 28 East Jackson Blvd., Chicago, Managing Director.
- American Association of the History of Medicine, Atlantic City, N. J., May 3-5. Dr. Henry E. Sigerist, 1900 East Monument St., Baltimore, Secretary.
- American Association on Mental Deficiency, Boston, May 13-16. Dr. Neil A. Dayton, 100 Nashua St., Boston, Secretary.
- American College of Physicians, St. Paul, Apr. 20-24. Mr. E. R. Loveland, 4200 Pine St., Philadelphia, Executive Secretary.
- American Dermatological Association, Hot Springs, Va., May 31-June 4. Dr. Harry R. Foerster, 208 East Wisconsin Ave., Milwaukee, Secretary.
- American Federation for Clinical Research, Minneapolis, Apr. 20-21. Dr. Thomas M. Durant, 3401 North Broad St., Philadelphia, Secretary.
- American Laryngological Association, Atlantic City, N. J., May 25-27. Dr. Charles J. Imperatori, 108 East 38th St., New York, Secretary.
- American Laryngological, Rhinological and Otolological Society, Atlantic City, N. J., June 1-3. Dr. C. Stewart Nash, 227 Alexander St., Rochester, N. Y., Secretary.
- American Medical Women's Association, Atlantic City, N. J., June 6-7. Dr. Ada Chree Reid, 102 East 22d St., New York, Secretary.
- American Neurological Association, Chicago, June 4-6. Dr. Henry A. Riley, 117 East 72d St., New York, Secretary.
- American Ophthalmological Society, Hot Springs, Va., June 1-3. Dr. Eugene M. Blake, 303 Whitney Ave., New Haven, Conn., Secretary.
- American Orthopedic Association, Baltimore, June 3-6. Dr. Charles W. Peabody, 474 Fisher Bldg., Detroit, Secretary.
- American Otolological Society, Atlantic City, N. J., May 28-29. Dr. Isidore Friesner, 101 East 73d St., New York, Secretary.
- American Pediatric Society, Sky Top, Pa., Apr. 30-May 2. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.
- American Psychiatric Association, Boston, May 18-22. Dr. Winfred Overholser, St. Elizabeths Hospital, Washington, D. C., Secretary.
- American Society for Clinical Investigation, Atlantic City, N. J., May 4. Dr. Eugene M. Landis, University of Virginia Hospital, Charlottesville, Va., Secretary.
- American Society of Clinical Pathologists, Philadelphia, June 5-7. Dr. Alfred S. Giordano, 531 North Main St., South Bend, Ind., Secretary.
- American Therapeutic Society, Atlantic City, N. J., June 4-6. Dr. Oscar B. Hunter, 1835 Eye St. N. W., Washington, D. C., Secretary.
- American Urological Association, New York, June 1-4. Dr. Clyde L. Deming, 789 Howard Ave., New Haven, Conn., Secretary.
- Arizona State Medical Association, Prescott, May 25-30. Dr. W. Warner Watkins, 15 East Monroe St., Phoenix, Secretary.
- Arkansas Medical Society, Hot Springs National Park, Apr. 27-29. Dr. W. R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.
- Association of American Physicians, Atlantic City, May 5-6. Dr. Hugh J. Morgan, Vanderbilt University Hospital, Nashville, Tenn., Secretary.
- California Medical Association, Del Monte, May 4-7. Dr. George H. Kress, 450 Sutter St., San Francisco, Secretary.
- Connecticut State Medical Society, Middletown, June 3-4. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.
- Florida Medical Association, Hollywood, Apr. 13-15. Dr. Shaler Richardson, 111 West Adams St., Jacksonville, Secretary.
- Georgia, Medical Association of, Augusta, Apr. 28-May 1. Dr. E. D. Shank, 478 Peachtree St. N. E., Atlanta, Secretary.
- Illinois State Medical Society, Springfield, May 19-21. Dr. Harold M. Camp, 224 South Main St., Monmouth, Secretary.
- Iowa State Medical Society, Des Moines, Apr. 15-17. Dr. Robert L. Parker, 3510 Sixth Ave., Des Moines, Secretary.
- Kansas Medical Society, Wichita, May 11-14. Mr. C. G. Munns, 112 West Sixth St., Topeka, Executive Secretary.
- Louisiana State Medical Society, New Orleans, Apr. 27-29. Dr. P. T. Talbot, 1430 Tulane Ave., New Orleans, Secretary.
- Maryland, Medical and Chirurgical Faculty of, Baltimore, Apr. 28-30. Dr. Richard T. Shierelford, 1211 Cathedral St., Baltimore, Secretary.
- Massachusetts Medical Society, Boston, May 26-27. Dr. Michael A. Tighe, 8 Fenway, Boston, Secretary.
- Medical Library Association, New Orleans, May 2-9. Mrs. Anna C. Holt, 25 Shattuck St., Boston, Secretary.
- Mississippi State Medical Association, Jackson, May 12-14. Dr. T. M. Dye, P. O. Box 295, Clarksville, Secretary.

- Missouri State Medical Association, Kansas City, Apr. 27-29. Mr. E. H. Bartelsmeyer, 634 North Grand Blvd., St. Louis, Executive Secretary.

- National Tuberculosis Association, Philadelphia, May 6-9. Dr. Charles J. Hatfield, 1790 Broadway, New York, Secretary.
- Nebraska State Medical Association, Omaha, May 4-7. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln, Secretary.
- New Hampshire Medical Society, Manchester, May 12-13. Dr. Carleton R. Metcalf, 5 South State St., Concord, Secretary.
- New Jersey, Medical Society of, Atlantic City, Apr. 21-23. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.
- New York, Medical Society of the State of, New York, Apr. 27-30. Dr. Peter Irving, 292 Madison Ave., New York, Secretary.
- New York State Association of Public Health Laboratories, Cooperstown, May 18. Miss Mary B. Kirkbride, New Scotland Ave., Albany, Secretary.
- North Carolina, Medical Society of the State of, Charlotte, May 11-13. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.
- North Dakota State Medical Association, Jamestown, May 18-20. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.
- Ohio State Medical Association, Columbus, Apr. 28-30. Mr. C. S. Nelson, 79 East State St., Columbus, Executive Secretary.
- Oklahoma State Medical Association, Tulsa, April 22-24. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.
- Rhode Island Medical Society, Providence, June 3-4. Dr. William P. Buffum, 122 Waterman St., Providence, Secretary.
- Society for the Study of Asthma and Allied Conditions, Atlantic City, N. J., May 2. Dr. W. S. Spain, 116 East 53d St., New York, Secretary.
- Pacific Coast Oto-Ophthalmological Society, Portland, Ore., May 11-14. Dr. C. Allen Dickey, 450 Sutter St., San Francisco, Secretary.
- South Carolina Medical Association, Myrtle Beach, May 19-21. Dr. Julian L. Price, 105 West Cheves St., Florence, Secretary.
- South Dakota State Medical Association, Sioux Falls, May 13-15. Dr. Clarence E. Sherwood, 107½ Egan Avenue South, Madison, Secretary.
- Tennessee State Medical Association, Memphis, Apr. 14-16. Dr. H. H. Shoulders, 706 Church St., Nashville, Secretary.
- Texas, State Medical Association of, Houston, May 11-14. Dr. Holman Taylor, 1404 West El Paso St., Fort Worth, Secretary.

CENTRAL SOCIETY FOR CLINICAL RESEARCH

Fourteenth Annual Meeting, Held in Chicago, Nov. 7 and 8, 1941

The President, DR. LAWRENCE D. THOMPSON,
St. Louis, in the Chair

(Continued from page 1246)

Treatment of Parathyroid Tetany

DR. ELMER L. SEVRINGHAUS, Madison, Wis.: Although it has been assumed that the best substitution therapy in hypoparathyroidism is the use of dihydrotachysterol, a recent discussion by McLean indicates that vitamin D is equally effective. Observations on 3 patients with post-thyroidectomy tetany and 1 with idiopathic hypoparathyroidism confirm this point of view. The approximate equivalence in potency is between 1 mg. of dihydrotachysterol (of commercial grade) and 40,000 international units of vitamin D. Comparison of retail costs shows that therapy with the vitamin preparations would cost from \$2 to \$8 as against \$1 for dihydrotachysterol. The greatest differential exists when the two types of material are secured from the same manufacturer. The advantages of using calcium chloride rather than the lactate, gluconate or phosphate as adjuvants in treating tetany are also demonstrable. Doses of 1 Gm. of the chloride are well tolerated if the salt is taken in the form of a 25 per cent solution in syrup of glycyrrhiza.

DISCUSSION

DR. ROBERT W. KEETON, Chicago: My associates and I have had an unusually interesting case of tetany under observation for a period of approximately four years. The patient had high grade mitral stenosis with but little cardiac reserve. In the days when total thyroidectomy was popular, this operation was performed on her. After the operative procedure she had a great deal of difficulty with tetany and decompensation. The decompensation did not respond to digitalis or to adequate doses of thyroid. We were able to establish compensation by the use of calcium and by controlling the tetany. This experiment was repeated on several occasions; so it confirms in an interesting

way the problem dwelt on by Dr. Sevringhaus; namely, tetany in a heart on the border of compensation may be a factor in producing decompensation and its control a factor in maintaining compensation. This patient was taking 1,000,000 units a day of vitamin D; with indifferent success. We had continually to resort to calcium. We then changed to dihydrotachysterol with a better result, but the control was not entirely satisfactory. She was given a low phosphorus diet with much greater success. While she was on this regimen pellagra developed, which was controlled by therapy with nicotinic acid. At present she is on a general diet and takes a colloidal suspension of aluminum hydroxide and dihydrotachysterol, and her condition is well controlled.

DR. E. PERRY McCULLAGH, Cleveland: In the treatment of parathyroid tetany it is a practical matter indeed to give the patient as much calcium as possible because all other forms of treatment are expensive. We believe that more total calcium can be given to the patient as calcium lactate than as calcium chloride because as a rule the patient tolerates the lactate much better. In the majority of cases tetany will be completely controlled without any other measures if the patient is given sufficient calcium. Apparently a patient can take large doses of calcium lactate for many years without any disturbance. Our patients with severe tetany are given as much calcium lactate as 3 heaping teaspoons four times a day. This supplies a great deal of calcium, and it would be difficult to give the same amount in the form of calcium chloride. It occasionally happens that the patient does not tolerate calcium lactate in powder form; a simple solution can then be made at home by boiling the drug in water.

DR. CYRIL M. MACBRYDE, St. Louis: I have had the same problem that Dr. Sevringhaus has been describing here. Another practical point is that it is important to keep these patients on a diet as nearly normal as possible. It is not well to keep the patient on a low phosphorus diet all the rest of his life. It is well to supply milk even though it does give the patient a pretty good phosphorus intake. The patient may take a quart of milk a day. I used to use a lot of phosphorus diets and restrict milk, before dihydrotachysterol and vitamin D were available. My experience is that it is no longer necessary to keep the patient on a low phosphorus diet. I believe the condition is more completely and more satisfactorily controlled if the patient is given an ordinary diet. I find that large doses of calcium lactate can be easily taken by patients with parathyroid tetany, and vitamin D can be given; so the control is completely satisfactory. I have not seen what Dr. Sevringhaus has spoken of as an unstable blood calcium level. It has been my experience that the blood calcium level has been stable. It has remained practically stable for years in patients given dihydrotachysterol or vitamin D or 10 to 15 Gm. of calcium lactate by mouth a day and no additional phosphorus.

DR. FREDERICK S. COOMBS, Youngstown, Ohio: I have had occasion recently to treat a woman with tetany from postoperative causes. At the start of therapy the blood calcium was 5 mg. per hundred cubic centimeters. In ten days, with the use of dihydrotachysterol and a quart of skimmed milk a day, the blood calcium came up to 8.6 mg. and she was relieved of her symptoms. I have not used additional calcium by mouth. I wonder whether this calcium is not excreted in the intestine.

DR. ELMER L. SEVRINGHAUS, Madison, Wis.: One of the issues that comes of this discussion is the definition of complete control of tetany. It is not as easy to describe as complete control of diabetes or of hypothyroidism, but it ought to be attempted clinically. Complete control does not mean only that there is freedom from tetanic symptoms. This can be confirmed by observations made by the patients given calcium who have no tetanic seizures. They are made much better by therapy with solution of parathyroid, vitamin D or dihydrotachysterol. The definition of complete control needs to be studied. I feel that when the cost of materials becomes lower so that vitamin D or dihydrotachysterol can be used in optimal levels over a

long period, one can secure stability resembling the normal. That is what would be expected if one can supply the deficiency. To date I have had to use minimal doses to secure fair health rather than excellent health. If one can give optimal doses of vitamin D, one can study calcium absorption from the bowel and find how much calcium is necessary for a normal intake.

The Distribution of Serum Proteins in Hepatic Diseases as Determined by Electrophoresis

DRS. SEYMOUR GRAY and E. S. GUZMAN-BARRON, Chicago: When serum proteins are subjected to the action of an electric current at low temperatures and in well buffered solutions they migrate according to their electric mobilities. This property was taken advantage of by Tiselius to separate and measure quantitatively the concentration of the different proteins which exist in the blood serum. The Tiselius electrophoresis apparatus, as modified by Longworth, has been used to study the distribution of the proteins in the blood serum of patients with a variety of diseases of the liver. Electrophoresis patterns of the serum of patients with acute hepatitis reveal an alteration of the distribution of albumin and of the three globulins, alpha, beta and gamma; in most cases in which the albumin-globulin ratio was normal there was observed a large increase of gamma globulin. In cases of cirrhosis of the liver there was an increase of beta and gamma globulin; in cases of stone of the common bile duct and severe jaundice the beta globulin was increased; changes were also observed in cancer of the liver.

Palindromic Rheumatism

DRS. PHILIP S. HENCH and EDWARD F. ROSENBERG, Rochester, Minn.: Features of this disease are multiple afebrile attacks of acute arthritis, periartthritis and sometimes also para-artthritis, with pain, swelling, redness and disability of generally one, sometimes several, small or large joints in an adult of either sex. Attacks appear suddenly, develop rapidly, generally last only a few hours or days and then disappear completely but recur at short or long irregularly spaced intervals. Despite the transitory presence of an acute or a subacute inflammatory reaction in joint tissues and a fibrinopurulent exudate in the articular cavity, little or no constitutional reaction of abnormality is evidenced by the results of laboratory tests, and no significant functional, pathologic or roentgenographic residues occur even after years of disease and scores or even hundreds of attacks.

Of 34 patients, 19 were female and 15 male. Patients were aged 13 to 68 (generally 20 to 39) at the onset of the disease, which at the time of their admission to the Mayo Clinic had lasted from three months to twenty-five years (the average was seven years). Attacks had occurred at the rate of two to ten yearly in 9 cases, twenty to sixty yearly in 17 cases, one hundred to two hundred yearly in 3 cases and two hundred and fifty or more a year in 5 cases. Four patients had had "hundreds" of attacks; the other 30 had had at least four thousand, nine hundred and thirty attacks and an average of at least one hundred and sixty-four attacks per patient within the average of seven years of illness, or twenty-three attacks per patient yearly.

Attacks lasted usually one to three, rarely more than seven, days. The intervals between attacks varied from a few days to six months. In 90 per cent of the cases the attacks were monoarticular and chiefly in a finger, wrist, shoulder, knee, toe or elbow. Pain was mild to severe; temporary disability was often considerable. Para-articular inflammation of short duration (six to twenty-four hours) at characteristic sites affected 10 patients. Intracutaneous or subcutaneous nodules were present transiently in 3 cases. Anorexia, loss of weight, anemia, leukocytosis and eosinophilia (the last in both blood and tissues) were absent. The sedimentation rate was normal or slightly elevated; moderate lipemia was present. Roentgenograms of joints revealed nothing abnormal. Biopsies showed acute inflammation during attacks but no gross or microscopic abnormalities between attacks; cultures of tissue removed were sterile.

The cause of the disease was not determined. The hypothesis that allergy was the causative factor could not be proved. The disease was distinguished from rheumatoid arthritis, intermittent hydrarthrosis, gout, angioneural arthrosis (Cohen, 1913) and the "allergic rheumatism" of Kahlmeter (1939). Of the many remedies tried none gave impressive results; fever therapy may have modified the condition somewhat. Follow-up data in 27 cases indicated that, although spontaneous cure occasionally occurred, the condition tended to continue with its pattern relatively unchanged, but permanent crippling did not occur despite thousands of attacks suffered during a total of three hundred and seven years of illness (two hundred and forty-two years before plus sixty-five years after admission).

DISCUSSION

DR. RICHARD H. FREYBERG, Ann Arbor, Mich.: The syndrome which Dr. Hench has described is indeed interesting. I would urge that every one who sees patients with rheumatic disease keep this description in mind and attempt to identify the condition. It is my belief that there are different types of inflammatory joint disease whose cause is not known, all of which are commonly called "rheumatoid arthritis" even though the syndrome does not have many of the characteristics of rheumatoid arthritis. In other words, I wonder if rheumatoid arthritis is not the wastebasket into which various types of rheumatic disease incompletely understood and not readily identified as distinct forms of rheumatism are unjustifiably thrown. Certainly the condition in the cases described by Drs. Hench and Rosenberg does not seem to be like the commonly recognized types of rheumatic disease. The follow-up study of these cases will be interesting. I should like to ask whether there is any tendency for this disease to occur in families.

DR. LEE FOSHAY, Cincinnati: Was there opportunity to try animal transmission experiments with materials obtained from any of these patients?

DR. LAWRENCE D. THOMPSON, St. Louis: I have been following a patient in St. Louis for nine months whose condition unquestionably corresponds to the condition described. There are two interesting facts in this case. In the first place, Dr. Foshay might be interested to know that the agglutinations for the patients with undulant fever were positive in a dilution of 1:120. The second point is that, by merely prescribing for this patient a diet from which I had eliminated six or eight foods which in my own experience have been most common allergic offenders, I was able to reduce the symptoms from daily attacks to sudden unexplainable attacks at weekly or biweekly intervals. In other words, I seemed to get some improvement by working along the allergy line. I should like to know whether Dr. Foshay has seen patients with undulant fever with symptoms similar to those described by Dr. Hench.

DR. PHILIP S. HENCH, Rochester, Minn.: We found no familial or hereditary features in this disease. To answer Dr. Foshay's question, we could not prove the infective nature of palindromic rheumatism. The attacks bore no relationship to acute exogenous infections, such as sore throats and influenza. Most of the patients had had their foci of infection removed without relief before we saw them. Cultures of material from remaining foci revealed no significant organisms; the bacteria found therein produced no positive cutaneous reactions in patients or significant lesions in animals. Cultures of material removed for biopsy were sterile. However, we did not do what Dr. Foshay suggests, i. e. grind up a nodule or other affected tissue and use this material for inoculation experiments. We will try to do that. Agglutination tests for *Brucella abortus* were made in 5 cases: they gave negative results in 4 and a slightly positive result (1:80) in 1, a reaction of doubtful significance. None of our patients had fever. I agree with Dr. Thompson that the allergic hypothesis seems attractive. We did our best to prove it but could not do so. Points against the allergic hypothesis were (1) the complete absence of orthodox clinical allergy in many of the cases, (2) the generally negative cutaneous reactions to various antigens including suspected foods, (3) the absence

of eosinophilia in blood or affected tissues, (4) the lack of resemblance between the pathologic reactions we noted in palindromic rheumatism and those in conditions known to be allergic (for example, urticaria), (5) the generally negative effect of epinephrine and histaminase and of histamine desensitization, (6) the negative provocative effect of histamine in large doses and (7) the negative results of provocative and therapeutic tests with suspected foods. One or two of our patients felt somewhat better (perhaps having fewer, shorter attacks) when they adhered to a diet free of suspected food antigens; the diet certainly did not stop the disease, although it may have modified it. I fully agree with Dr. Thompson that further investigation along the lines of allergy in this disease are in order, but my colleagues at the Mayo Clinic in the section for allergic diseases have about despaired of proving the presence of allergy. It is of special significance that 3 of our patients were physicians; they had been long puzzled as to the nature of their disease and had long since rejected as entirely inappropriate diagnoses such as rheumatoid arthritis or those of other known diseases of joints.

Cerebral Oxygen Consumption Following Experimental Injury to the Head

DRS. JOHN L. LINDQUIST and GEORGE V. LEROY, Chicago: To investigate the pathogenesis of the symptoms of cerebral concussion, studies of the cerebral oxygen consumption and cerebral blood flow were made. A Rein type thermostromuhr was used to measure the cerebral minute blood flow, and the arteriovenous oxygen difference was determined manometrically on blood drawn simultaneously from an artery and a jugular vein. All experiments were performed on dogs lightly anesthetized with soluble pentobarbital. In the first experiments cerebral blood flow and oxygen consumption were measured at intervals from twenty to forty minutes after a severe cranial trauma. The usual result of the injury was a rapid and early decline in both the blood flow and the oxygen consumption. In a series of 8 dogs the decrease in the former value averaged 17 per cent and in the latter 24 per cent.

Another series of observations was made on 10 dogs whose heads were traumatized twenty-four hours earlier. At this time the following deviations from normal were observed: (1) The cerebral blood flow averaged 19 per cent below normal; (2) the cerebral oxygen consumption averaged 21 per cent below normal; (3) the arterial oxygen saturation was 73, 76, 78, 81, 84, 89 and 91 per cent, respectively, in the dogs for which it was determined. It was apparent from the data that the altered oxygen consumption of the brain was not due to stasis or to arterial hypoxemia but was due to an inability of the brain to utilize the gas.

The fact having been established that the cerebral oxygen consumption and blood flow were still subnormal twenty-four hours after injury, it was desirable to observe the influence of two commonly used therapeutic agents on these functions. Four of the animals studied twenty-four hours after injury were given hypertonic sugar solutions, and from 3 cerebrospinal fluid was removed by cisternal drainage. Three animals were used for controls. The injections of hypertonic solutions of dextrose and sucrose had no effect on the blood flow. This is in accord with other investigators' studies. The effect on oxygen consumption, however, was striking. With 50 per cent sucrose solution, oxygen utilization increased by 45 and 100 per cent. With dextrose the increases were 90 per cent and 130 per cent respectively. After cisternal drainage there was a 25 per cent improvement in the cerebral blood flow. The oxygen consumption increased 100 per cent and 260 per cent in 2 instances. For technical reasons there was no apparent change in the third animal. Suitable control experiments were performed.

These experiments demonstrate a physiologic basis for the altered cerebral activity after injury to the head severe enough to cause concussion. They show also that if reduced cerebral oxygen consumption occurs it may be corrected by the administration of hypertonic solutions of dextrose and sucrose or by the drainage of cerebrospinal fluid. We think that these experi-

ments in addition to suggesting a reason for the alterations in consciousness suggest also a rational basis for the use of two common therapeutic agents.

The Use of Poudrage in Chronic Pneumothorax and Cystic Disease of the Lung

DR. DAN W. MYERS, St. Louis: In 25 of 45 instances of spontaneous pneumothorax observed the pneumothorax was of the so-called benign variety unaccompanied by recognizable pulmonary disease. Prompt closure of the pleuropulmonary communication and reexpansion of the lung ensued in all but 1 case. After protracted rest, intrapleural instillations of blood and dextrose and the trauma of thoracoscopic inspection of the pleura had failed to produce closure of the fistula, pleural poudrage was carried out, 5 Gm. of iodized talc being sprayed into the pleural space. Prompt sealing of the pleuropulmonary communication and reexpansion of the lung resulted. The belief is expressed that iodized talc is a more effective agent for the production of aseptic pleuritis than the agents previously employed in the obliteration of such fistulas. Treatment of a giant tension cyst of the lung by means of intracystic powdering with iodized talc also was successful.

DISCUSSION

DR. WILLIAM H. BUNN, Youngstown, Ohio: In 1924 I had a patient aged 46 who had dyspnea produced by a collection of fluid in the right side of the chest. On withdrawal of the fluid there were many cholesterol crystals; their presence, of course, suggested that the fluid had been present for months or years. Repeated withdrawal of the fluid meant only that it recurred. Artificial pneumothorax was instituted after each withdrawal of fluid. Still the fluid kept forming. The patient unfortunately had a fall down several steps and struck her side forcibly enough to tear the lung. After this high air pressure built up in the right thoracic cavity. This required aspiration on several occasions. Finally gomenol (a cajuput oil from *Melaleuca viridiflora*) was instilled, adhesions quickly formed and complete recovery occurred. In 1 other case gomenol was successfully instilled into the pericardial sac of a boy who had required (until this measure was instituted) repeated tapings to relieve the pressure of accumulations of pericardial fluid. There is a place in clinical medicine for some stimulant to the formation of adhesions.

Urea and Sulfonamide Urolithiasis

DRS. SIDNEY S. SOBIN, LAWRENCE M. ARONBERG and HARRY ROLNICK, Chicago: Previous studies on the solubility of the acetyl sulfonamides in human urine (presented before this society in November 1940) demonstrated that the solubility of these substances increased in urine of increasing specific gravity (or concentration). The probable relationship of this unusual phenomenon to an increasing amount of urea was suggested and evidence presented.

In the present work the effect of urea on the renal concretions resulting from the oral administration of sodium acetylsulfapyridine to white rats was studied. Animals receiving sodium acetylsulfapyridine with and without urea were studied for seven to nine days. Changes in weight, water intake and general nutrition were noted. Animals treated with sodium acetylsulfapyridine alone frequently presented hematuria which was not constant from day to day. Hematuria, however, was not observed in any of the rats receiving urea with the drug. The animals not receiving urea frequently appeared ill and listless and took their food poorly. This was not true of the urea treated rats.

Microscopic review of the kidney tissues revealed concretions in many of the animals receiving sodium acetylsulfapyridine alone. In animals receiving urea as well, no concretions were found. Extreme cloudy swelling and simple necrosis of the tubular elements and loops was encountered in the controls. This was only rarely seen in the urea treated rats.

It is suggested that urea has some solvent action on acetylsulfapyridine crystals *in vivo* as well as *in vitro*.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Venous Pressure and Circulation Time in Heart Failure.—Hussey and his co-workers made one hundred and eighty-five simultaneous measurements of the venous pressure and circulation time of 100 patients with congestive heart failure. The study shows that the venous pressure is abnormally elevated or shows a significant rise when the abdomen is compressed and that the arm to tongue and the arm to lung circulation times are usually prolonged. When clinical improvement occurs the arm to tongue circulation time may remain prolonged after all other signs of heart failure have disappeared. This presumably indicates the persistence of left ventricular failure. The study of 7 patients suggested isolated left ventricular failure; the venous pressure and the arm to lung circulation time were normal, but the arm to tongue circulation time was prolonged. Among 34 patients with general heart failure the lung to tongue circulation time was within normal limits. This tends to impair the value of this measurement in the diagnosis of isolated right ventricular failure. In heart failure the venous pressure may be abnormally high or rise significantly on abdominal compression when other signs of failure are lacking. Repeated measurements of the venous pressure and circulation time in heart failure afford an objective means of following the course of the disease and are necessary for accurate diagnostic appraisal. The measurements often can be of value in ruling out heart failure.

Effect of Boxing on the Heart.—Butterworth and Poindexter obtained electrocardiograms of 35 boxers (16 to 24 years of age) before and after bouts. Before a bout the average heart rate was 81, and after the bout it was 115 beats a minute. Sinus arrhythmia was common before matches but was absent or slight at the higher rates after the matches. After the exercise there was a definite increase in the height of P₂ and P₃ and a decrease in the size of the T waves. The study presents no evidence that boxing has any traumatic effect on the normal heart of the young boxer.

Fetal Electrocardiogram.—Ward and Kennedy made forty-six recordings of the fetal heart beat during various stages of intrauterine life. They used a three channel, balanced amplifier and crytograph, an instrument developed to record electroencephalograms. Three abdominal leads were usually employed and were placed to form an equilateral triangle over the uterus. The curves were recorded in ink on paper by the crytograph, a permanent record thus being made. No developing was necessary. The length of pregnancy was calculated by assuming that conception occurred fourteen days after the last normal menstrual flow began. The fetal deflections measure about 30 microvolts. The fetal waves usually appear in one lead. Deflections were produced in thirty-one of the forty-six records. The remainder showed no definite fetal deflections, except one which was questionable. No positive tracing was obtained earlier than the sixteenth week of pregnancy. There was a sharp dividing line between the positive and negative records near the end of the fourth month. From the sixteenth week thirty-eight records were taken, and thirty-one of these were positive. For comparison records were made of 1 woman on the same day with the ordinary electrocardiographic apparatus and with the Offner amplifier and crytograph. With the former instrument, even with double standardization, no fetal waves were shown, but good fetal waves were obtained with the crytograph. The method should prove useful in the diagnosis of pregnancy, in ascertaining whether the fetus is living, in the diagnosis of multiple pregnancy and, experimentally, as a tool for studying fetal physiology.

Atmospheric Conditions and Oral Mucosa.—Winslow and his collaborators determined the effect of various degrees of temperature and humidity on the mucous membranes of 4 subjects. With a vapor pressure of up to or above $\frac{1}{10}$ inch of mercury the moisture of the surface of the oral mucosa, depending on variations in temperature and humidity, varied from a moderately high to an extremely high value. The variations were attributed to the physiologic changes in the vascular system of the mucosa. With vapor pressures below $\frac{1}{10}$ inch there was a definite dryness of the oral mucosa; its surface moisture was about half that observed at higher vapor pressures. The authors conclude that a pronounced drying effect on the mucosa must occur at air temperatures below 53 F. with any moisture content, at 60 with less than 77 per cent relative humidity, at 70 with less than 54 per cent relative humidity and at 80 F. with less than 39 per cent relative humidity. Whether the drying effect is harmful has not been determined, but, if it is harmful, outdoor air in winter must have as serious

an effect as dry indoor air. The effect can be controlled indoors with an air temperature of 70 F and a relative humidity of more than 50 per cent.

Radiant Disinfection of Air.—The Wellcs and Wilder report experiments which demonstrate that confined atmospheres of habitations constitute a vehicle for the epidemic spread of contagion. During the four years in the Germantown Friends School and the one year in the Swarthmore public schools when the air of the schoolrooms was irradiated there was no epidemic spread of contagion among the highly susceptible primary school children, although contagion did spread among less susceptible groups of older children in other departments of the schools whose rooms were not irradiated. The results suggest that the occurrence of contagious diseases at unfavorable times (measles in midwinter, when the danger of complicating streptococcal infections is high) and in unfavorable situations (such as that of an army in barracks) can be prevented by irradiation of air.

Fetal Electrocardiography—Bernstein and Mann recorded heart beats of 100 fetuses whose mothers were unselected consecutive patients presenting themselves at an antepartum clinic at the fifth or sixth month of gestation. Only 13 mothers were seen before the fifth month. The instrument used was the "cardiette," an unusually sensitive amplifying apparatus capable of detecting deflections up to 6 cm per millivolt and having approximately six times the sensitivity of the standard string galvanometer. In only 2 cases were satisfactory fetal curves not exhibited at some time during pregnancy. Of one hundred and fifty-three tests performed on the 100 patients 75 per cent showed clearcut fetal curves. No positive electrocardiograms were obtained earlier than the fourth lunar month. The individual monthly percentage of positive results ranged from 53.8 to 96.5 per cent, the average from the fourth to the tenth lunar month was 77.8 per cent. In the last two months 96 per cent of forty-eight readings were positive. The fetal heart rate does not indicate the sex of the fetus, since the heart rates of infants of both sexes averaged 148.7 beats per minute. There was a tendency for a gradual but definite decline in the fetal heart rate to the eighth lunar month, from then on to delivery there was a slight rise. Fetal and maternal rates were not correlative, a change in one was not necessarily accompanied by a corresponding alteration in the other. The electrocardiogram furnished a reliable diagnostic test in pseudocyesis of the menopause, pregnancy suspected in amenorrhea with a large fibroid and huge ovarian cyst and in missed abortion. The electrocardiogram was successful in indicating fetal viability in 4

instances in which fetal movements were not felt and the fetal heart was inaudible. One multiple pregnancy was accurately diagnosed. Generally, fetal hearts show sinus arrhythmias and sometimes extrasystoles and varying degrees of partial block. A peculiar increased rate is produced in the presence of intra-uterine anomalies. In instances of doubtful viability an electrocardiogram is indicated before cesarean section is performed.

Renal Blood Flow in Toxemias—Dill and his associates determined the inulin and diodrast clearances of 8 normal pregnant women who were within one month of term, had had no previous history of hypertension or toxemia of pregnancy and had not had changes of blood pressure in the retinal vessels or albuminuria, of 10 patients who had albuminuria, the albumin in the urine amounting to more than 2 Gm a day, hypertension, edema and a rapid gain in weight but no antecedent history of "toxemia of pregnancy" and who were classified as having "severe preeclampsia," and of 10 patients who had moderate to definite hypertension, mild to moderate albuminuria, a previous history of hypertension and changes in the eyegrounds and whose previous pregnancies were classified as "toxic." In the "preeclamptic" and "hypertensive" patients the postpartum glomerular filtration tended to return to normal and the renal blood flow fell to a level definitely below normal. The same mechanism that produces hypertension without pregnancy probably is operative in the woman with "toxemia of pregnancy." Pregnancy modifies the disease quantitatively in that the renal blood flow is maintained despite moderate renal arteriolar constriction and qualitatively in that the afferent arteriolar tone is increased to a greater extent than in the nonpregnant hypertensive patient, but the differences are merely quantitative modifications of the same fundamental vascular abnormality.

Sterile and Fertile Periods in Women—Latz and Reiner present a compilation of the data of some 1,000 record calendars sent in within the last year and a half by women who kept written records of menstruation, coition and ovulation for a number of years. For example, seven hundred and eighty-four thirty day cycles were recorded for 342 women, these same women also had other cycles. Ovulation and the number of coitions had on the various days of the cycle were recorded. For example, the 223 women who had, collectively, seven hundred and twenty-four twenty-four day cycles had among them ten coitions on the second day after the onset of menstruation, thirty-two on the third, seventy-eight on the fourth and so on. All told, there were 11,249 cycles and 49,356 coitions listed with no conceptions. Practical proof that ovulation must occur at about the time generally believed, that the time for fertilization of the ovum is short and that the life of the sperm cells in the female genitals is limited to less than forty-eight hours is had from the records of these women. If this were not the case a number of pregnancies would have occurred, as it cannot be assumed that more than an average percentage of the couples furnishing the data were sterile. The authors believe that the data on 4,702 coitions of 114 couples (reported in THE JOURNAL, Oct 19, 1935, p 1241), on 11,222 coitions of 265 couples (Illinois Medical Journal 71:210 [March] 1937) and on 54,027 coitions (under discussion) executed during the sterile period support the evidence that abstinence during the fertile period (as originally propounded by Knaus) prevents conception.

Irradiation Pulmonary Fibrosis.—Widmann made a clinical and roentgenologic study of chests of 273 patients who had received irradiation to the chest for cancer. Pulmonary fibrosis with atelectasis was a permanent change and appeared in varying degree within two to twelve months after irradiation with an intensity of 1,600 to 2,000 roentgens in one cycle and with doses of 3,000 to 6,000 roentgens in two or more cycles to each of three or four cutaneous ports. Of the 273 patients, 62 showed roentgen evidence of fibrosis, and 53 of them had metastatic complications as revealed clinically, roentgenographically and/or at necropsy. Identical procedures of irradiation caused pulmonary fibrosis in only 9 patients who were clinically free from cancer from three to ten years. This is the approximate incidence of irradiation fibrosis for so-called normal lungs. Roentgen determination of irradiation fibrosis complicating and accentuating metastatic cancer or other possible pathologic factors (infection, arteriosclerosis and advancing age) are fraught with many complexities and inconsistencies; so interpretations and conclusions may be controversial. Standards of evaluation are only approximate estimations.

Carcinoma of Lower Lip.—Howes and La Rosa report 74 cases of cancer of the lower lip treated at the Brooklyn Cancer Institute between 1930 and 1940. Only 1 patient was a woman. The youngest patient was 32, and the oldest had passed his eighty-sixth year; the average age for the series was 62. Treatment for 59 of the patients had a satisfactory result, and that of 15 was a failure. The result was deemed satisfactory if after six months there was no evidence of extension. Three patients have died of intercurrent disease—heart disease, tuberculosis and the like—but with no evidence of recurrence or spread of the carcinoma. The result was considered a failure if local or metastatic spread of the cancer occurred. Of the other 8 patients who died in the (failure) series it is known that further extension to the submental or the submaxillary region of the cervical lymphatics developed before death. Many of these had carcinoma and osteomyelitis in the mandible. Surgical intervention and radium or roentgen therapy to the local lesion were equally efficient in producing a cure. If the local lesion is controlled, block dissection of the cervical lymphatics offers the greatest hope of cure.

Irradiation Sickness.—The various remedies that Steinberg used for alleviating irradiation sickness included slow irradiation technic, administration of liver extract or of vitamin B₁, screening and high sodium chloride intake. An analysis of 103 consecutive instances of irradiation sickness, based on the development of lassitude (for which 15 per cent is subtracted from the effectiveness of the drug or physical means), nausea (15 per cent subtracted), anorexia (15 per cent), vomiting (25 per cent) and exhaustion (30 per cent), shows that the slow technic (200 roentgens or less being given daily) was 82 per cent effective, therapy with sodium chloride (10 Gm. daily) 77 per cent, oral administration of liver extract 70 per cent, intramuscular administration of liver extract 51 per cent, vitamin B₁ therapy 44 per cent and screening had no effect. None of the methods appear specific; most of them are beneficial either through improvement of the general condition of the patient or through the psychic effect resulting from the added attention that the patient receives. In the recommendation of drugs or any other means for combating irradiation sickness one should take into consideration the condition of the patient, the area or site to be irradiated, the size of the ports, the number of roentgens given daily, the ratio of the scheduled to the total dose and the fact that irradiation sickness does not develop in many cases even though large daily and total doses are given.

Surveys of Chest.—Richards states that the roentgen examination of recruits for military service not only excludes carriers of the tubercle bacillus but obviates the breakdown of enlisted men in whom pulmonary lesions are unsuspected and protects the country from enormous hospitalization and pension expense. In Canada the 14 by 17 inch (35.5 by 43 cm.) film was accepted largely because of its almost universal availability. At first civilian roentgenologists donated their services, to whom \$2 was paid for the film, its development and the filing envelop. In Ontario it has been calculated that the approximate cost to find each case of tuberculosis was \$500. After that it costs the province approximately \$1,000 to treat each patient with minimal, \$3,000 for each with moderately advanced and \$5,000 for each with advanced tuberculosis. But in the case of a soldier in whom tuberculosis develops the expense is \$25,000. This includes his hospitalization, as for the civilian, his life pension and usually a living allowance for his wife and family. The author believes that nontuberculous pulmonary infection has received far too little attention. In the army nontuberculous infection can be as crippling as tuberculosis, and the hospitalization and pension cost is four to six times that for tuberculosis. Figures from the director general's office indicate that during the recruitment of 328,325 men the single 14 by 17 inch roentgenogram was responsible for the rejection of 5,273; 3,076 had tuberculous and 1,088 nontuberculous pulmonary disease, and the rest had cardiac or other conditions. There were eleven "personal" errors due to interpretation, and sixteen other errors were inherent in the method and unavoidable. Even if other errors are discovered later the single 14 by 17 inch roentgenogram has proved extremely accurate, and it is amply justified on economic grounds. Guided by the statistics of the last war, the investment of some \$600,000 for the roentgen survey has

resulted in a saving to the country of more than \$20,000,000. In one unit of 800 men, of which the author has knowledge, 20 had open tuberculosis. The roentgen examination of these men cost the country \$1,600 and might be said to have saved \$80,000 to \$100,000. The potential saving is far greater when the possibility of the infection of others is considered. Up to the end of May 1941, 895 men were discharged from the Canadian army because of pulmonary tuberculosis. Most of them were recruited before a roentgen survey of the chest was done as a routine.

Fluoroscopy.—Garland states that even the published data of ardent protagonists of fluoroscopy show that the relative accuracy of the method in diagnosing tuberculosis is much lower than is indicated by the conclusions of these authors. Physical, psychologic and personal factors make fluoroscopy not sufficiently accurate for detecting active tuberculous lesions. The method is much more accurate than simple physical examination and is of definite value for detecting extensive or moderately advanced disease, especially when cavities are present. The percentage error of even expert fluoroscopy as compared to roentgenography varies from 13 to 35 per cent. Fluoroscopy in selected cases is essentially an adjunct to complete roentgen examination.

Roentgenoscopy of Lungs.—Stiehm presents cases which illustrate the advantages of roentgenoscopy: the proper position, the viewing of the lungs in several positions, which may disclose lesions at the periphery of the lung and those hidden by bones or other structures, and the advantage of magnifying a small lesion. The limitations of even the 14 by 17 inch stereoscopic film are revealed by roentgenoscopy. The tendency for relying on the posteroanterior roentgenogram, whether the miniature or the 14 by 17 inch, should be viewed with more caution and less enthusiasm. The miniature photograph is perhaps economically justifiable, but its limitations must be widely appreciated, especially if the small infiltrating lesion is to be found. Enlargement of the image, by magnification by roentgenoscopy and spot roentgenography, rather than its reduction appears more tenable. It is unfortunate that a tendency has developed to omit the tuberculin test, the earliest indication of tubercle formation, when mass roentgen surveys are made. Tuberculin tests should be repeated at yearly or more frequent intervals on all persons who react negatively to the test. With this routine the approximate time at which the infection occurred is known. The low cost of miniature films does not make the tuberculin test less valuable. It is not good medical practice to carry out mass roentgen ray surveys without knowing which persons are infected. The attempt to designate by a study of the roentgenogram which lesions typify significant pulmonary tuberculosis and/or arrested disease is hazardous and unfortunate and leads to errors of diagnosis. The minuteness of a tuberculous lesion does not indicate benignity. A study which includes history, physical examination and roentgenographic and laboratory data should not be considered complete unless the fasting patient's gastric contents are aspirated on three successive mornings and guinea pigs are inoculated. The presence of tubercle bacilli as determined by guinea pig inoculation indicates, with few exceptions, that the lesion seen in the roentgenogram is tuberculous and pathologically active.

Tuberculosis in the Southwest.—Dublin discusses the mortality in the racial groups (Negro, Mexican, Indian, Chinese, Japanese and Filipino) in the Southwest. In Louisiana the death rate from tuberculosis among Negroes for 1937 to 1939 was 102.5 per hundred thousand, in Texas 92.2 and in California 201.9, as compared to 38, 50.5 and less than 50, respectively, for the white population. The problem of tuberculosis among Mexicans is largely concentrated in Texas, New Mexico, Arizona and California. Data furnished by Texas authorities show that in 1937 to 1939 the death rate from tuberculosis in the Mexican population was 117.9. Data on the Spanish-American population in New Mexico are most unsatisfactory, for the certification of the cause of death is not efficient and in approximately 20 per cent of cases the cause of death is not stated or is ill defined. Werner found that deaths from tuberculosis among Mexicans in New Mexico accounted for more than two thirds of the total deaths in the state from this cause. In Arizona the death rate among Mexicans for 1937 to 1939, as reported by the state officials, was 145.8. In California the rate reported by the state officials was 199.9. The Indian population of Arizona, New Mexico and California is approximately 100,000, or 30 per cent of the total Indian population of the country. Arizona reports a death rate from tuberculosis among Indians of 280.5, New Mexico a rate of 200 and California a rate of 237.6. The death rate from tuberculosis among the Indians of Oklahoma, who make up about 30 per cent of the total Indian population of the country, for 1937 to 1939 was 154. The Japanese comprise nearly two thirds of the 200,000 persons of Oriental origin in California. The death rate from tuberculosis for the Japanese for 1937 to 1939 was 83.8, for the Chinese it was 179.8 and for the Filipinos it was 223.6 per hundred thousand. No permanent solution of the tuberculosis problem in the Southwest may be expected until the economic condition of the racial groups mentioned is improved and the diagnostic and curative facilities are expanded.

Familial Malformation of Appendix.—Downs reviewed histories of a family of 22 persons, descendants of 1 man to the third generation, on 16 of whom appendectomy had been performed. The same deformity has been observed in the excised appendix of each person. The family studied consists of a father, his 6 children and 15 grandchildren. The father, 4 of his 6 children and 11 of the grandchildren have been operated on. The operations were performed in various hospitals. The record

of each mentions a band of fibrous tissue at the base of the appendix with adhesion of the organ to the outer surface of the cecum. Strikingly good results followed the removal of the mechanically crippled appendix. The peritoneal bands may be inherited. The earliest symptoms of indigestion, abdominal pain, tenderness at McBurney's point and colic are probably due to a deranged intestinal function, such as pylorospasm or spastic colon, without organic changes in the appendical wall. The malformation alone is not sufficient to precipitate an attack of acute appendicitis. It may act as a predisposing cause, but some other etiologic factor must be present.

Hyperthyroidism and Hypertension.—Bisgard studied the blood pressure of 48 of 99 patients one year or more after a subtotal thyroidectomy, 32 of whom at the time of operation had a resting systolic pressure between 145 and 170 and the other 16 a pressure of 170 or more. The pressure of 19 of the first group one year or more after the operation was reduced considerably; the systolic pressure of 11 of these 19 was normal. The diastolic pressure of 17 and the systolic pressure of 5 decreased, and in 10 the diastolic pressure increased. In 2 there was no change in pressure. In 8 of the second group, both the systolic and the diastolic pressure after thyroidectomy were reduced and remained so for one to five years. In 4 of these the pressure was nearly normal. In 4 of the 8 remaining patients the pressure was increased, in 2 it remained the same and in 2 the decrease was extreme. From these data two types of cases are distinguishable: (1) a type in which hyperthyroidism and established hypertension coexist as unrelated entities and (2) a type in which the relief of the hyperthyroidism by subtotal thyroidectomy causes the systolic and the diastolic pressure to become much lower, normal or nearly normal. The relation of hyperthyroidism to hypertension in the second type of case is probably provocative; the hyperthyroidism merely precipitates or exaggerates the latent hypertension. In both types arteriolar disease, differing only in degree, is present. In the first type the arteriolar disease is more advanced and renders the vascular bed inadequate for even a normal volume of blood flow, and in the second type the hypertension is pre-tensive and in time progresses to the condition of the first type.

Autoplastic Splenic Implants.—Hamrick and Bush report the development of nodular splenic implants throughout the peritoneal cavity in a Negro boy of 9 after traumatic rupture of the spleen. The boy had fallen out of a tree and had struck his abdomen on the ground. This is the thirteenth case of similar nature described in medical literature. It is the author's opinion that in man the relative youthfulness of the splenic tissue is of prime importance in making the splenic pulp cells viable for autoplastic implantation and successful peritoneal grafting. Autoplastic transplantation of splenic tissue may not be the exception in persons who have survived trauma to the spleen incurred in their youth.

Chorionic Villi Implants.—Lazarus and Schiffrin cite the case of a woman of 25 who two years before admission had gone through an apparently normal pregnancy but had given birth to a dead fetus. Three months prior to her present illness she was free of abnormal symptoms, when vague abdominal pain ensued. Slightly less than four weeks before operation she was curetted for a supposed intrauterine pregnancy, having missed one menstruation. The abdominal pain became acute only twenty-four hours before operation. Operation revealed much blood and many clots in the peritoneal cavity. The tubes and ovaries, particularly the right, were studded with small nodules but presented no rent indicative of ectopic rupture. A section of omentum studied microscopically disclosed the tumors to be typical chorionic villi, different from chorioepithelioma. The benignity of the lesion was suggested by the fact that four Aschheim-Zondek tests gave negative results. Photomicrographs of the tumor disclose well differentiated villi which are not commonly present in chorioepithelioma but which characterize normal chorionic tissue. Furthermore, the cells were typical Langhans' syncytial cells. Also there was little evidence of invasion of the blood spaces by chorionic tissue, which is frequent in the malignant type of tumor. Study of the literature has failed to reveal a similar instance.

Krukenberg's Tumor.—From a review of the surgical, necropsy and clinical data on 44 patients with Krukenberg's tumor encountered at the Mayo Clinic from 1908 to 1938, Leffell and his colleagues conclude that the term should not be used. Since, however, this is likely to be employed, they suggest that all metastatic adenocarcinomas of the ovary be included under it. These tumors vary only in size and degree of malignant grade. Nearly all Krukenberg tumors will show some glandular structure if serial sections are made. The authors have always found mucus, evidenced by the presence of "signet ring" cells. The variation in glandular structure and mucus is largely dependent on the grade of the primary lesion. Metastasis may occur by spread through peritoneal lymphatic channels, by the retroperitoneal lymphatics, by infiltration of contiguous structures or by a process of peritoneal sedimentation. The predominant type of spread depends on the site of the primary lesion, the depth to which the wall of the primarily involved viscus has been invaded and the degree or grade of the primary lesion. Primary adeno-"colloid" carcinoma of the ovary rarely mimics Krukenberg's tumor. The stromal reaction seen in an ovary being invaded by carcinoma is comparatively typical. As for carcinoma elsewhere in the body, operation for a Krukenberg tumor perhaps offers more than does any other type of treatment. Although the surgeon is confronted with a hopeless situation, he must realize the value of palliation.

Hereditary Xanthomatosis.—Bloom and his co-workers discuss hereditary xanthomatosis as it occurred in 9 children of Syrian descent whose parents were second cousins. There had been 13 children; 4 are excluded from the survey, as 1 of them was still an infant and 3 had died at birth or shortly after. In 5 of the 9 remaining children xanthoma tuberosum developed before the age of 4. Of these 4 died more or less suddenly at the ages of 6½, 14, 18 and 23 years, respectively. The 1 surviving boy with xanthoma tuberosum has a cardiac defect and hypercholesterolemia. Of the 4 living children without cutaneous xanthoma a girl aged 8 years has heart disease and hypercholesterolemia, a boy of 4½ has hypercholesterolemia without any cutaneous or cardiac involvement and 2 children are apparently free of any abnormality. The parents of these tainted siblings had no cutaneous or cardiovascular symptoms, although the father had hypercholesterolemia. The mother had 8 half siblings, and 5 of them also had hypercholesterolemia. This appears to support the theory that hypercholesterolemia rather than xanthoma tuberosum is the principal directly inherited factor and that this disturbance of lipid metabolism under certain conditions leads to cutaneous and cardiovascular changes. The hereditary cause of the disorder has been demonstrated but no adequate statistical data are available that warrant a final analysis of the genetic mechanism involved. The taint distribution agrees with the theory of dominant inheritance, but it also can be explained by simple recessiveness. Genetic studies of affected families are essential for the development of successful therapeutic and preventive measures. A cholesterol-

free and fat-free diet may be helpful in protecting carriers of the hypercholesteremic trait against the development of cutaneous and cardiovascular lesions.

Estrogen for Tinea Capitis.—Poth and Kaliski successfully treated 18 boys and 12 girls having tinea capitis with diethylstilbestrol and theelin. There was no significant difference in the healing time and tolerance for the two preparations. The mechanism of the action of the estrogens is not known. It may be due to the temporary production of adult cells. This might explain the tendency for the spontaneous cure of tinea capitis at puberty. If estrogen causes changes in the scalp which increase its local resistance, its effectiveness might be increased by the concerted use of fungicides.

Hereditary Glaucoma.—Allen and Ackerman report 7 instances of hereditary glaucoma observed among 15 members of a family in which consanguine persons had not married and which was traced through three generations. The average age at which the glaucoma ensued was 11.6 years. The disorder was of the chronic simple type. Two of the 4 patients whose error of refraction could be determined had myopia; in 1 this was of more than 5 diopters in each eye, and in the other 1 the myopia varied from 1 to 5 diopters in the right eye. Miotics were insufficient; the best results were obtained with medical and surgical therapy. Early operation, goniotomy, before extensive visual damage occurs is important. Peripheral anterior synechias are unlikely unless considerable hemorrhage follows the operation. In the authors' cases goniotomy was effective without repetition in four eyes and apparently effective with one repetition in three eyes, and in one eye five goniotomies, two cyclodialyses and one deep root iridectomy were ineffective but iridencleisis was successful.

Otitic Bacterial Meningitis.—Weinstein discusses 39 cases of otitic bacterial meningitis with bacteria demonstrable in the spinal fluid encountered at the Jewish Hospital in the four years before the introduction of chemotherapy and in the four years afterward. The meningitis was usually associated with acute otitis, and generally the right side was involved. The otitis was acute in 34 and chronic in 5. The organisms most commonly isolated were streptococci and pneumococci. During the four years prior to 1937, 27 patients were encountered and not 1 recovered, but 4 of the 12 patients treated since 1937 have recovered. Modern chemotherapy for bacterial meningitis is one of the major achievements in its treatment, making the outlook for the future brighter.

Tonsillectomy and Poliomyelitis.—Seydell studied the relation of tonsillectomy to the development of poliomyelitis

(bulbar) as afforded by a survey of literature and various public health statistics. Definite conclusions cannot be drawn, as the data studied either support or oppose the theory that persons tonsillectomized during an epidemic of poliomyelitis are more prone to the disease or suggest that those whose tonsils have been removed are more susceptible to poliomyelitis irrespective of the time of the operation. The available statistics show that the bulbar form of the disease in 48 and the spinal form in 25 patients followed a recent tonsillectomy. The relationship of tonsillectomy to poliomyelitis cannot be determined without further study. Definite plans for the investigation of all epidemics of poliomyelitis should be formulated by trained epidemiologists, and an investigator should be appointed for each state. After an epidemic, statistics would thus become available through the various state boards of health.

Aeroinusitis.—Campbell states that in certain situations the paranasal sinuses are affected by changes in barometric pressure produced by changes in elevation and in weather. Normal paranasal sinuses surrounded by normal tissues are unaffected by these variations, but the presence of fluid in the sinuses or of redundant tissue in contact with the ostium of a sinus creates mechanical conditions which may lead to pathologic changes and symptoms. The term aeroinusitis is suggested for the condition.

*Encephalitis of Virus Etiology. J. H. Dingle, Boston.—p. 1014.

Arterial Occlusion and Effort.—Sprague and Westinghouse determined the exact effort that 75 patients in presumably good health were undergoing at the time of their arterial occlusion; 29 patients (with thirty attacks) had ocular symptoms and 46 (with forty-seven occlusions) did not have symptoms referable to the eye. The retinal picture of arterial blocking is that of ischemia, often with the characteristic cherry red spot at the macula. Although embolism of the central artery of the retina is a popular diagnosis, such embolism is relatively rare; obliterating endarteritis with thrombosis is the common cause. Fifteen of the 29 patients with occlusion of the retinal artery or its branches had rheumatic heart disease. Loss of sight of the right eye in 10 and of the left in 4 was sudden. In 1 the right retinal artery was occluded first and then the left. Only 2 of the patients were undergoing unusual physical effort when overtaken by blindness, 6 were engaged in mild exercise and 7 were at complete rest. There were 9 instances of hypertension and arteriosclerosis. The right eye of 5 and the left eye of 4 were involved. Two patients were doing household work, 1 stepped back from a slight furnace explosion, 1 was bending forward working on an automobile, 2 were dressing, 1 awoke with loss of vision, 1 was at the movies and 1 noticed loss of vision after turning his head quickly. Two of the remaining 5 patients had syphilis (both had a normal cardiac rhythm), and in 3 no cardiovascular disease was observed. One of the 2 patients with syphilis was ironing and 1 was walking about the house at the time of occlusion, 2 of the

others were at rest and 1 was walking. Of the 46 patients in whom the occlusion was not in the vessels of the eye 22 had rheumatic heart disease, and in none of them did the embolism occur during violent effort. In 2 it happened some time after unusual effort or 15 minutes after running for a trolley and in 1 after the patient had fixed a bed. In 9 others it occurred during mild effort (rising in the morning, driving a car, eating breakfast, playing golf and working as a baker) and in 11 during complete rest. Arteriosclerosis and/or hypertension was present in 23 patients, and 1 patient had no demonstrable cardiovascular disease. None of these patients were engaged in severe or unusual effort; in fact, 12 were at complete rest. It is seen that the sudden loss of sight or of the use of a limb or occlusion of cerebral or mesenteric vessels based on embolism or other arterial blockage occurred during ordinary daytime activities or when the patient was at rest in more than 9 of 10 patients. Unusual effort apparently is not the cause of arterial occlusion. Arterial blockage is as progressive when the patient is at rest as when he is active, perhaps more so.

Encephalitis.—Dingle states that the largest epidemic of encephalitis, affecting approximately 3,000 persons, of known origin occurred during the past summer and fall in an area encompassing the North Central states and Canadian provinces. In the outbreaks of von Economo's disease of unknown origin since 1916 three distinct viruses have been demonstrated. This has helped to clarify the problem of encephalitis. Only two types of virus encephalitis, St. Louis encephalitis and equine encephalomyelitis, other than poliomyelitis, have occurred in significant epidemics in this country. For only poliomyelitis and Australian X disease is evidence of potential animal reservoirs lacking, and vector transmission is possible for at least five of the viruses causing encephalitis in man. The acute encephalitis of virus origin that occur in epidemic form are so similar in their clinical aspects that differentiation on this basis is not possible except in poliomyelitis. The final etiologic diagnosis must be made with the aid of laboratory procedures. Treatment of all the encephalitis is at present chiefly symptomatic. The sulfonamide derivatives, specific antiserum, convalescent human serum, antistreptococcus serum and streptococcus vaccines have been tried for therapy and/or prophylaxis. In this country there are three methods of preventing epidemics of encephalitis: extermination of host reservoirs, extermination of vectors and immunization of susceptible hosts. The use of purified immune vaccine seems desirable for laboratory workers and for persons in areas where equine encephalomyelitis is endemic whose occupation offers frequent opportunity for infection with the virus. Vaccines that can be used safely in man are not yet available. Further investigation of the problems of prevention is essential, especially because of the military activities and concentration of men in training camps in areas where the disease is endemic.

Care of Patients with Incurable Cancer of Cervix.—Rousseau recommends the following twelve measures for relieving the pain of incurable cervical cancer: 1. The neurability

and hopelessness of the disease should be appraised correctly. 2. Ureteral obstruction, anuria and uremia should be prevented. 3. Pyometra should be prevented by gentle dilation of the cervix and lavage of the uterine cavity. 4. If a parametric abscess exists, colpotomy is indicated. 5. The urinary symptoms incident to involvement of the wall of the bladder and associated cystitis should be relieved. 6. High voltage roentgen therapy is necessary for painful osseous metastasis. 7. When sedation becomes necessary, acetylsalicylic acid, then codeine, cobra venom and finally morphine should be used. 8. Alcohol should be injected into the spinal subarachnoid space if sedation fails to give relief. 9. Treatment with a liquid diet and tincture of opium should be tried for proctitis, diarrhea and rectal tenesmus. 10. For the relief of the toxemia of severe infections, chills and fever the sulfonamides, blood transfusion, intravenous injections of fluid and frequent hot boric acid douches are helpful. 11. A vaginal tamponade with gauze soaked in liquid petrolatum will control severe hemorrhages. 12. For the ileus of the late stages of the disease a low residue diet, liquid petrolatum and enemas are indicated.

Acute Appendicitis in Children.—Deaver presents a study of 417 consecutive cases of acute (perforated, nonperforated and perforated with abscess or with peritonitis) appendicitis in children up to 14 years of age who were admitted between 1930 and August 1941 to the Children's Hospital of the Mary J. Drexel Home. Analysis of the data reveals that there was a steady decrease in mortality (11 of the 119 children with a perforated appendix died) during the period of the study. There were no deaths among the 298 children whose appendix was not perforated. The decreased mortality is attributed to proper preoperative care, increased use of the McBurney incision and intelligent postoperative care, which stressed proper fluid electrolyte administration and duodenal suction. Sulfanilamide has been used for the last two years; 1 to 2 Gm. was placed in the peritoneal cavity and 1 to 2 Gm. in the wound. The dose depended on the amount of contamination, the size of the incision and the size and age of the child. When drainage was employed, sulfanilamide was administered by hypodermoclysis for the first three days. The drug has not been harmful. Its intraperitoneal use may be beneficial for early peritonitis. Its use in the wound has cut down minor complications of the wound when drainage was not used and permitted incisions to be closed more tightly when drains were used.

Androgen Therapy.—Dunn reviews the use of androgen therapy for the young hypogonadal male, the climacteric male and the impotent male. The most effective and practical method of administering testosterone for genital hypoplasia is by implantation in the adult male and by oral or hypodermic administration for the puberal or the adolescent male. Patients given an adequate amount of testosterone exhibit definite

primary and secondary sex characteristics and favorable constitutional effects. Testosterone stimulates and sometimes accelerates growth. The least favorable results are obtained when impotence develops after diabetes or testicular atrophy. It is possible to induce testicular development when 200 to 300 mg of testosterone is implanted at intervals of four to six months. The administration of testosterone to patients with diabetes resulted in a diminished requirement of insulin.

Alzheimer's Disease—English presents evidence that supports his belief that Alzheimer's disease is more prevalent than is generally believed. The necropsy statistics at the Rochester State Hospital show about a 15 per cent incidence. Since 1935, 7 typical cases have come to necropsy. In another case a clinical diagnosis was made but permission for necropsy was not obtained. At the Rochester State Hospital at present there are 4 patients with the diagnosis of Alzheimer's disease. Inquiry into its incidence in other New York state hospitals for 1935 to 1939 inclusive revealed that Alzheimer's disease was diagnosed in 29 patients on their first admission to a state hospital. Of the 29 patients, 19 have died, necropsy of 11 was permitted in 7 of whom the diagnosis has been confirmed. It appears that in roughly one third of the cases the diagnosis is erroneous, but when it is considered that in a certain number of cases the disease is not diagnosed the erroneous diagnoses tend to be compensated for.

Early Degenerative Lesions of Pancreas—Wallace and Ashworth state that a careful review of sections of the pancreas from 200 recent necropsies revealed many unsuspected lesions. Adipose tissue invasion, fibrosis, arteriosclerosis and arteriolar sclerosis were observed to increase in frequency with advancing age. The evidence suggests that arteriosclerotic atrophy is probably the most frequent cause of the first two unsuspected lesions. Dilatation of acini and ducts is frequently present but has no definite relation to age.

Postpartum Psychoses—Day does not believe that the psychosis that develops during or soon after pregnancy is different from the psychosis that would develop in the person affected under any other circumstances. The psychosis developing during the pregnancy-puerperium period should receive the prompt and scientific diagnosis and treatment that the same psychosis would receive at other times. Every community ought to have a psychiatrist within consultation distance and every general hospital a psychiatric department equipped for the scientific treatment of acute psychosis.

Effect of Vitamins B and C on Senile Patients.—Stephenson and his colleagues studied the effect of vitamins B and C on 15 old men and 25 old women. The study was carried on for a year and was controlled by giving 18 similar subjects dummy pellets of laetic sugar. The observation time was divided into five periods of eight or nine weeks, during which examinations and tests were performed repeatedly. The treatment periods were alternated with rest periods of ten to fourteen days. The post-treatment period lasted four to five months. The ages of the treated and control patients varied from 60 to 87. All the patients had some degree of senile dementia accompanied by the usual features of senility and/or those of aging. All were given a usual hospital diet not rich in vitamins. Treatment with the vitamins did not stop the biologically inevitable development of senility and did not affect the basic features of senility already present. However, the treatment prevented or improved, in some cases to a striking degree, certain senile features which could be considered pathologic, which appeared prematurely or in an extreme degree (e. g. muscular, cardiovascular and mental deterioration) or which do not seem to be inevitable in normal physiologic senility (e. g. dementia, insomnia, cutaneous rashes, itching and constipation). During the study improvement or disappearance (apparently not lasting) of some pathologic senile features was often observed, while a number of persons were not improved and in a few certain senile features developed during treatment. The results emphasize that the greatest care should be taken to prevent partial or latent vitamin deficiency, which not only may prevent certain vitamin deficiency diseases but may lengthen the approach to pathologic senility. About four

months after the treatment was terminated considerable deterioration occurred; the improvement obtained during treatment disappeared and some new instances of deterioration appeared. In spite of the relapse in some persons, in others the improvement was maintained after therapy had been withdrawn.

Blood Transfusion for Malignant Diphtheria.—Pugh and Williams gave 20 consecutive patients with malignant diphtheria transfusions of 500 cc. of stored citrated blood. There were 2 deaths among the 20 given blood transfusion and 7 deaths among 20 similar control patients. Of the 2 patients who died in the test series, 1 was moribund on admission and died a few hours after transfusion and the other died during the sixth week from cardiac failure. In the control series 5 patients died of profound toxemia during the first week of illness and 2 from cardiac failure during the second week. Immediately after the transfusion of blood the apathetic and drowsy patient had a bright and keen appearance, and the nasal discharge, the peritonsillitis and the membrane cleared rapidly. Fourteen of the 18 patients in the test series had thirty-three complications, as compared to forty-four complications for the 13 control patients. Severe complications (cardiac irregularities, pharyngeal paralysis and peripheral neuritis) were more prominent among the latter. The average hospitalization time for the treated was ten weeks as against thirteen weeks for the control patients. The results appear to warrant further investigation.

Hyperthyrotic Catatonia.—Hemphill tried to determine the incidence of hyperthyroidism and its distribution among 2,096 male and 2,654 female patients with recognizable types of mental illness. There were 5 men and 54 women with goiter. Apart from toxic delirium, mania, depression and paranoid paraphrenia, hyperthyroidism was not a significant factor in the production of mental disease. There was no typical postoperative reaction. Simple or nontoxic goiter did not occur in any case of early schizophrenia. Hyperthyroidism in schizophrenia was infrequent and was associated with only a particular form of reaction: hyperthyroid catatonia. The clinical features of this disorder consist of varying schizophrenic symptoms with auditory hallucinations, an acute episode with visual hallucinations, distortion of the body image, inability to differentiate parts of the body and other evidences of instability of the boundaries of the ego. This phase is succeeded by catatonic stupor. In cases of severe hyperthyrotic catatonia the end result is dementia. Systematic determination of the anterior pituitary hormones may provide the key to the schizophrenic illnesses.

Hypophysis and Lactation.—According to Berblinger the relation between prolactin, the lactogenic hormone of the anterior lobe of the hypophysis, and the other hormones of the anterior lobe of the hypophysis has not been clarified. It is possible that this relation is quantitative and that it depends on changes in the numerical ratio of the epithelial cells of the anterior pituitary. It has been established that the acidophilic epithelial cells produce the growth hormone and the basophilic cells the gonadotropic hormones. According to Bates and Schooley the acidophilic epithelial cells are also the source of prolactin, at least in animals. The author thinks that the main cells of the adenohypophysis and the pregnancy cells originating from them must have a special function and suggests that it is possible that the pregnancy cells are the source of prolactin. He is of the opinion that information about the site of prolactin formation can be obtained only in cases in which lactation has developed in the absence of pregnancy and birth and in the presence of certain hypophysial changes. Such cases are rare. The author cites the history of a woman aged 47 in whom lactation began in the absence of pregnancy, abortion or childbirth but in the presence of a hypophysial adenoma which consisted mainly of epithelial cells corresponding to pregnancy cells. The author likewise cites the occurrence of mammary secretion in female and male patients with acromegaly and of lactation in the presence of bilateral ovarian tumors and directs attention to hypophysial changes in some patients with malignant growths. A woman had been operated on for sarcoma and for extensive sarcomatous metastasis. It is suggested that the adenoma formation in the anterior pituitary had some connection with the tumor formation. If prolactin formation takes place in the hypertrophic main cells and in the pregnancy cells, the abnormal lactation can be explained, as well as the time of its onset (shortly before menstruation, when the corpus luteum was in regression; at this time the excess of prolactin can exert its effect). In rats with experimentally produced hypophysial tumors the mammary glands are found in the secretory phase when the tumors contain foci which resemble pregnancy cells. It is highly probable that the pregnancy cells are the site of production of prolactin.

Radiotherapy of Cervical Cancer.—Brouha points out that radium and roentgen therapy have largely replaced the radical surgical treatment of cervical cancer. He reports results obtained by irradiation in the cancer hospital of Liège. The treatment is decided on after a consultation between the radiologist and the clinician. Generally the patient with a cervical neoplasm is treated first by radium and later by transcuteaneous high voltage roentgen irradiation. Of 602 patients treated between 1925 and 1935, 171, or 28.25 per cent, survived more than five years. Of those in whom the lesion was in the first stage 51.3 per cent survived; of those with a lesion in the second stage 34.7 per cent and of those with a lesion in the third stage 14 per cent. This difference in the mortality according to the severity of the lesion is especially pronounced during the first year after the treatment. During the subsequent years the mortality is practically the same for all patients. When the patient has survived beyond the first year without a relapse, the prognosis is no longer influenced by the grade of the initial lesion. The five year survival rate of 28.25 per cent for the total number of cases may be classed with the better statistics. Unfortunately it seems stabilized, as is also the less satisfactory survival rate of 51.3 per cent for patients in whom the lesion was of the first grade. Radiotherapy is the treatment of choice for cancer which has extended beyond the cervix. In certain cases, particularly in those in which surgical intervention is no longer possible, the effects of irradiation sometimes border on the miraculous. Extensive lesions become cicatrized, pain ceases and the general condition improves. A small number of patients are cured, while others are able to lead an almost normal life for variable periods. Further progress must be hoped for from increasingly earlier diagnoses and from a sane rivalry between irradiation and surgical intervention. The former must become more penetrating and more selective; the risks of the latter must be reduced.

Determination of Prothrombin Time with Human Milk.—Freudenberg describes a method which had been outlined by Hauser in 1940. It follows the micromethod developed by Fiechter and by Kato on the basis of Quick's technic. Its only originality is in the fact that human milk is used instead of brain extracts as a source of thrombokinase. Since the measurement of the prothrombin, according to Quick's technic, presupposes constancy of the calcium content, the human milk must be decalcified. This is accomplished by the addition of sodium fluoride. The peroxidase of human milk, being destructive of thrombokinase, must also be removed. This is done by adding pyrrole, the peroxidase toxin. To 20 cc. of freshly obtained breast milk are added 14.7 mg. of sodium fluoride and 0.3 cc. of pyrrole. The milk is stored in the ice box but should not be frozen. The prothrombin time is determined according to the aforementioned micromethods with 0.1 cc. of oxalated blood, 0.1 cc. of human milk (prepared as stated) and 0.1 cc. of calcium chloride solution. The advantage of the use of milk over the use of brain extracts becomes evident when it is considered that the difficulty of keeping brain extract available has been one of the chief obstacles to the regular employment of the valuable determination of the prothrombin time.

Combined Immunization.—According to Ramon the method of combined vaccinations has been practiced for fifteen years. It consists in the simultaneous development of two or several immunities by means of a mixture of different vaccines. This method rests on the principle of "substances that aid and stimulate immunity." According to it vegetable or mineral substances, such as tapioca, tannin, calcium chloride, alum and

aluminum hydroxide, when added to an antigen, are capable of increasing the specific immunity which that antigen can induce. When these substances were first introduced it appeared hardly possible to use some of them in human subjects, although they had produced good results in animals. It was for this reason that the antityphoparatyphoid vaccine was tried; this vaccine was to assume the role of tapioca. Thus the combined vaccines were realized. The practical application of combined vaccination has furnished numerous and irrefutable proofs that multivalent immunization can be effected by a mixture of several vaccines.

Combined Vaccination Against Smallpox and Diphtheria.—Combined administration of antivariola and antidiphtheria vaccines, according to Reh, has been made obligatory in Italy. The method has incontestable advantages over the individual administration of the two vaccines. Only two vaccinations are necessary for immunization against both smallpox and diphtheria. This constitutes a considerable simplification. The technic employed is as follows: at the first session vaccinal lymph is introduced into the arm (in boys) or leg (in girls), and this is followed by the injection of 1 cc. of diphtheria toxoid into the opposite suprascapular region. Three weeks later the antivariola vaccination is controlled and at the same time a second injection of diphtheria toxoid (2 cc.) is given. After another three weeks the antidiphtheritic immunity is controlled by skin reaction. Complications did not develop in any of the 19 children vaccinated during the double vaccination. The antidiphtheria immunizing power was tested on 14 of the 19 children and proved 100 per cent successful. The antivariola immunity resulting from combined vaccination was tested on rabbits by Sobernheim's method. It was found that the group of animals vaccinated against diphtheria reacted to the solutions of lymph slightly more than the nonvaccinated rabbits. The author regards the combined vaccination against smallpox and diphtheria as a distinct advancement.

Culture of Ultravirus.—Hauduroy points out that for a long time it was accepted that ultravirus cannot be cultured, its growth having failed in numerous mediums. This failure of growth was due to disregard of an essential law of the physiology of ultravirus. Rabic, poliomyelitic and vaccinal virus will not grow in gelose, bouillon or synthetic mediums, no matter how rich. Ultravirus develops only in the presence of living matter; it is biotropic and possesses an essential, exclusive and imperative affinity for living matter. Without such matter it can neither survive nor develop. Vaccinal virus may be developed by inoculation of a heifer's flank and rabic virus by inoculation of the medulla of a rabbit. The author reviews attempts to culture ultravirus in symbiosis with tissue cultures. The characteristic designated as biotropism is so imperative that it dominates not only the technic of culture but all the affinities of ultravirus. The living cell is necessary for their development, and the more intense the life processes of the cell, the more intense is the development of the virus. It has greatest affinity for cells undergoing multiplication. The culture of ultravirus is now possible.

Immunity After Scarlet Fever.—Freudenberg investigated the frequency of secondary attacks of scarlet fever in the same person, the negativity of the Dick test after scarlet fever and the blanching phenomenon of the serum at the end of the disease. He defines as a secondary attack one occurring after an interval of more than three months. The establishment of this interval is important because relapses may occur during the primary attack. He cites reports on the incidence of secondary attacks of scarlet fever and states that in his own material of 1,200 cases there were 19 such attacks. The interval between the first and second attack varied from five months to seven years. Mostly children less than 6 years of age had a second attack. The Dick test was made on 303 convalescent patients with scarlet fever at the end of the sixth week, and 47 per cent were found to be positive. Classification of these patients according to age levels disclosed that positivity predominates among the young children and that only in children over 10 years of age does negativity reach 75 per cent. The blood serum of the majority of those with a positive Dick reaction did not produce the Schultze-Charlton (blanching) phenomenon, whereas the serum of the majority of those with a negative Dick reaction

(6 of 10) did produce the blanching phenomenon. The serum of none of the children less than 6 years of age manifested the blanching phenomenon at the end of the sixth week of the attack of scarlet fever. The author concludes that in children of less than 10 years of age it is unjustified to regard scarlet fever immunity as certain six weeks after the attack. He believes that this immunity is generally overestimated.

*Malarial Inoculation Through Sternal Bone Marrow. N. Quattrin.—p. 229.

Malarial Inoculation Through Sternal Bone Marrow.—Quattrin withdrew blood from patients artificially infected with tertian malarial parasites in the course of the fifth or sixth febrile attack and injected from 3 to 8 cc. of this blood into the sternal bone marrow in 9 cases. Samples of sternal blood were withdrawn at intervals during the first three hours after inoculation. The malarial parasitic forms disappeared rapidly from the sternal bone marrow in all cases but 3, in which scanty normal intraerythrocytic forms were found in the marrow within seventy minutes after inoculation. The reticuloendothelial cells and the protoplasm of the myeloid cells did not contain parasitic forms in any case. Malaria developed in 6 cases after an average incubation period of nine days. The prolonged incubation period in 6 cases and the lack of development of malaria in 3 cases were not related to the amount of blood injected, the number of parasites in the blood and the phase of cyclic evolution of the parasite. The author believes that the bone marrow has a particular effect on malarial parasites which prolongs the incubation period beyond that requisite after intravenous inoculation.

*Artificial Pneumothorax in Pulmonary Tuberculosis Complicating Asthma. R. F. Vaccarezza and R. Cucchiani Acevedo.—p. 67.

Artificial Pneumothorax in Pulmonary Tuberculosis and Asthma.—Vaccarezza and Cucchiani Acevedo made manometric determinations of intrapleural pressure and roentgen studies of the lung before, in the course of and after acute attacks of asthma in cases in which unilateral or bilateral artificial pneumothorax had been induced. Three cases are reported. In 2 cases of unilateral slightly hypertensive pneumothorax the manometric figures showed acute increase of intrapleural pressure during the attack. Administration of bronchial antispasmodic drugs failed to control the attack, which could be permanently controlled by removal of intrapleural air by pleural puncture. In the third case the pneumothorax was bilateral. It was slightly hypertensive in one lung and hypotensive in the other. The intrapleural pressure was not measured during the attack, but roentgen examination showed reexpansion of the lungs and opening up of the cavities. The acute attacks of asthma were controlled by administration of epinephrine. Immediately after control of the asthmatic attack roentgen examination of the lung was again performed. It revealed a greater collapse of the lung and diminution in the size of the cavity. Immediate discontinuance of pneumothorax resulted in a complete control of the asthmatic attacks. The author believes that bronchial expiratory obstruction which occurs in the course of acute attacks of asthma is the cause of acute expansion of the lung and increase in the intrapleural pressure. In asthmatic tuberculous patients the cavities offer great resistance to closure by pneumothorax. This makes it necessary to reach a pressure equivalent to or slightly higher than the atmospheric pressure.

*Intrapleural Pneumolysis in Prevention of Tuberculous Bilateralization. R. Pardellas and J. Carvalho Ferreira.—p. 733.

Intrapleural Pneumolysis in Prevention of Tuberculous Bilateralization.—Pardellas and Carvalho Ferreira subjected to pleuroscopy a large group of patients with unilateral artificial pneumothorax for pulmonary tuberculosis. Those found to have adhesions were placed in one of two

groups. Patients in one group were treated by pneumonolysis after the second or third insufflation of air. Those in the second group were not thus treated. The improvement in the general condition of patients subjected to pneumonolysis was more evident than improvement in the group which did not have pneumonolysis. Immediate or late recurrence and bilateralization did not occur in patients of the first group, whereas it did occur in several patients of the second group. The authors emphasize the importance of pleurolysis as a routine when adhesions develop after unilateral pneumothorax. The facts that the condition of the patient is apparently good after the establishment of pneumothorax, that the adhesions are not visible on roentgen examination and that the sputum has become negative for tubercle bacilli are no argument against the performance of pneumonolysis. The authors observed in their municipal tuberculosis department that a large number of patients had bilateral pneumothorax during 1938, 1939 and 1940. The performance of pneumonolysis as a routine was established and has been practiced in the department since 1940. Early pneumonolysis stimulates defense reaction of the body and a specific reaction of the normal lung through which the resistance of the organ increases.

*Vitamin C: Effects on Diuresis. R. João Marques and R. Ribeiro.—p. 119.

Dialectrolytic Administration of Vitamin B₁ in Neuropathic and Myopathic Syndromes. S. Brown.—p. 131.

Effect of Vitamin C on Diuresis.—João Marques and Ribeiro administered vitamin C to patients with moderate insufficiency of the liver and to patients with atrophic cirrhosis, edema and ascites. Acute oliguria, which was present in all cases, was controlled by administration of vitamin C. The preparation used contained natural and synthetic vitamin C in equal amounts. It was administered for a week by intramuscular injection in daily doses of 5,000 units. Some patients were given a second week of treatment with daily doses of 2,000 units. In all cases the elimination of urine was greatly increased. The patients were discharged without edema and ascites and with normal elimination of urine. Four cases are reported. The author believes that vitamin C improves hepatic function with consequent improvement in the water metabolism and in the functions of the capillaries and of the kidneys.

*Therapy of Cretinism. L. DéCourt.—p. 125.

Therapy of Cretinism.—DéCourt states that the main factors in the successful therapy of cretinism are early diagnosis and adequate thyroid therapy. The daily dose varies from 0.0065 to 0.048 Gm. of thyroid for infants, from 0.032 to 0.097 Gm. for children aged 2 to 4 years and from 0.065 to 0.191 Gm. for children from 4 to 12 years of age. The treatment should be administered without interruption all through the life of the patient.

*Experience with New Method (Massive Arsenotherapy by Intravenous Drip) in Treatment of Syphilis. J. Bryan.—p. 2350.

Erythema Infectiosum, or Fifth Disease. D. P. R. Keizer.—p. 2368.

New Method in Treatment of Syphilis.—Bryan calls attention to the intravenous drip method of massive arsenotherapy first employed by Hyman of New York and Tzanck of Paris. In the last two and a half years Bryan used this method in 32 cases. He administered daily by intravenous drip 1.5 Gm. of neoarsphenamine diluted in 300 cc. of physiologic solution of sodium chloride. The procedure is repeated three days in succession until a total of 4.5 Gm. of neoarsphenamine has been given. The short duration is the chief advantage of this method, because it enables the patient to regard treatment as a sort of operation instead of being obliged to return regularly for injections over long periods. The method involves certain dangers. In 4 patients (12.5 per cent)

the renal function became seriously impaired, but the disorder cleared up in a short time and no permanent injury of the kidney resulted. In 3 patients (11 per cent) mild peripheral neuritis developed. The author, unlike other observers, encountered no instances of cutaneous disease following massive arsenotherapy. Although more time will have to elapse before final evaluation is possible, the author is favorably impressed with the method and suggests that in a modified form it might become the method of choice for the treatment of early syphilis.

*Significance of Pregnancy Reactions According to Aschheim-Zondek and Friedman in Diagnosis of Hydatid Mole and Chorioepithelioma. R. E. J. Ten Seldam.—p. 2378.

Malignant Tumors of Intestine. S. Tjokronegoro.—p. 2394.

Further Experiences with Aspiration Punctures in Histologic Diagnosis of Tumors. H. Müller.—p. 2421.

Roentgen Treatment of Cutaneous Carcinomas. G. J. Staverman.—p. 2434.

Roentgen Diagnosis of Malignant Pulmonary Tumors. W. Z. Johannes.—p. 2442.

Histologic Peculiarities of Carcinoma of Tongue. G. Bras.—p. 2465.

Pregnancy Reactions in Diagnosis of Hydatid Mole and Chorioepithelioma.—Ten Seldam reports his experiences with Aschheim-Zondek and Friedman reactions during five years, in which eight hundred tests were made. Of this number one hundred and sixty-two were made because of suspected mole, of suspected malignant degeneration of a mole, as control after birth of a mole or after uterine extirpation for chorioepithelioma. These one hundred and sixty-two tests were made on 109 patients, of whom 58 had molar pregnancy, 8 had chorioepithelioma and 43 had neither. The author concludes that the tests for gonadotropic substance in the urine of women represent a distinct diagnostic gain. However, too great importance should not be attached to a high level of the substance during the first months of pregnancy for the diagnosis of hydatid mole. Lower values than are customary for hydatid mole do not constitute an absolute sign against this diagnosis. Of greatest importance is the quantitative reaction as control following the birth of a mole. If the reaction remains strongly positive for a long time or if it increases in severity after an initial reduction or a negative phase, it is strongly suggestive of chorioepithelioma, if a new pregnancy can be excluded. The test must be repeated at regular intervals until it becomes negative, and even after that it must be repeated at least once. The time necessary to produce a negative reaction is of less importance than the regular decrease in the intensity of the reaction. The reaction should be negative one month after the total extirpation. Absence of a negative reaction indicates metastasis. It is possible that at one time not enough chorionic tissue is present to make the reaction positive, but still enough for the development of chorioepithelioma. It is desirable to make the test also with spinal fluid in cases in which molar pregnancy or chorioepithelioma is suspected.

*Treatment of Pneumonias in Childhood with One Single Large Dose of Sulfathiazole (Shock Dose), Illustrated by Seventy Cases. C. Friderichsen and P. Søbye.—p. 1331.

Sulfathiazole Rapid Treatment of Gonorrhea. P. Bonnevie.—p. 1342.

Pellagra: Case. M. Jversen.—p. 1343.

Deep Pressure Necrosis Caused by Ordinary Rubber Band: Case. J. V. Nielsen.—p. 1345.

Treatment of Pneumonia in Childhood with Single Large Dose of Sulfathiazole.—Friderichsen and Søbye state that in the treatment of pneumonia in children sulfathiazole is an exceedingly valuable agent, superior to sulfapyridine because of its rapid elimination and the few side effects. Of 129 children with pneumonia treated with sulfathiazole, 70 were given a single shock dose and 59 were treated with multiple doses for four days. The simpler administration of the large dose is as effective as the treatment with multiple doses, causes fewer secondary toxic effects and costs half as much as the continuous treatment. The shock dose of sulfathiazole given children weighing up to 13 Kg. was 0.3 Gm. per kilogram of body weight, while children weighing 20 Kg. received 0.2 Gm. and those weighing 30 Kg. received 0.14 Gm. per kilogram of body weight; the maximal dose was 4 to 5 Gm.

Book Notices

The Retina: The Anatomy and the Histology of the Retina in Man, Ape and Monkey, including the Consideration of Visual Functions, the History of Physiological Optics and the Histological Laboratory Technique. By S. L. Polyak, M.D. A Fiftieth Anniversary Publication of the University of Chicago Press. Cloth. Price, \$10. Pp. 607, with 100 illustrations. Chicago: University of Chicago Press, 1941.

The object set by the author in his book is "the elucidation of the complex structure of the retina: the identification of the types or varieties of neurons which compose it, and the understanding of their synaptical relationships . . . the modes of integration of the various nerve cells into a composite texture." Beginning nine years ago with examination of the monkey's retina by analytic methods, the author was led into a most extensive study of the retina of other animals, including man. Although his own investigation was undertaken from the point of view of neuroanatomy, any one who expects a dry and technical exposé of isolated histologic findings is due for a pleasant surprise in this book, for the author has included a history of conceptions of the visual processes through the ages and has arrived at some exceedingly stimulating ideas as to the relations of the various functions of the eye to the complex structures revealed by him and by other students in this field.

A technical section describes the various methods employed in study of the retina and the part played by each in the analysis of the retinal neurons. Since a study of the synapses occurring in the retina was of primary importance, stress is placed on the value of the supravital staining method of Ehrlich and the silver and gold impregnation method of Golgi with its modifications by Ramón y Cajal.

For his historical section the author has gone back to Greek and Latin sources and, with the aid of Max Meyerhof of Cairo, to the Arabic manuscripts. A number of diagrams of the visual apparatus, some not previously printed, are reproduced from these sources. The story of how our present knowledge of the visual apparatus has developed from the mass of misconceptions embodied in Greek and Arabic writings, of the bypaths and blind alleys on which early scholars were led to depart as a result of persistently erroneous authority and of how the results of technical progress, finally coming into the possession of a few men of genius such as Kepler, Müller and Ramón y Cajal culminated in our present conceptions of visual function, is a fascinating one. Briefly, the Greek ideas which placed the seat of vision in the crystalline lens were preserved and disseminated by Arab scholars and, after the darkness of the middle ages, were taken up by the first European writers, the link of continuity being the writings of the Moorish scholars in Spain. One of these Arabic scholars, Ibn Rushd, better known as Averroës, had in the twelfth century described, probably from an unknown Greek source, a conception of the image formed on the retina. It was not until 1583 that Platter of Basel offered a development of this idea, including the refraction of light rays by the dioptric media. He proved that the retina is the place where the visual image is formed. It remained for Kepler, however, in 1603 to calculate the effects of the refractive media and to provide exact formulas on which modern physiologic optics rests. Study of the retina was hampered by the belief that the photoreceptors must be on the vitreous surface, so it was not until 1853 that Müller proved the rods and cones to be the true photoreceptors. Study of the individual neurons in the retina first produced useful results in the hands of Ramón y Cajal and his pupils, but since his time little progress has been made until the work of the author.

His work, as shown by many finely reproduced illustrations in this book, included a careful study of the individual retinal neurons by analytic methods, with emphasis on the synaptic connections of the various units. The details of this work are too complex to be even touched on in a review. One comes out of it, however, with a conception of an integrated system of structures much more complex than would be obtained from presentations of the subject in textbooks of ophthalmology or anatomy. While more complex, it is also more complete and offers the possibility of explaining certain phenomena of vision

in ways which were previously impossible. Without abandoning his role as neuroanatomist, the author has had the courage and imagination to follow his microscopic observations to conclusions concerning the part which the retinal structure may be supposed to play in the complex processes of vision. One of these is color vision. The author finds no evidence for the existence of separate types of cones which might be receptive to light of certain wavelengths. He believes that each cone is capable of response to all colors and suggests that analysis of this reaction produced in the cones may be carried out through the connections of each cone with bipolar cells of different type. There are actually reasons for believing that the midget bipolar cells may be especially sensitive to the reaction induced in a cone by light of long wavelength.

The monosynaptic midget bipolar cells and the midget ganglion cells are seen to have a one to one connection with the cones, especially with the specialized thin cones found in the foveal region. These connections form a "pure, or private, cone system" which seems to represent "the instrument for the most delicate spatial analysis or discrimination of the visual stimuli." By connections with other polysynaptic or diffuse bipolar cells, however, and through them with several ganglion cells of various types, impressions from larger or smaller areas of the retina may reach the central nervous system. By synapses of various types "gateways" of varying permeability are formed, by which it is conceivable that weaker stimuli, for example, may reach only certain types of bipolars and produce a specific response in them only when a number of photoreceptors are stimulated, hence mediating coarser impressions of larger objects. The system of intraretinal association neurons represented by the horizontal and possibly some of the amacrine cells may function in some way so as to lower or increase the threshold of the photoreceptors.

These are only a few of the ideas which are to be found in Dr. Polyak's book. Further studies have led him to a consideration of the higher visual pathways. These are briefly summarized in this book and will form the subject of another volume. In format and in reproduction of illustrations the book is up to the highest standards.

Science and Sanity. An Introduction to Non-Aristotelian Systems and General Semantics. By Alfred Korzybski, Director Institute of General Semantics, Chicago. With supplementary introduction and bibliography. The International Non-Aristotelian Library Publishing Company. Second edition. Paper. Price, \$6. Pp. 798, with illustrations. Lancaster, Pennsylvania & New York: Science Press Printing Company, Distributors, 1941.

Language in Action. By S. I. Hayakawa, Assistant Professor of English, Illinois Institute of Technology, Chicago. Cloth. Price, \$2. Pp. 245. New York: Harcourt, Brace & Company, 1941.

Language Habits in Human Affairs: An Introduction to General Semantics. By Irving J. Lee, Ph.D. With a foreword by Alfred Korzybski. Cloth. Price, \$1.75. Pp. 278, with illustrations. New York & London: Harper & Brothers, 1941.

1. This volume, from the Institute of General Semantics, is obviously the basis of many of the current writings in semantics which have attracted such large public audiences. The average reader would do well to consult such works as those of Stuart Chase on "The Tyranny of Words" and Hayakawa on "Language in Action" as an introduction to this more profound contribution. As Stuart Chase has said, "Korzybski has spent ten years on the book, raiding nearly every branch of science, from neurology to the quantum theory, in a stubborn attempt to find how words behave, and why meaning is so often frustrated." The author, who is both a mathematician and an engineer, has endeavored to synthesize human knowledge in various sciences with a view to making all knowledge more understandable. The author finds in his study of semantics an approach to psychosemantic disorders.

2. It might seem strange to have a book on the proper use of English written by a Japanese, but this book has the special value of simplicity in its approach to the subject, giving to words a significance such as they do not have until one is fully informed of their meanings.

3. In these times, when the deliberate misuse of language is an art and when people need more and more to be able to comprehend everything that is said, such books as these are veritable

guide books to human understanding. The book by Lee contains some excellent line drawings, and each of the chapters is supplemented with hints for further study on the use of language in human affairs.

Help Your Doctor to Help You When You Have Food Allergy. Dr. Walter C. Alvarez, Editor-in-Chief. Cloth. Price, 95 cents. Pp. 50. New York & London: Harper & Brothers, 1941.

Help Your Doctor to Help You When You Have Sick Headache or Migraine. Dr. Walter C. Alvarez, Editor-in-Chief. Cloth. Price, 95 cents. Pp. 37. New York & London: Harper & Brothers, 1941.

Help Your Doctor to Help You When You Have Colitis. Dr. Walter C. Alvarez, Editor-in-Chief. Cloth. Price, 95 cents. Pp. 30. New York & London: Harper & Brothers, 1941.

Help Your Doctor to Help You When You Have Gastric or Duodenal Ulcer. Dr. Walter C. Alvarez, Editor-in-Chief. Cloth. Price, 95 cents. Pp. 53, with 3 illustrations. New York & London: Harper & Brothers, 1941.

Help Your Doctor to Help You When You Have Gallstones and Disease of the Gallbladder. Dr. Walter C. Alvarez, Editor-in-Chief. Cloth. Price, 95 cents. Pp. 41, with 5 illustrations. New York & London: Harper & Brothers, 1941.

These books are the first of a series written to supply answers to the questions which enter the minds of sick persons concerning their ailments. A patient with accurate and up-to-date information concerning his disorder should cooperate more intelligently with the physician. The material presented in the books is scientifically accurate, as it must be when prepared by authorities of such ability in their various fields of medical practice. The presentation is clear and simple enough to permit of complete understanding by the average person.

Essentials of Prescription Writing. By Cary Eggleston, M.D., Associate Professor of Clinical Medicine, Cornell University Medical College, New York. Seventh edition. Cloth. Price, \$1.50. Pp. 133. Philadelphia & London: W. B. Saunders Company, 1942.

One of the severest critics of any publication is time. That "Essentials of Prescription Writing" is in its seventh edition is an excellent indication of the usefulness of this little book. It began as an accumulation of a series of notes which were published in book form in 1913. As the author points out, the nature of the book precludes radical changes in this edition; nevertheless, revisions are evident. For those not familiar with the book, its purpose is best described by the author's brief statement "This small volume is intended to provide the student of medicine with a succinct yet sufficient treatment of the subject of 'prescription writing.'" It does just that. There are eleven chapters: introduction, Latin grammar, grammatical construction of prescriptions, weights and measures, the practical writing of prescriptions, doses of drugs, vehicles, incompatibility, modes of administration of medical agents, suggestions for prescribing official preparations and practice prescriptions. As in previous editions, these chapters are presented in a flowing but concise style with a minimum of verbiage. This is a handy pocket size book that is an addition to the library of any medical student, physician or pharmacist or, for that matter, to the library of any one who is actively interested in prescribing, compounding or promulgating drugs. It is gratifying to note the acknowledgment given to Dr. Robert Hatcher for "inspiration and encouragement." Dr. Hatcher has provided this for many of our present critical investigators.

Prevention of Malocclusion. By Paul Guy Spencer, D.D.S. Cloth. Price, \$5. Pp. 234, with 217 illustrations. St. Louis: C. V. Mosby Company, 1941.

By the statements of the preface, this is intended as a textbook for dental students and as a guide for practitioners. A glance at the table of contents shows that twelve of the eighteen chapters are related to treatment rather than to prevention. Diet, internal secretion and inheritance are covered in nine pages. Many years ago Dr. E. H. Angle and other investigators pointed out that many, if not most, malocclusions have their beginning in simple conditions from which most complicated ones may develop. Attention to these conditions at the beginning may result in normal development. This is the fundamental thesis of value in the book, but it is not as clearly or as well developed as it was forty or fifty years ago. The book contains many excellent observations. With a great many of

the views expressed, however, the reviewer finds himself in violent disagreement. The title is ill chosen, for the work is rather a superficial manual on the treatment of malocclusion than a textbook on prevention. It seems intended to encourage the general practitioner and the student to attempt orthodontic management without adequate knowledge and training. Although the text contains much fine material, it is not well organized and does not display clear thinking. The illustrations, especially the pictures of dental models, are poor, and in general the technic is antiquated and obsolete. It is not well adapted to use as a college textbook or to the needs of the general practitioner who aims to give his patient the best service. There is no justification for the attitude that only persons endowed with special gifts and training are capable of practicing a special field in their general practice, but they should not be encouraged to offer special service unless they are willing to acquire the knowledge and technic necessary for its execution.

Our Climate. Useful Information Regarding the Climate Between the Rocky Mountains and the Atlantic Coast, with Special Reference to Maryland and Delaware. Prepared by John R. Weeks. Issued by the Maryland State Weather Service. Edward B. Mathews, Director. In Cooperation with the United States Weather Bureau. Francis W. Belcher, Chief. Sixth edition, revised. Paper. Pp. 66, with illustrations. Baltimore, 1939.

Claiming that the climate of Maryland and Delaware is one of the best in the United States, this little book proceeds to paint a rosy picture of the natural advantages of this region. It is admitted that the summers are warm, but it is claimed that cool spells usually come to temper this warmth. No mention is made of the really depressive heat which prevails when these cool spells fail to come. The book has practically no bearing on health or disease, as the climate of Maryland and Delaware has no known health advantages that would recommend it to sick persons seeking a more healthful place of abode.

The 1941 Year Book of Public Health. Edited by J. C. Gelzer, M.D., Dr. P.H., Director of Public Health, City and County of San Francisco. Cloth. Price, \$3. Pp. 544, with 20 illustrations. Chicago: Year Book Publishers, Incorporated, 1941.

The second of the Year Book series on public health provides excellent and useful material for physicians and public health workers, whether they are administrators, field workers or epidemiologists. The most valuable articles selected from the leading professional journals both here and abroad have been carefully abstracted, and the editorial comments aid materially in evaluating the points of view expressed in many of the original papers. The practicing physician will find many articles abstracted which he may not have encountered in his usual readings. At present, when public health is in the forefront of the physician's mind, this book has particular importance.

Agua curativas y lugares de recreo de México. Por el Dr. Harry Petters. Paper. Pp. 130, with illustrations. Mexico, D. F.: Editorial Orbis, 1941.

Balneoterapia y crenoterapia: indicaciones y contraindicaciones. Por el Dr. Harry Petters. Paper. Pp. 50. Mexico, 1941.

These two publications make available general information concerning the various mineral resorts and so-called curative springs in Mexico. The publications include also the usual commercial announcements of some of these resorts and their products. Similar publications are available for other countries, but as far as we know nothing similar or even slightly comprehensive has been prepared for the United States. Perhaps the new Committee on American Health Resorts of the American Medical Association will be able to develop a publication of this kind with authoritative scientific statements.

Common Skin Diseases. By A. C. Roxburgh, M.A., M.D., B.Ch., Physician in charge of the Skin Department, St. Bartholomew's Hospital, London. Sixth edition. Cloth. Price, 16s. 1p. 436, with 177 illustrations. London: H. K. Lewis & Co., Ltd., 1941.

This continues the excellence of the previous editions. The author has endeavored to bring the book up to date by adding sections on thorium X dermatomyositis and has expanded the chapter on avitaminoses. The book is exceedingly well written and well balanced with a useful chapter presenting an index of preliminary diagnosis for students.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

THROMBOPHLEBITIS, PUERPERAL SEPSIS AND PULMONARY EMBOLISM

To the Editor:—What differentiation can be made between thrombophlebitis and puerperal sepsis when pulmonary embolism occurs as a postpartum complication? Can thrombophlebitis occur without bacterial invasion of the blood stream? Would four or more negative blood cultures and negative cultures of the vaginal secretions be considered sufficient evidence to rule out bacteremia? Would the use of heparin interfere with the localization and resolution of small pulmonary emboli in cases of thrombophlebitis with pulmonary embolism?

Stiles D. Ezell, M.D., Middletown, N. Y.

ANSWER.—Puerperal sepsis is a broad term under which are grouped all the infections of the reproductive tract which occur in the puerperal woman. Thrombophlebitis is one manifestation of this complication. The veins of the placental site may contain septic thrombi which may gradually extend to involve the pelvic veins. These thrombi provide emboli which may be transported to distant foci. Most often pulmonary emboli arise from thrombi in the uterine or ovarian veins. The episodes of chills and fever which characterize the septic course of thrombophlebitis are the result of showers of bacteria in the form of small emboli which invade the systemic circulation. Bacteremia is usually present in thrombophlebitis. However, there may be few organisms in the blood at any one time. Thus a negative blood culture or several such cultures do not rule out thrombophlebitis.

The proper technic of blood culture will increase the incidence of positive results. The blood should be drawn during a chill or at the height of the fever. Fifteen or 20 cc. should be placed in nutrient broth and incubated for a week. If a growth appears it should be subcultured aerobically and anaerobically.

Thrombi in veins can occur without bacteremia, as is exemplified by thrombi in the lower extremities. These are the result of blood stasis and trauma to veins.

There is little information available on the use of heparin in puerperal thrombophlebitis. If heparinization is commenced early it is possible that thrombosis and subsequent embolic phenomena can be prevented. Apparently little can be accomplished by heparin after pulmonary embolism has developed. Heparin therapy should not interfere with the normal resolution of pulmonary infarction.

TREATMENT AND MARRIAGE IN LATE CONGENITAL SYPHILIS

To the Editor:—In the course of a routine hospital examination in 1936 a youth was found to have a 4 plus Wassermann reaction. The report of findings was given to the mother, who readily admitted that the father had syphilis. She submitted to a blood test and was also found to have a 4 plus Wassermann reaction. For four years the youth was given intensive treatment with neoarsphenamine, bismuth compounds and iodides. A recent blood test was 2 plus. The patient is feeling well with no objective or subjective signs of syphilis. He is now of age and contemplates marriage. In view of the blood findings should he marry? What advice should be given him? Should intensive treatment still be persisted in and, if so, how much longer?

M.D., California.

ANSWER.—From the evidence given it is presumed, although not definitely proved, that the youth in question has late congenital syphilis. Under these circumstances seroresistance in spite of prolonged antisyphilitic treatment is not unusual. Before permission to marry is given his spinal fluid should be examined, since the question of further treatment and, if so, of what type depends entirely on the character of the spinal fluid.

If the spinal fluid is normal the patient, having received four years of chemotherapeutic treatment, has now been adequately treated. The aim of treatment in such a situation is the prevention of outspoken clinical manifestations of disease. With the amount of treatment so far given there is about an 80 to 90 per cent assurance of indefinitely continuing good health, regardless of the serologic outcome in the blood.

If, on the other hand, the spinal fluid is abnormal, treatment should almost certainly be continued, though what kind of treatment should be given and over what period of time cannot be stated without knowledge of the spinal fluid findings.

As to marriage there can be no objection to this under either set of circumstances, provided the fiancée knows that the patient

has congenital syphilis. There is no risk of infection to the wife from a husband with late congenital syphilis; and children, if any, will be normal if the mother is not infected.

The reason for insistence on informing the fiancée of the patient's condition lies entirely in the fact that possible subsequent progress or relapse, most likely in the form of interstitial keratitis or nerve deafness, cannot be absolutely guaranteed against. Should the fact of the husband's infection, even though congenital, be accidentally discovered by the wife after marriage rather than honestly discussed before, there is some risk of marital discord.

Neither in patients with congenital nor in those with acquired syphilis does permission to marry (which depends almost entirely on potential infectiousness and on no other factor) have anything to do with the blood test.

The issues raised regarding the treatment of late congenital syphilis and regarding the marriage of syphilitic patients are much more fully discussed in Moore's *Modern Treatment of Syphilis*, second edition, Springfield, Ill., Charles C. Thomas, 1941.

"SHIN SPLINTS"

To the Editor:—I should appreciate information on a condition known as "shin splints." After many years of physical inactivity due to a fracture of the semilunar cartilage sustained while playing college football I have recently been attending a Y. M. C. A. regularly in an attempt to get back in shape. I weigh 230 pounds (104 Kg.), about 40 pounds (18 Kg.) overweight. I have been playing "paddle ball," which is similar to four wall handball, possibly foster. I frequently have pain over the lower half of the tibia while playing, starting mildly but getting more severe as I continue to play. This is associated with a tired aching feeling in the thighs extending up to the hip. This lasts for about twenty minutes after I stop playing, after which a dull ache persists for hours, and the tibia is sensitive to percussion. A former track star at the Y mentioned that the syndrome was common in athletes, being known as "shin splints." Could you give me any information on the entity?

Paul T. Perugini, M.D., New Rochelle, N. Y.

ANSWER.—The term shin splints is used by athletes, especially track men. The condition is probably due to myositis of the tibial and toe extensor muscles. It may be tendonitis, myositis or myofascitis with an element of periostitis. It is usually due to multiple minimal traumas, such as occur in tapping against hard surfaces, such as a track, a cement floor or a hard wood floor in a gymnasium. It may be due to repeated sudden starts and stops.

In nearly every athletic pursuit one leg is subject to more shocks than the other. Is the condition unilateral or bilateral?

A roentgenogram of the tibia would rule out periostitis or any other lesion, including a neoplasm. Reduction of the weight is advised.

While at the University of Chicago, in charge of the medical supervision of athletic teams, Molander saw many such injuries, and in the majority of instances they were in track athletes. They also occurred in football and basketball players.

The early diagnosis of the condition is sometimes difficult. In the great majority of instances the athlete states that he has a dull aching pain over the anterior surface of the middle and lower thirds of the tibia and fibula and that he finds it hard to raise the heel from the floor without experiencing a sharp pain over the area described. Shin splints occur as a rule early in the season and in the majority of cases are caused by running on a hard board surface which produces a constant jarring. The patients are slow in recovering.

The most noticeable symptom is severe tenderness over the anterior surface of the lower and middle thirds of the tibia and fibula. This area feels hard and tense. Support by means of circular taping seems to give relief. Molander attributed this condition either to a tearing of the origin of the dorsiflexors of the foot or to a severe tendon strain. The former explanation seems the more plausible because of the persistent aching pain, which becomes intensified while one stands on the toes, and because of the long recovery period.

In treatment Molander employed a circular adhesive strapping and additional long strips of tape from the knee and around the ankle, keeping it at a right angle. After twenty-four hours the involved extremity is placed in the whirlpool bath at 105 or 110 F. for at least half an hour. Then the part is dried with infra-red radiation; the ankle is kept at all times at a right angle. Drying is followed with massage of the entire extremity, the tender areas being avoided. When tenderness has disappeared a graduated system of therapeutic exercises is used, getting the patient to an upright position for athletic work when function of the foot has returned to normal. This may take weeks or even several months.

The " " is quoted from Thorndike, Augusten, *Diagnosis and Treatment*, 1938.

Shin splints in track, cross country and other sports are a definite injury—a tearing of the origin of the tibialis posticus muscle from the tibia in its lower third. This is caused by running on a hard surface early in the season and continuous, constant jarring and is slow in recovery. Heat and massage with three-quarter circular strapping (squeezing the gastrocnemius around the posterior surface of the tibia) gives relief as long as the strapping is maintained. Rest, of course, is the adjunct most needed, and this should be continued long enough to permit the torn muscle attachment to heal.

PROBABLE DIABETIC COMA

To the Editor—A white housewife aged 28 was seen at home in a severe coma. She was given 1 ampule each of caffeine and nikethamide and had regained consciousness on arrival at the hospital. The history was unreliable, but there was mention of diarrhea and vomiting for two to three days, the length of unconsciousness was unknown. There was no history of diabetes or drug addiction. The patient was able to answer questions, but the answers were so garbled that they defied interpretation. There was no odor on the breath. The pupils were widely dilated, and they dilated further in response to light. The chest was clear; the heart sounds were normal, the blood pressure was 110 systolic and 90 diastolic, the rectal temperature was 94 F. The abdominal and rectal examinations gave negative results. There were no neurologic abnormalities. A working diagnosis of shock due to some unknown toxin was made. Catheterized urine showed sugar 4 plus, albumin 4 plus and many red blood corpuscles, tests for acetone and diacetic acid gave negative results. Four hours after admission the temperature dropped to 93 F. A heat cradle was applied to the body. Examination of the eye-grounds gave negative results. The lumbar puncture showed normal pressure, clear fluid and no evidence of block, the Wassermann reaction of the spinal fluid was negative, the colloidal gold curve was 0000000000, the Pandy reaction was positive (1 plus); the fluid showed a trace of xanthochromia. The temperature reached 102 F., and the patient was still responding in incoherent speech. The white blood count at this time was 63,400, with 94 per cent polymorphonuclear leukocytes, 6 per cent lymphocytes and a shift to the left. The red blood count was 4,200,000 and the hemoglobin content 77 per cent. The blood sugar level was 490 and the nonprotein nitrogen 73 mg. per hundred cubic centimeters. The patient was given 500 cc. of whole blood, 2,000 cc. of Hartman's solution by hypodermoclysis and 150 units of regular insulin, plus heavy doses of the vitamins. She failed rapidly, however. Three catheterizations during the twenty-eight hour course had yielded 80 cc. of urine. At postmortem examination there were no positive findings. There was no evidence of fracture of the skull or injury to the brain. The heart and lungs were normal. The kidneys and liver showed no evidence of toxic damage. Can you suggest any toxin or drug which might have produced the clinical and laboratory effects mentioned and yet have shown no apparent trace of its virulence at autopsy?

Charles H. Pitegoff, M.D., New Haven, Conn.

ANSWER.—Positive diagnosis is not possible from the data available, but those furnished strongly suggest that diabetic coma was the cause of death. The patient was in coma with a low rectal temperature without signs of an organic cerebral lesion and showed glycosuria with evidence of failing renal function in the absence of postmortem evidence of renal disease. She showed albumin, a leukocyte count of 63,400 and a blood sugar content of 490 mg., with a nonprotein nitrogen level of 73 mg. per hundred cubic centimeters. It is regrettable that the blood plasma was not tested for acetone and its content of carbon dioxide determined. The absence of acetone and diacetic acid in the urine is most unusual in diabetic coma but has been known to occur in cases of renal block.

EFFECT OF TEMPERATURE OF INTRAVENOUS SOLUTION

To the Editor—Because of the reaction from intravenous injections of dextrose in saline solution it has been decided to give the solution at room temperature. I should like to know if this is satisfactory after anesthesia and also if it has the effect of lowering the body temperature. In the past the solution for intravenous use has been warmed to body temperature.

M D, California.

ANSWER.—Reactions in general and chills and fever in particular following the intravenous administration of dextrose in saline solution are due almost entirely to contamination of the solution or of the apparatus used for the administration. If concentrated (50 per cent) dextrose is administered intravenously rather rapidly, because of the high concentration a slight degree of vascular reaction may develop, but even this type of reaction occurs rarely. Although it is more physiologic to administer dextrose intravenously at body temperature, administration of the solution at room temperature should not make any essential difference as far as reactions are concerned. If the solution is administered slowly, the temperature of the room should not exert any appreciable influence in lowering the temperature of the patient's body.

LIFE EXPECTANCY AFTER SPLENECTOMY

To the Editor—I am anxious to obtain information concerning the following: 1. Does splenectomy alter life expectancy when (a) the spleen is removed for traumatic rupture or (b) the spleen is removed because of idiopathic thrombocytopenic purpura or familial (congenital) hemolytic icterus? 2. If a person has had splenectomy because of traumatic rupture of the spleen and is otherwise normal, will insurance companies sell him life insurance in exactly the same manner as if the spleen had not been removed? I have in mind the question of the relation of the spleen to resistance especially as concerns antibody formation. While it appears that most physicians feel that removal of the spleen is rapidly compensated for by hyperplasia of the other organs of the reticulo-endothelial system I am unable to find in the literature definite experimental or statistical proof of this. I am assuming that the patient has fully recovered from the trauma and the operation, so that operative risk is not a factor.

M D, Ohio

ANSWER.—1. Removal of the spleen following traumatic rupture does not alter life expectancy, assuming that the patient has fully recovered from the effects of the trauma and operation and there are no postoperative complications. The same statement applies to splenectomy for idiopathic thrombocytopenic purpura and familial hemolytic icterus. In fact, life expectancy in these conditions may actually be increased, since splenectomy often prevents fatal complications for many years. Several patients now under observation were subjected to splenectomy fifteen to twenty years ago for these diseases and others, such as Gaucher's disease, and they show no deleterious effects attributable to the absence of a spleen. The various functions of this organ are taken over by other organs or tissues of the body. Resistance to various infections, for example, is just as high in these patients after splenectomy as before.

2. The practice of insurance companies with regard to life insurance following splenectomy for traumatic rupture is, in general, as follows: No insurance is issued during the first two years after operation. During the third and fourth years insurance is issued at rates slightly higher than standard. Five years after splenectomy, if there is no complicating disease, the person is insured at standard rates. Apparently during the first two years insurance companies believe there is still a risk of complications secondary to the trauma and operation. If the person is normal five years postoperatively his life expectancy is considered normal. Since the number of cases of splenectomy for traumatic rupture is relatively small, an accurate statistical evaluation of life expectancy is not available to insurance companies as yet. The few persons under observation have not differed in this respect from the general population.

STRABISMUS IN A YOUNG CHILD

To the Editor—In Queries and Minor Notes in The Journal, Jan. 3, 1942, page 93, with reference to strabismus in a young child, your correspondent stated that the good eye should be occluded to compel the use of the other eye to prevent amblyopia. You state that this is "important for several years." You further state that if due care is exercised along these lines, "operation may be postponed indefinitely without the sight becoming impaired."

I wish to take exception to these statements. Binocular vision is developed during the first five or six years of life, and even if the visual acuity is maintained by covering first one eye and then the other (which is seldom done) binocularity has been lost to the patient by this form of treatment. By postponing the operation the patient loses the opportunity to develop binocularity and is encouraged to form vicious habits such as abnormal retinal correspondence or alternate suppression of one or the other eye.

The indication in this case is a definite diagnosis as to whether the case is concomitant or paralytic as suggested by the writer, an examination under atropine to determine the refractive condition and the use of glasses if needed.

If the case is paralytic, 3 to 5 drops of saturated solution of potassium iodide three times a day after eating should be given over a long period and the encouragement of the head position for the maintenance of binocularity.

If the case is concomitant, patching of the good eye, use of glasses if needed, and early orthoptic training are indicated. After one year of this type of care, if the squint has not been relieved, operative procedures are indicated in order to give the child an opportunity to secure binocular vision in early life.

Oscar Wilkinson, M.D., Washington, D.C.

NOTE.—The letter was referred to the authority who prepared the reply. He writes:

To the Editor.—The statements to which the critic takes exception are well established. His advice as to treatment is for the most part routine. The writer of the question was not interested in routine ophthalmologic treatment. There is a difference of opinion about the best age at which to operate. A great majority of children are not operated on until they are between 8 and 12 years of age, and good results are obtained. A minority who are fond of operating advocate early operation. It has not been shown that their results are better. Reoperation is often necessary later. The critic's remark that postponing operation means giving up hope of "binocularity" is not borne out by the facts.

THE MENOPAUSAL SYNDROME

TREATMENT WITH THE IMPLANTATION OF
CRYSTALLINE ESTRONE PELLETS

HENRY G. BENNETT JR., M.D.

AND

RICHARD W. TE LINDE, M.D.

BALTIMORE

The principle of estrogen replacement therapy in the management of the menopausal syndrome is well established as sound. Estrogen preparations of proved potency have become available during the past decade, and many satisfactory therapeutic results have been reported. The standard method of administration of these estrogen preparations, however, is far from satisfactory as it requires frequent hypodermic or intramuscular injections of the hormone preparations, usually in oil solutions, repeated as often as two to three times each week. Obviously, if it was possible to supply a patient's estrogen requirement for weeks or even months with a single injection, the ideal method of replacement therapy would be more nearly attained.

An approach toward such an ideal method came to hand in 1937 when Deanesly and Parkes¹ announced a new technic in hormone administration whereby solid pellets of crystalline hormone were implanted subcutaneously to be absorbed slowly over a long period of time. Such pellets they found effective in producing prolonged hormonal stimulation in laboratory animals. A year later Bishop² treated a young human castrate with a similar subcutaneous pellet of estrone and reported partial relief of menopausal symptoms for five weeks.

Following these promising introductory reports it seemed worth while to subject this new method to extensive clinical trial. Therefore in the fall of 1938 such a study was begun in the gynecologic dispensary of the Johns Hopkins Hospital and a preliminary report of the results in 21 menopausal patients treated with subcutaneous theelin (estrone) pellets was made.³ In this series of patients it was found that, after the implantation of theelin (estrone) pellets, relief of subjective symptoms began within two weeks and persisted as long as fourteen and a half weeks. Objectively it was demonstrated that the urinary estrogen

level rose and remained elevated for correspondingly long periods, that the urinary level of gonadotropic hormone was depressed in 60 to 70 per cent of the cases and that prolonged stimulation of the vaginal mucosa occurred as observed in biopsy specimens. These objective findings were interpreted to show beyond doubt that the theelin (estrone) was absorbed constantly from the implanted pellets for long periods of time and that the estrogenic properties of the absorbed theelin were not impaired by the pellet method of administration.

Other investigators have since reported the effects of various estrogens administered by the pellet method. MacBryde, Freedman, Loeffel and Allen⁴ treated 6 surgical castrates with 100 mg. diethylstilbestrol pellets implanted into a small incision in the lumbar region. Vaginal smears showed complete estrous change in seven to ten days. Endometrial biopsies showed "active proliferation" as early as seven days after implantation. Subjective improvement occurred in all cases and persisted as long as the pellets were in place, but symptoms recurred in two to three weeks after the pellets were removed.

Twombly and Millen⁵ used 20 mg. pellets of estradiol implanted through a 10 gage needle. Each of the 43 menopausal patients treated received a total of one to three pellets given at intervals of one month. All except 1 of these women showed "moderate to marked improvement or complete cessation of symptoms," and the improvement continued for five to six months. Objective evidence of prolonged estrogen stimulation was demonstrated in endometrial biopsies and vaginal smears.

More recently Mishell⁶ reported his experience with 45 to 65 mg. pellets of crystalline estrogens obtained by extraction of pregnant mare's urine. One pellet was implanted in each case through a small incision just above Poupart's ligament. In a series of 19 menopausal women thus treated, all except 1 were relieved of hot flushes for periods of three to five months.

In connection with the pellet method of estrogen administration, mention should be made of a variation of this technic used by Salmon, Walter and Geist.⁷ They implanted loose crystals of α -estradiol benzoate through a skin incision 1 inch in length. Doses of 4 to 7 mg. were used. Clinical relief of menopausal symptoms in 10 patients and estrous changes in the vaginal smear persisting for sixty to ninety-eight days were reported. Later the same authors reported a

From the Department of Gynecology, Johns Hopkins University School of Medicine.

This study was made possible by a grant from the Rockefeller Foundation Fluid Research Fund.

series of 7 cases treated with the same technic but with larger doses varying from 25 to 50 mg. of crystalline α -estradiol or α -estradiol benzoate.⁸

The present study is concerned with the treatment of 45 menopausal patients in whom we have implanted theelin (estrone⁹) pellets subcutaneously. Preliminary observations in 21 of these cases have been previously reported.³

TECHNIC

As described earlier,³ our pellets are made by direct compression of pure crystalline estrogen in drilled, machine ground, steel plates. The pellets used are 1.83 mm. in diameter, 2 to 5 mm. in length and 5 to 10 mg. in weight. The estrogen pellets are sterilized in a dry steam autoclave at 250 F. under 15 pounds of pressure for thirty minutes. Implantations in our patients are made through a 12 gage hollow needle fitted with a stilet. The pellets are loaded into the pointed end of the needle with small forceps and the needle is passed through the skin over the gluteal region after procaine infiltration. Pressure on the stilet as

Technic of implantation.

the needle is withdrawn deposits the pellets in the subcutaneous tissues, as shown in the illustration. Sterile technic is, of course, observed throughout the implantation procedure.

DOSAGE

The number of implantations per patient has varied from one to five, the average number being one and one half. The average number of pellets per implantation has been eight; the average total weight of estrogen in each implantation was 40 mg. In some of the early cases considerably smaller doses were used, but during the past year a standard dose of 50 mg. has been used almost routinely. This usually requires six to eight of our tablets.

CLINICAL RESULTS WITH THEELIN (ESTRONE) PELLETS

In evaluating our results we have, as most other investigators, considered the relief of hot flushes to be the most definite criterion. Table 1 shows our clinical results with pellet implantation of crystalline theelin (estrone) pellets, and a comparison is made between

this method of therapy and others with which we have had experience. Of the 45 patients treated with theelin (estrone) pellets, 93.4 per cent considered the results satisfactory. In many of these patients hot flushes disappeared completely, though it is not to be inferred that such was invariably the case. However, in all these cases classed as satisfactory the flushes had decreased to the point at which the treatment was considered by the patient to be highly satisfactory. In most instances the improvement of flushes went hand in hand with an improvement in the patient's sense of well being. Improvement usually began within two weeks following implantation. The great advantage of the pellet method of administration of estrogenic hormone lies in the prolonged duration of the relief of symptoms. Our patients were relieved for an average period of sixteen and two-tenths weeks. The shortest term of relief following one implantation was three weeks and the longest sixty-five. It is probable that the latter patient spontaneously recovered from the menopausal syndrome while under estrogen therapy. None of those who had been previously treated with estrogens administered by hypodermic injections showed less improvement from pellets, and in most cases the degree of relief was definitely greater with pellet implantation.

The use of theelin (estrone) pellets has been remarkably free from unpleasant side effects. At the outset we felt that the introduction of such foreign bodies as our pellets would in certain cases give rise to tenderness, pain or other evidence of local inflammation. Our observations now extend over a period of nearly three years, and in no case has such a reaction been observed in our patients. With theelin pellets we have seen no instance of nausea, vomiting or other evidence of systemic, toxic reaction. In no instance has there been objective evidence of breast hypertrophy, chronic cystic mastitis or subjective complaints suggesting such changes. In 1 case, however, abnormal uterine bleeding did occur, consisting of scanty bleeding for one day appearing three weeks after pellet implantation. It is interesting to note that this particular patient had previously been subjected to roentgen ray castration because of prolonged functional bleeding.

COMPARISON WITH OTHER METHODS OF THERAPY

In order the better to evaluate the apparent advantages of the theelin (estrone) pellet method of therapy in the menopause we have thought it necessary to present for comparison our results with other therapeutic methods. As shown in table 1, we have treated 145 menopausal women with diethylstilbestrol administered orally. Of 74 patients taking a daily dose of 0.5 mg. or less, only 60.8 per cent were satisfactorily improved. That a larger dosage is more effective is demonstrated in the group of 71 patients, receiving 1 mg. or more of diethylstilbestrol a day, of whom 85.9 per cent showed satisfactory improvement. The greatest apparent success with diethylstilbestrol occurred in the group of 12 patients who received subcutaneous pellets in an average total dose of 53.5 mg. In all these patients the clinical results, with regard to hot flushes, were satisfactory. Thus it is seen that small doses of diethylstilbestrol given by mouth cannot be relied on as adequate but that in oral doses of 1 mg. or more a day or when given as subcutaneous pellets in average doses of 53.3 mg. diethylstilbestrol is reasonably efficient as compared with theelin pellets as far as the clinical relief of symptoms is concerned.

8. Salmon, U. J.; Geist, S. H., and Walter, R. I.: *Proc. Soc. Exper. Biol. & Med.* 43:424 (Feb.) 1940.

9. The crystalline estrogen used in this study was supplied as "Theelin" by Parke, Davis & Co. and as "Estrone" by Eli Lilly & Co.

However, when the undesirable side effects are considered, diethylstilbestrol suffers in comparison. When given in oral dosage adequate to insure satisfactory clinical results, diethylstilbestrol induced nausea in 15.5 per cent of the patients. Of those who received diethylstilbestrol pellets nausea, beginning within twenty-four hours after implantation and persisting for seven to ten days, occurred in 16% per cent. It is of interest to note that vomiting did not occur in these cases and that the nausea disappeared after seven to ten days in spite of the fact that the pellets were not removed. In addition to these toxic systemic reactions it is startling to find that abnormal uterine bleeding occurred in 36.3 per cent of women with intact uteri receiving 1 mg. or more a day orally. Of the 12 patients treated with diethylstilbestrol pellets 5 had undergone hysterectomy. In the 7 women with intact uteri abnormal bleeding occurred in 5. Even in cases treated with diethylstilbestrol orally in doses too small to insure clinical improvement the incidence of nausea and abnormal uterine bleeding exceeded that found with theelin pellets.

TABLE 1.—Subjective Improvement

Treatment	Cases	Satisfactory		Un- satis- factory	Per Cent Satis- factory	Per Cent Un- satis- factory

Phenobarbital.....	24	4	8	12	50.0	50.0

* Reed and Carnrick, "Estrogenic Hormone."

In fairness, however, it should be acknowledged that diethylstilbestrol is of the first importance in the investigative phase of menopausal therapy today. Its chief advantages are that it can be effectively administered orally and that it will probably be inexpensive. Since the discovery of diethylstilbestrol by Dodds and his co-workers¹⁰ in 1938 numerous clinical and laboratory studies have proved its high estrogenic potency, even when administered orally. Several investigators have reported it satisfactory in the treatment of menopausal patients. Because of the wide range of dosage employed, varying from 0.1 to 5.0 mg. even in a single study, and because of a lack of agreement as to the frequency of toxic reactions, additional data are needed before the true clinical value of this preparation can be determined.

Another group of patients were treated with theelin crystals in aqueous suspension¹¹ administered hypodermically in total doses of 5 to 25 mg. given in single injections of 5 to 10 mg. Satisfactory clinical results were obtained in only 59.3 per cent of 27 patients. A small group of 13 cases were treated with natural

estrogen¹² administered in the form of an oral tablet three times a day. The results were considered satisfactory in only 46 per cent.

Finally a group of 24 patients were treated with phenobarbital in doses of $\frac{1}{4}$ and $\frac{1}{2}$ grain (0.016 and 0.032 Gm.) three times daily. Just half of these reported

TABLE 2.—Relation Between Duration of Symptoms Before Treatment and Clinical Improvement After Treatment

		Completely	Partially	
Less than one year.....	20	95.0%	5.0%
More than one year.....	25	60.0%	33.0%	8.0%

satisfactory results. It should be pointed out that the percentage of completely satisfactory results obtained with phenobarbital was quite low. Although sedatives have been justly replaced in a large measure by hormones in the treatment of menopausal symptoms, our results indicate that sedatives such as phenobarbital do give some relief in a goodly percentage of the cases and may be very useful in those cases which do not respond to endocrine therapy.

It has been our impression in dealing with menopausal women that those who are in what might be termed the acute phase of the menopause respond to treatment better than those who have complained of flushes and other symptoms for one, two or more years. One occasionally sees women complaining of flushes ten or more years after their last period. In addition to the flushes, such women often have developed a multiplicity of vague complaints. It appears that many of these patients have found their menopausal symptoms, which at first were real, a convenient expression of their neurotic natures. With the idea of determining whether this admittedly preconceived idea was correct, we divided the women into two groups, those whose symptoms had been present for less than a year and those in whom symptoms had been present for over a year. Table 2 shows the results. It is obvious from this table that the results in both groups were considered satisfactory in over 90 per cent but that 95 per cent of the patients who had had symptoms for less than one year acknowledged that the implantation had completely relieved them. On the other hand, of those who had complained

TABLE 3.—Relation Between Type of Menopause and Clinical Improvement After Treatment

Type of Menopause	Cases	Satisfactory		Unsatisfactory
		Completely	Partially	
Physiologic.....	26	73.1%	15.4%	11.5%
Surgical castration.....	14	53.7%	14.3%
Irradiation castration.....	5	60.0%	40.0%

for over a year, only 60 per cent admitted complete relief. We are inclined to interpret this as indicating that a certain amount of chronic invalidism had developed in many patients of the latter group which naturally could not be cured by endocrine therapy. This suggests to us the desirability of prompt treatment when menopausal symptoms develop before the woman becomes too firmly established as a hypochondriac.

10. Dodds, E. C.; Goldberg, L.; Lawson, W., and Robinson, R.: *Nature*, London 141: 247 (Feb. 5) 1938.

11. The theelin crystals in aqueous suspension were supplied as "Theelin" by Parke, Davis & Co. and as "Estrone" by the Abbott Laboratories.

12. The natural estrogen was supplied as "Estrogenic Hormone, Oral," by the Reed Carnrick Company.

We felt that it might be of interest to determine which type of menopause responded best to pellet implantation of estrone. Accordingly we divided the cases into three groups, the physiologic, the surgical and the irradiated group. Our results are shown in table 3. There were only 5 cases in the last group, and the figures are probably of little significance. Suffice it to say that all of the irradiated group obtained relief but that in 2 of the 5 the relief was only partial. The surgical castrates responded better than either of the other two groups. We are inclined to feel that the reason for this is that most of these patients were castrated in our clinic and were still in close touch with the clinic when their symptoms developed. Hence they were brought under treatment earlier, which we believe is an important factor in the success of treating menopausal women.

The question of the value of the vaginal smear in determining indications for and the results of treatment should be considered in view of the report of Papanicolaou and Shorr.¹³ These investigators lay great stress on the vaginal smear as a means of determining whether symptoms are truly menopausal or psychic in origin. They state that "the menopausal type of smear

TABLE 4.—*Abnormal Bleeding in Patients with Intact Uteri*

Treatment	Cases	Scanty	Profuse	Abnormal Bleeding
Theelin pellets (estrone).....	28	1	0	3.5%
Diethylstilbestrol pellets . . .	7	2	3	71.5%
Theelin crystals in aqueous suspension	14	1	1	14.3%
Oral diethylstilbestrol (0.5 mg. or less daily)	45	3	1	8.8%
Oral diethylstilbestrol (1.0 mg. or more daily)	44	6	10	36.3%
Natural estrogens (oral)	10	0	0	0.0%
Phenobarbital	16	0	1	6.3%

is invariably present after the menopause whether or not symptoms exist. In the latter instance it acquires special significance in that it furnishes an objective index of the symptomatic state." We cannot agree with this completely, for we have seen vaginal smears from untreated castrated women showing an abundance of pure large flat epithelial cells such as one usually finds in younger women with an abundance of estrogen. Of special interest was one woman of 30 who had been surgically castrated three years before. She was having typical severe hot flushes but her vaginal smear showed none of the characteristics of the so-called castrate smear. In general, however, it is true that most symptomatic menopausal women have smears suggesting estrogen deficiency and under the influence of the implanted estrone the smears become of the estrogenic type, but we have frequently noted relief from symptoms without any change in the vaginal smear. Frequently symptomatic relief preceded any change in the vaginal smear and we are inclined to believe that the dosage necessary to relieve the symptoms in many women is less than is required to alter the vaginal epithelium. We do not feel that it is necessary for the practitioner who is treating menopausal symptoms to follow the vaginal smears. In fact, to be guided entirely by the smears would in some instances be misleading. It is a better rule to be guided by relief of symptoms.

UTERINE BLEEDING

The production of uterine bleeding in postmenopausal women has frequently been noted by several investigators in the field of estrogenic therapy; hence we are interested in the effect of the implanted pellets of estrone as regards bleeding in the women with intact uteri. Table 4 gives our results. It might be well to define "abnormal bleeding" as recorded in this table. We have considered abnormal bleeding to be intermenstrual bleeding or excessive menstrual bleeding in those patients who were still having their periods. In women who had ceased menstruating for one year or more, any show of blood was considered abnormal. There were 28 cases in the group treated with estrone pellets in which the uteri were intact. Of these, only 1 bled scantily. One wonders whether this bleeding was coincidental or caused by the hormone. As a control, one might consider the 16 cases treated only with phenobarbital. One of these women also bled. This bleeding was certainly coincidental to the treatment but it illustrates the well known likelihood of menopausal bleeding to occur spontaneously. Hence it would seem fair to judge from the results that there is no evidence that the estrone pellets were responsible for bleeding in this group. Twombly and Millen,⁵ on the other hand, found that out of 12 patients treated with pellets of α -estradiol 9 bled. From this they justly concluded that the pellet treatment with α -estradiol is contraindicated in women with intact uteri. No such contraindication would seem to exist when pellets of estrone are used. In a small group of 7 patients with intact uteri treated with diethylstilbestrol pellets, 5 bled. Although this is a very small series, the incidence of bleeding is so great that it would seem to indicate that the use of pellets of diethylstilbestrol is definitely contraindicated in women with intact uteri. The table indicates also that when diethylstilbestrol is administered by mouth in sufficient dosage to make relief of symptoms reasonably sure (1 mg. or more a day) bleeding occurred in 36.3 per cent. Estrone crystals were given in aqueous solution in 14 cases. In 2 there followed abnormal bleeding, whereas in the small group of 10 to whom naturally occurring estrogens were administered by mouth, none bled. It is noteworthy that the therapeutic results in this small group were not very satisfactory.

The importance of using an estrogen which does not cause bleeding at or after the menopause cannot be too strongly stressed, for when the bleeding occurs one cannot be certain whether it is due to the endocrine treatment or is dependent on some serious lesion such as corpus carcinoma and the decision can be made only by curettage. Obviously a preparation which will not cause bleeding is of much advantage, and estrone administered by pellet implantation would seem to fit this category.

In searching for an explanation of the frequent bleeding with diethylstilbestrol, we have called on our experience in treating children for gonococcal vaginitis. It would seem that diethylstilbestrol is more potent in its hormonal action as regards growth stimulation than the natural hormone. For instance, we frequently noted excessive uterine growth when the children were treated with diethylstilbestrol, and this was never noted when the natural hormone was used in comparable dosage by weight, even though the local action of the natural estrogen on the vaginal mucosa was just as effective. The bleeding so frequently noted when dieth-

ylstilbestrol is used for menopausal symptoms would seem to depend on this same growth stimulating action on the uterus, for when these bleeding uteri are curetted we usually see evidence of endometrial proliferation in the production of the Swiss cheese glandular pattern and frequent mitoses in the glandular epithelium.

Since the question of the carcinogenic action of estrogenic substance has been raised, it might be in order to consider the possibility of such action when estrogenic pellets are implanted. As already stated, evidence of benign endometrial proliferation was frequently noted when diethylstilbestrol was used, but we have no histologic evidence of this when pellets of estrone were used. Furthermore, we have no clinical evidence from our series that pellet implantation of either estrone or diethylstilbestrol was responsible for any malignant change. Lipschütz and Vargas¹⁴ produced "fibromas" in the uteri of guinea pigs by repeated injections of estradiol and even more effectively produced "fibromas" when tablets of estradiol were implanted. The tumors so produced were all benign and retrogressed when treatment was discontinued. Nelson¹⁵ also produced uterine fibromas in guinea pigs by injecting large amounts of estrogenic hormones. Perloff and Kurzrok¹⁶ implanted pellets of estradiol benzoate in guinea pigs and produced uterine fibromas, but they were unable to do so when pellets of estrone were used. Our clinical experience with pellet implantation causes us to doubt whether these interesting laboratory observations have any clinical bearing; but, if they do, they would seem to indicate that estrone is the weakest growth stimulator of the various estrogens.

LABORATORY AND OBJECTIVE EVIDENCE OF ESTROGENIC ACTIVITY INDUCED BY PEL- LET IMPLANTATION OF ESTRONE

When estrogen replacement therapy is adequate, it is possible to demonstrate certain objective evidence of the presence of the replacing estrogen and also evidence of its physiologic activity, as indicated by changes in the genital organs and by the tendency toward decrease of the pituitary gonadotropic hormone. Such evidence is essential in proving the effectiveness of any estrogenic substance and the efficiency of any particular method of estrogen administration. Therefore in a considerable number of our patients we have made periodic determinations of the urinary levels of estrogenic substance and gonadotropic hormone before and during therapy and in certain cases studied vaginal biopsies. Repeated urinary estrogen assays were done in 21 cases. In about three fourths of these cases no estrogen was detected before treatment. In the remaining cases the urinary estrogen excretion in twenty-four hours before treatment was never more than 5 rat units, which in our laboratory represents the lower limit of normal for a menstruating woman. After pellet implantation, however, all cases have shown definite and persistent increase in the urinary estrogen, the average post-treatment level being 10 rat units in twenty-four hours. In about one fourth of the cases the level has been above 15 rat units per liter, which in our laboratory is close to the upper limit of normal for menstruating women. The average observed duration of the estrogen increase in the urine

has been twenty to twenty-four weeks, but in 1 case the elevation persisted for forty weeks.

Urinary follicle stimulating hormone levels have been followed before and during therapy in 35 instances. In 20 the level before treatment was 25 rat units per liter or more while in 15 cases no elevation was detected. Only 50 per cent of those showing a pretreatment elevation of the follicle stimulating hormone showed a persistent absence of follicle stimulating hormone following pellet implantation. However, in the 10 cases in which suppression did occur it was observed to persist for an average period of twenty-one weeks and in 1 case for forty weeks.

As previously reported, vaginal biopsies in 10 patients showed uniform stimulation of the vaginal mucosa appearing within two weeks and persisting as long as twenty-one and a half weeks after pellet therapy.

CONCLUSIONS

We believe that the pellet implantation of crystalline estrone is the most effective method yet devised of combating the menopausal syndrome, being satisfactory in 93.4 per cent of our cases.

The implantation of pellets as here described is a very simple procedure.

The hormone administered by implantation is effective over a longer period of time than when administered by any other method.

Implanted crystalline estrone pellets produced no untoward side effects in contrast to pellets of diethylstilbestrol (or estradiol reported by others).

The treatment was more completely effective in cases in which the symptoms were present for less than a year, which to us suggests the value of early treatment before the neurasthenic tendencies of the patient are developed. There is, of course, the possibility that the symptoms persist for more than a year only in the more severe cases and hence they are more refractory to treatment.

We do not believe that the vaginal smear is an altogether dependable indicator of the necessity of estrogen treatment in the menopause nor is it of any great clinical value as an indicator of the effectiveness of the treatment of the symptoms. Although we feel that laboratory determinations of urinary estrogenic levels and gonadotropic hormone levels are valuable in evaluating a new therapeutic method, such determinations are not necessary in order to carry out satisfactory therapy in the individual patient.

The Basis of Civilization.—Science has thus become the basis of civilization and is the primary factor in promoting its growth. Just as earlier society was based on agriculture and local trade, so modern communities are built on the scientific foundation which makes possible rapid transportation and communication, the preservation and distribution of food and adequate sanitation. With only primitive knowledge of metallurgy, mechanics, electricity, chemistry and hygiene, our cities could not exist, and, with them gone, country life also could have only a primitive form. Science has thus proved its practical strength, and the indications are that the future of mankind lies in the hands of those who guide their actions by carefully acquired scientific knowledge. With science and its correlated industries, there is every reason to anticipate a continuation of the rapid growth and development of civilization, except in those regions and periods where political unrest turns men's attention to less scientific matters.—Compton, Arthur H.: *Science, Religion and a Stable Society*, *Assn. RENAL COMPLICATIONS FOLLOWING
SULFATHIAZOLE THERAPY

TRAVIS WINSOR, M.D.
AND
GEORGE E. BURCH, M.D.
NEW ORLEANS

Since the introduction of the thiazole derivatives of sulfanilamide by Fosbinder and Walter¹ in 1939, renal complications following the use of sulfathiazole have been observed in the experimental animal and to a limited extent in the treated patient. Only 23 instances have appeared in the literature in which sulfathiazole produced apparent renal damage in the human being; in 21 instances there was hematuria, in 7 there was nitrogen retention, and in 2 sulfathiazole was the probable cause of death.

Garvin² treated 54 patients for pneumonia, using 10.0 Gm. of sulfathiazole daily, a dose necessary to maintain a blood sulfathiazole level of 5.8 mg. per hundred cubic centimeters. Of these patients 14.8 per cent had gross or microscopic hematuria. One developed renal colic. Abernethy,³ treating 31 patients with pneumonia, used 40 Gm. of sulfathiazole orally over a period of seven to ten days. One developed hematuria and another showed oliguria and nitrogen retention. Wagoner and Hunting,⁴ in the management of 55 patients, administered sufficient sulfathiazole to keep the blood level between 4.0 and 6.0 mg. per hundred cubic centimeters for a period of five days. Only 1 patient developed hematuria. Flippin and his co-workers,⁵ in treating 100 patients with 30 Gm. of sulfathiazole in four days, reported 9 instances of microscopic hematuria. In no patient was nitrogen retention or oliguria noted. Culp⁶ treated 30 patients having urinary tract infections, using a large initial dose and 1 Gm. of the drug every six hours thereafter for five to ten days. No oliguria or hematuria was noted. Knoll and Cooper⁷ used 22 Gm. of sulfathiazole in five days while treating a man aged 81 for pneumonia. The blood sulfathiazole level was 6.7 mg. per hundred cubic centimeters. The patient developed gross hematuria, a blood nonprotein nitrogen of 63 mg. per hundred cubic centimeters and oliguria, all of which returned to normal in four days after discontinuation of the drug. No permanent renal damage was apparent. Horack⁸ treated a woman aged 77 for pneumonia. Hematuria and a significant rise in the blood urea nitrogen were observed within eighty hours. Following the withdrawal of the drug there was little improvement of renal function, and the patient died on the ninth hospital day. At necropsy the kidneys were pale and swollen. On sec-

tioning, streaks of gritty material could be seen and felt in the region of the medulla. The tubules were dilated and the pyramids were obstructed by large crystalline masses. Lowenberg, Sloane and Chodoff,⁹ however, reported that a woman aged 49 was given 52 Gm. of sulfathiazole in ten days without clinical signs of renal damage. The blood sulfathiazole level ranged between 5 and 7.6 mg. per hundred cubic centimeters. At necropsy the bladder, ureters and tubules were packed with crystals. There was no pathologic evidence of parenchymal damage. In this case the presence of crystals in the urinary tract and even crystals in the tubules themselves did not necessarily mean that damage to the kidneys had taken place. Sulfathiazole may or may not have been a factor contributing to the death of the patient.

Many observations conducted on experimental animals to study the nature of the renal damage from this drug showed lesions to be reproducible and frequently irreversible. Rake, van Dyke and Corwin¹⁰ found that 77 per cent of mice ingesting sulfathiazole to the extent of 2 per cent of their diet died within four weeks. At autopsy, crystals were present in the urinary tract from the proximal convoluted tubules to the urethra. Bowman's capsule was dilated and occasionally filled with blood. The renal tubules also were dilated, were filled with crystals and showed definite peritubular leukocytosis and occasionally tubular necrosis. Half of the animals had definite concretions in the pelvis or ureters. The damage to the kidneys seemed to the authors to be of two distinct types: 1. There was mechanical blocking of the urinary passage, producing either obstruction to the renal tubules with a resultant tubular hydronephrosis or obstruction to the ureters with a ureteropelvic hydronephrosis. 2. There seemed to be a primary toxic effect on the glomeruli and tubules directly, as shown by hemorrhage into Bowman's capsule and changes in the glomeruli and glomerular basement membrane.¹¹

In rats, in contrast to mice, sulfathiazole is less toxic as far as renal injury is concerned, probably because of the rapid rate of metabolism of sulfathiazole in this animal.¹⁰ Sulfathiazole produced renal calculi rarely in monkeys, owing probably to this animal's normal rapid excretion of the drug.¹⁰ Climenko, McChesney and Messer¹² showed that the continued oral administration of sulfathiazole to dogs produced mild impairment of renal function. These changes were reversible, returning to normal within forty-eight hours following the withdrawal of the drug. Gross, Cooper and Scott¹³ clearly demonstrated tubular blockage following sulfathiazole administration in white rats, using frozen sections and polarized light to visualize the crystals.

The mechanism of the renal damage produced by the sulfonamides varies. Wood¹⁴ reported a case in which sulfanilamide was administered, with development of

an acute hemolytic anemia and subsequent death in uremia. At autopsy the convoluted and collecting tubules were packed with pigmented casts, which reacted positively to the iron stain. This type of renal damage is similar to that found in blackwater fever.

Fig. 1 (case 1).—Section of kidney in which there is thickening of the glomerular basement membrane. Adjacent to Bowman's capsule is an area of lymphocytic infiltration.

Sulfathiazole has not produced renal damage in this fashion to our knowledge. Antopol¹¹ pointed out that changes in the renal parenchyma could take place with or without urolith formation in animals receiving sulfapyridine and that the crystal formation in the tubules may either precede or follow tubular damage. That the drug is irritating in itself is shown by the acute gastritis which follows oral administration and the hemorrhagic reaction in the bowel which follows rectal instillation. Histologic changes were produced with sulfathiazole in the kidneys of the monkey which were similar to those found in man. In many of the animal experiments much larger doses than those used for therapeutic purposes in man were administered.¹⁵

In view of the relatively few reported instances of renal damage by sulfathiazole in man, the indiscriminate use of the drug by many, and the possibility that most patients who receive the drug are not properly studied for evidences of renal changes, it was considered warranted to report 6 cases from Charity Hospital in which renal injury developed following the administration of sulfathiazole.

REPORT OF CASES

For brevity these cases are condensed, only the data relating to discussions in the paper being presented.

CASE 1.—E. P., a Negro woman aged 37, married, a laundress, entered Charity Hospital on Sept. 19, 1941 complaining of chest pain of five days' duration. She died on September 25.

She presented a typical clinical picture of acute pericarditis and left fibrinous pleuritis with nausea and vomiting of five days' duration and a history of limited intake of fluids and food. The liver was moderately enlarged and soft, and the right kidney was large and movable. There was no ascites or edema. Ten days prior to admission she had a perirectal abscess drained.

There was moderate anemia and leukocytosis. The urine had a specific gravity of 1.014, 4 plus albumin and no erythrocytes.

Five hours after her admission on September 19, 3 Gm. of sulfathiazole was administered by mouth. In the following two days she received 6 Gm. of sulfathiazole orally each day. On September 22 she was given three doses of 40 cc. of 5 per cent sulfathiazole intravenously. Each day on which sulfathiazole was given, 2,000 cc. of intravenous fluids was administered in addition to that drunk. On September 22 the drug was stopped because of oliguria and the presence of red cells and sulfathiazole crystals in the urine. In three days she had received a total of 21 Gm. of the drug, 6 Gm. of which was given intravenously. Repeated urine examinations revealed a specific gravity of 1.014, 4 plus albumin and 10 to 15 erythrocytes per high power field. No casts were reported. On September 21 the blood urea nitrogen rose to 101 mg. per hundred cubic centimeters, the blood sulfathiazole was 21 mg. per hundred cubic centimeters and the carbon dioxide combining power was 22 volumes per cent. By September 25 her fluid output was only 5 cc. On this day her temperature rose to 102 F., the pulse rate was 180 per minute, the respiratory rate was 45 per minute and the patient died.

On postmortem examination, the pericardial cavity contained 20 cc. of purulent fluid, and shaggy fibrinous adhesions were present between the visceral and the parietal pericardium. The left pleural space contained 100 cc. of purulent exudate. The kidneys were enlarged, the right weighing 390 Gm. and the left 280 Gm. They were smooth, swollen and pale and showed no hemorrhage or crystals. The pelvis and ureters were not dilated. The bladder showed numerous submucosal hemorrhagic areas in the region of the trigone.

On microscopic examination¹⁶ the kidney capsule was thin. The glomeruli were slightly decreased in size, appeared somewhat acellular and showed considerable thickening of the basement membranes. The glomerular spaces were dilated and contained a moderate amount of eosinophilic granular material. A few hyalinized glomeruli were noted in the cortex. The tubules were all dilated, and many contained an eosinophilic granular amorphous material. This was most pronounced in

Fig. 2 (case 1).—Section of kidney in which the tubules are dilated. An area of leukocytic infiltration and hemorrhage is seen. The tubular epithelium is flattened. There is some interstitial edema and fibrosis.

the convoluted tubules, which were lined by a flattened type of epithelium. There was an increase in the interstitial fibrous tissue associated with slight edema. There was a diffuse lymphocytic infiltration throughout the cortex (figs. 1 and 2).

15. Sunderman, F. W.; Pepper, D. S., and Benditt, Eleanor: Sulfathiazole in Blood and Urine, *Am. J. M. Sc.* 200:790-795 (Dec.) 1940. 16. Dr. Joseph Ziskind of the Department of Pathology, Tulane University Medical School, evaluated the microscopic sections.

On the first examination, no mass in the right upper quadrant was found. This was detected only after sulfathiazole was started and gave the examiners the impression that it was a right kidney that had become enlarged and that the sulfathiazole was responsible for this acute enlargement. Because of the acuteness and severity of the patient's illness, sulfathiazole was administered as described without the state of renal function having been previously determined. After having received 18 Gm. of sulfathiazole in three days, she was found to have a blood sulfathiazole level of 21 mg. per hundred cubic centimeters, oliguria (as little as 5 cc. a day) and a retention of nonnitrogenous products. The patient died shortly thereafter. Since no previous renal function studies were made, it is impossible to be certain that there was no antecedent renal damage. The history suggested the absence of any chronic renal disease. It was thought that, even though the sulfathiazole may not have been responsible for the

be done to learn the state of renal function before sulfathiazole is administered. 3. Sulfathiazole should probably not be given to a patient who is dehydrated or to one with severe renal damage. 4. Fluids should be forced while the drug is being administered, and oliguria, hematuria, a unilateral enlarging kidney or impaired renal function (determined by frequent urinalyses and renal function studies) should be indications to stop the drug. 5. Tissues should be studied by frozen section if crystals are to be found.

CASE 2.—A. A., a Negro woman aged 36, married, a housewife, was admitted to Charity Hospital on July 29, 1941 and died on August 2. Two weeks prior to admission to the surgical service an acute right salpingitis developed which had resulted in a pelvic abscess and diffuse peritonitis by the time of admission.

There were leukocytosis, increased sedimentation rate, a trace of albumin and many casts in the urine. An exploratory laparotomy was performed and the diagnosis confirmed.

On return to the ward the patient was given 5 Gm. of sodium sulfathiazole in 1,000 cc. of saline solution by the intravenous route. The following day the same total dose was repeated in divided amounts along with the intravenous administration of fluids. No sodium bicarbonate was administered. On Aug. 1, 1941, a catheterized specimen of urine was grossly bloody. The nonprotein nitrogen was 38 mg. per hundred cubic centimeters and the carbon dioxide combining power was 30 volumes per cent. She developed oliguria, abdominal distention, a temperature of 103 F. and signs of pulmonary edema. The latter was treated by sedation, phlebotomy, tracheal aspiration and 50 per cent dextrose solution intravenously. The patient died, August 2, with acute respiratory distress.

On postmortem examination the peritoneal cavity showed signs of diffuse peritonitis. The kidneys were pale, tense and swollen. The right kidney weighed 200 Gm. and the left 240 Gm. Sectioning produced a gritty sensation. The cut surfaces were pale and felt sandy and rough. The calices and pelves of both kidneys contained pale yellow, gritty crystals, which tended to clump together. The left ureter was dilated and congested, and its lumen contained a plug of crystals which completely blocked the ureter at the trigone of the bladder.

Microscopically the kidneys showed considerable distention of the capsular spaces with small glomerular tufts. Within these spaces there was noted much eosinophilic granular material. There was slight thickening of the basement membrane with no proliferation of the endothelium. The tubules were generally greatly dilated, especially in the cortical area. The cells lining the tubules were flattened and more atrophic than normal. The convoluted tubules showed considerable eosinophilic granular material. This was also found in the collecting tubules, but in minimal quantities. There was very slight interstitial edema. Occasionally small groups of lymphocytes were seen between the convoluted tubules. The capillaries were congested, and an occasional intertubular hemorrhage from these vessels was noted (fig. 3).

The patient showed signs of renal damage after the intravenous administration of 10 Gm. of sodium sulfathiazole in forty-eight hours. The hematuria, oliguria, azotemia and acidosis all pointed to renal involvement. Poor renal excretion may have been due to renal irritation from the massive peritonitis, to shock secondary to the infection as well as to the operation itself, and to dehydration due to fever, vomiting, catharsis and lack of administration of sufficient amounts of fluid. The delayed excretion as well as the intravenous administration of the drug would all tend to produce a high blood sulfathiazole level and a subsequent hyperacetylation of sulfathiazole in the liver and other organs of the body. Sunderman, Pepper and Benditt¹² have shown that the acetyl derivative of sulfathiazole is only one tenth as soluble in urine as is the free form of the

Fig. 3 (case 2).—Section of kidney in which the tubules and Bowman's space are dilated and an eosinophilic granular material is in their lumens. The free borders of the tubular epithelium are frayed and ragged. There is some thickening of the glomerular basement membrane.

primary renal damage, it probably produced the final oliguria and uremia.

At necropsy, no evidence of uremic pericarditis was seen. Frozen sections of the pericardium and myocardium were made, as it was felt that crystal formation in the heart muscle or pericardium itself could be a factor contributing to the pericarditis. No crystals were found. Frozen sections of the kidneys, however, showed the presence of crystals which completely filled and obstructed the renal tubules. Paraffin section of these organs stained with hematoxylin and eosin revealed no crystal formation. The tubules were dilated and showed signs of tubular degeneration and other signs of sulfathiazole damage.¹¹

Several facts may be learned from this case: 1. Before giving sulfathiazole, one must be sure that the patient has not already taken the drug without the knowledge of the doctor. The high blood level of sulfathiazole may have been due to use of the drug before admission to the medical wards. If in doubt, a blood sulfathiazole determination should be made before the drug is administered. 2. Renal function tests should

drug and that both are half as soluble in urine of p_H 5.6 as in urine of p_H 7.6. Recently observations by Curtis and Sobin¹⁷ corroborated this. Schwartz, Flippin, Reinhold and Domm,¹⁸ on the other hand, found that alkalization decreased the tendency toward urolith formation but little. Administration of sodium bicarbonate to this patient during sulfathiazole therapy probably would have lessened crystal formation in the kidney and ureteropelvis, especially since she showed a low blood carbon dioxide combining power. Necropsy showed renal damage which was comparable to that described by Antopol.²² The left hydronephrosis with urolith formation illustrates the mechanical damage to this patient. Although crystals were seen and felt grossly at the autopsy table in these kidneys, routine paraffin sections did not reveal their presence as they were dissolved out while the sections were being prepared. Frozen sections were not made. Sadusk, Waters and Wilson¹⁹ described 2 cases similar to this with calculi blocking the ureterovesicular orifice, with tubular dilatation and vacuolization and congestion of the glomerular tufts following the administration of sulfapyridine.

CASE 3.—C. G., a Negro woman aged 47, married, a housewife, entered Charity Hospital on Sept. 29, 1941 complaining of fever of three weeks' duration. She died on November 2.

On September 5 the patient contracted an infection of the upper respiratory tract which progressively descended, resulting in bronchopneumonia and right and left ventricular congestive heart failure. The physical findings supported the diagnosis.

The blood and urine examinations were normal. There was no gross or microscopic hematuria. Laboratory studies revealed a phenolsulfonphthalein excretion of 70 per cent in one hour, an antecubital venous pressure of 26 cm of water, a decholin circulation time from arm to tongue of fifty seconds and an ether circulation time from arm to lung of ten seconds.

During the first thirteen days of hospitalization she received 62 Gm of sulfathiazole by mouth. No sodium bicarbonate was given. On October 13 she complained of bilateral lumbar pain and an inability to urinate for the preceding sixteen hours. Urethral catheterization recovered a few drops of grossly bloody urine which was packed with sulfathiazole crystals. The blood pressure was 150 systolic and 90 diastolic. The blood sulfathiazole was 8 mg. per hundred cubic centimeters. Ureteral catheterization was done immediately, and when the catheters were passed a gritty sensation suggested the presence of numerous sulfathiazole crystals. There was no excretion of indigo carmine from either catheter in twenty minutes. The patient returned to the ward with a blood pressure of 82 systolic and 48 diastolic. In the first forty-eight hours the fluid intake was 8,500 cc. and the output was 780 cc. In the following ten days she received daily 4,000 cc. of fluids, 50 cc. of 50 per cent dextrose solution, 24 Gm. of sodium bicarbonate and 1½ grains (0.1 Gm) of digitalis. During this time the ureteral catheters were irrigated every two hours with warm isotonic solution of sodium chloride. In the twelve days following her hematuria the erythrocytes and sulfathiazole crystals disappeared from the urine and the blood urea nitrogen rose from 10 to 60 mg per hundred cubic centimeters. The patient was doing fairly well when she unexpectedly died on November 2, just twenty-one days after the onset of the hematuria.

At autopsy, the right kidney weighed 210 Gm and the left kidney 200 Gm. The capsules stripped with ease, revealing a fairly smooth purple surface which showed an occasional granular area in the region of the medulla. The cortex mea-

sured 0.7 cm. in thickness. The line of demarcation between the cortex and the medulla was distinct. The calices and pelves showed no abnormalities.

Microscopically the kidneys showed occasionally small scars just beneath the capsule, within which were a few atrophic tubules and occasional lymphocytes, plasma cells and large mononuclear cells. The glomeruli varied in size, most of them appearing smaller than normal. There was no proliferation of the endothelial or capsular cells, but the basement membranes were slightly thickened. Here and there the afferent arterioles showed thickening and hyalinization. There was moderate distention generally of the glomerular spaces, which contained in most instances an eosinophilic granular material. Moderate distention of the tubules, especially in the cortex, was noted. Many of the cells lining the convoluted tubules showed fraying of the free borders and albuminous degeneration. These tubules contained within their lumens an eosinophilic, granular amorphous material. Occasionally degenerating cells were noted in the lumens. A similar precipitate was present in the collecting tubules and some of Henle's loops but was not as well defined as in the proximal and distal convoluted tubules. There was

Fig. 4 (case 3).—Section of kidney in which Bowman's space contains an eosinophilic granular material. There is some thickening of the glomerular basement membrane.

not much separation of the tubules by interstitial edema. An occasional small focal area of lymphocytes and polymorphonuclear leukocytes could be seen in the peritubular tissues. This, however, was not constant (fig. 4).

The patient received 62 Gm. of sulfathiazole orally in twelve days, at which time backache heralded the onset of renal complications. Anuria quickly followed. The granular sensation felt while the ureteral catheters were being passed gave evidence of the presence of crystals in the ureters, and examination of the urine revealed typical crystals of acetyl sulfathiazole. If one assumes that the catheters were patulous, the inability of the kidney to excrete urine or indigo carmine through these catheters indicates a damage or block within the kidney itself and not in the extrarenal passages. Peterson and Finland²⁰ reported a case in which crystals formed in the ureteral catheters during catheterization, causing complete obstruction to the urine outflow. When intrarenal obstruction or damage has taken place, ureteral catheterization and irrigation of the ureters

and pelves cannot be expected to relieve the anuric patient. Such a procedure will, however, clear the extrarenal passages and will allow free flow of urine when diuresis begins. Carroll, Shea and Pike²¹ have shown that sulfathiazole crystals dissolve best in distilled water at 107 F. Warm distilled water would probably have been superior to the warm physiologic solution of sodium chloride used in this patient. Dourmashkin and Worton²² stated, in regard to sulfapyridine urolithiasis, that timely ureteral catheterization may be life saving. This is true only if there is little intrarenal obstruction and not when intrarenal blockage is primary. The latter must be treated by forcing fluids, sodium bicarbonate and diuretics.

At necropsy the kidneys of this patient were not pale, swollen or filled with sulfathiazole crystals as were the kidneys of the previous patient, who showed evidence of acute sulfathiazole injury. Instead, these kidneys were those of subacute damage in which injury had been inflicted more than twenty-one days previous to her death. It is possible that during these twenty-one days any crystals that may have been present were dissolved and excreted.

CASE 4—E. B., a Negro woman aged 32, married, a housewife, entered Charity Hospital on Sept. 22, 1941 complaining of a cough of fourteen days' duration. She was discharged on October 22.

On September 8 she noted a dry cough, headache, slight fever and pain in the chest, which were followed by definite clinical evidence of lobar pneumonia.

There were moderate anemia and leukocytosis. The urine had a specific gravity of 1.014, 2 plus albumin and occasional pus cells and erythrocytes.

On September 22 sulfathiazole was started by giving 2 Gm immediately, 2 Gm in four hours and 1 Gm every four hours orally thereafter. No sodium bicarbonate was given. A soft, neutral diet was supplied. On September 25, after receiving 16 Gm of the drug, she complained of a constant, dull, bilateral backache and an inability to urinate for twelve hours. Twenty cc of bloody urine loaded with sulfathiazole crystals was obtained by urethral catheterization. The flat plate of the abdomen at this time showed no evidence of radiopaque urinary calculi. Ureteral catheters were passed and a gritty sensation was noted as the catheters were guided into the pelvis of the kidneys. Five cc of bloody, granular urine was drained from each pelvis. The pelvis were irrigated with warm isotonic solution of sodium chloride until no more crystals were obtained. Intravenous indigo carmine appeared in weak concentration in both catheters at the end of thirty minutes. The blood urea nitrogen was 28 mg per hundred cubic centimeters, the carbon dioxide combining power 58 volumes per cent and the blood sulfathiazole 107 mg per hundred cubic centimeters. The patient was treated with 3,500 cc of fluid daily, an alkaline-ash diet, 40 Gm of sodium bicarbonate daily and irrigation through the ureteral catheters every two hours for seven days. On September 26 the urine output was only 25 cc. The output during the next four days was 470, 410, 835 and 2,025 cc respectively. By the time of her discharge on October 20 there were no erythrocytes in the urine. The urea clearance was 100 per cent and the phenolsulfonphthalein excretion 70 per cent in the first hour and 5 per cent in the second. The blood urea nitrogen was 8 mg per hundred cubic centimeters.

The course in this case resembled that of the previous one in that headache, intrarenal suppression of urine, hematuria, crystalluria and azotemia developed after

the oral administration of the drug. In contrast to the previous patient, however, she received only 16 Gm of the drug in three days. The blood sulfathiazole level was not excessive. Following alkalization, ureteral catheterization and diuresis, recovery took place in five days. The criteria for recovery used in this case was the absence of hematuria, a return to a normal urine output and the existence of normal renal function. The problem of the administration of sulfathiazole to a patient with evidence of a preexisting renal lesion is presented by this patient. Before sulfathiazole was given a routine urine examination showed 2 plus albumin and an occasional erythrocyte. This may have been secondary to her pneumonia, as she had no history or other signs of nephritis. Sadusk, Blake and Seymour²³ stated that persons with heart failure or renal damage retained the drug with a subsequent high blood level and a high degree of acetylation which was probably the result of continuous recirculation through the liver. It would seem then that any condition which would increase the acetylation and hence augment the insolubility of sulfathiazole would be a contraindication to the use of the drug. The renal function was not sufficiently impaired, even if there was previous renal disease, to produce an accumulation of sulfathiazole in the blood, as the blood level was only 107 mg. per hundred cubic centimeters. On discharge the patient showed no evidence of impairment of renal function. The urea clearance test, blood urea nitrogen level and phenolsulfonphthalein excretion tests were within normal range. Before catheterization the patient showed negative roentgenograms of the kidney regions. A few moments later, however, a gritty sensation was felt as the ureteral catheters were guided into place. These crystals were not roentgenographically visible. Uroliths of sulfathiazole are invisible unless infiltrated with calcium, in which case they can be seen by x-ray examination. This patient illustrates the success that usually follows treatment of the renal damage.

CASE 5—R. B., a white man aged 54, married, entered Charity Hospital on Sept. 6, 1941 with the complaint of inability to urinate of thirty-six hours' duration. He was discharged on September 24.

Fourteen days previous to entrance he developed a cough, sore throat and general malaise, which was accompanied by painful joints, chills and fever. His symptoms continued for ten days, at which time he received 8 Gm of sulfathiazole over a period of forty-eight hours. This was unaccompanied by sodium bicarbonate. After the first dose of the drug he became nauseated, and during the course of the treatment he vomited frequently. For two days prior to entrance he noted a gradual diminution of his urinary output, and for the thirty-six hours previous to entry he had passed no urine. At no time had he noted dysuria, hematuria or backache.

Physical examination failed to show any abnormalities except a temperature of 102 F. There were mild anemia and no leukocytosis. The nonprotein nitrogen was 86 mg per hundred cubic centimeters and the carbon dioxide combining power was 29 volumes per cent. A blood sulfathiazole value was not reported. No urine was obtained by ureteral catheterization. X-ray examination of the kidney showed no evidence of calculi formation.

On September 6 cystoscopy was done and a ureteral catheter was passed into the left kidney pelvis. Two cc of cloudy urine was obtained, which contained many epithelial cells, no crystals and no red cells. There was no further excretion of

urine in thirty minutes. The catheter could not be passed into the right pelvis. The patient was returned to the ward with the catheter in place. For the following seven days he was given large doses of 50 per cent dextrose, theophylline with ethylenediamine and fluids intravenously, caffeine with sodium benzoate intramuscularly and sodium bicarbonate and digitalis orally. The ureteral catheter was irrigated frequently with warm isotonic solution of sodium chloride. The catheter was removed on September 13, at which time the blood sulfathiazole was 1.0 mg. per hundred cubic centimeters. The blood urea nitrogen was 39 mg. per hundred cubic centimeters and the urine flow adequate. On September 19 the blood urea nitrogen was 22 mg. per hundred cubic centimeters and the phenolsulfonphthalein excretion was 30 per cent in the first hour and 20 per cent in the second hour. On September 24, the day of his discharge, the excretion was 25 per cent and 17 per cent in the first and second hours respectively.

The patient received only 8 Gm. of sulfathiazole in two days, after which he was anuric for thirty-six hours. His blood urea nitrogen was high and he was clinically uremic. Following ureteral catheterization only a few drops of urine could be obtained from the left kidney pelvis. It is remarkable that no erythrocytes or crystals were found in the urine, and at no time was gross or microscopic hematuria seen. An intensive regimen of diuresis was instigated, and the patient was discharged in fifteen days with evidence of moderate renal impairment. In view of the small dosage received, the symptoms might be due to overdosage, idiosyncrasy, sensitivity or hyperacetylation of the drug. In general, symptoms of overdosage are certain, reproducible and reversible; they can be produced in the experimental animal, and the severity of the reactions is dependent upon the dosage of the drug employed.²⁴ The dose employed in this case is certainly not excessive for the average patient. Symptoms due to idiosyncrasy are uncertain, are variable, have little relation to dosage and have no counterpart in the experimental animal.²⁴ Symptoms due to sensitivity are characterized by a previous history of contact, a period of incubation and an altered and accelerated response. The patient had not taken sulfathiazole previously. Although it is generally conceded that the sulfonamides produce no allergic antibodies such as precipitins and that the scratch, intradermal and passive transfer tests are generally negative, there are, however, at least a dozen reports in the literature which seem to indicate an allergic reaction to the sulfonamides in persons who have been previously sensitized to these drugs.²⁵

CASE 6.—B. G., a Negro aged 35, married, a longshoreman, entered Charity Hospital on Feb. 10, 1941 complaining of cough and chest pain of four days' duration. He was discharged on February 21.

Four days before admission the patient contracted an infection of the upper respiratory tract. On admission his temperature was 100 F. and there were coarse, dry rales in the lungs. The blood and urine were normal.

On February 11, sulfathiazole was started orally without sodium bicarbonate. Nine Gm. of the drug was given in thirty-two hours. The patient became nauseated. A voided urine sample was grossly bloody. Numerous needle shaped crystals were seen microscopically. Fluids were forced and sodium bicarbonate was given. By the seventh day of treatment, no more erythrocytes could be found in the urine. He was discharged on February 21.

This case superficially resembled case 5 in that a small dose of sulfathiazole was administered to a comparatively young person whose urinary findings were normal previous to the administration of the drug. The presenting symptom was hematuria; oliguria did not occur. The urine was loaded with the typical dumb-bell shaped rosettes and large orthorhombic and hemimorphic crystals, which are described in detail by Sunderman, Pepper and Benditt.²⁵ Many patients receiving sulfathiazole have crystals in the urine and yet show no sign of renal damage. Schwartz and his collaborators¹⁸ have shown that of 100 patients receiving sulfathiazole, half having alkaline and half acid urine, 28 per cent of the former and 70 per cent of the latter had crystalluria. The mere presence of crystals in the urine is not an indication to stop the drug. The patient responded to the simplest kind of treatment. Probably only extrarenal irritation, which cleared readily with the withdrawal of the drug, had taken place.

COMMENT

The 6 cases reported illustrate some of the renal problems encountered from the therapeutic use of sulfathiazole. Such renal injury has been noted more for sulfapyridine than for sulfathiazole.²⁰ This is most probably due to the fact that the latter drug has been used for only a relatively short time. It is too early to evaluate the status of sulfadiazine and sulfaguanidine as far as renal damage is concerned. Sulfanilamide appears to be much less likely to injure the kidneys seriously.²⁰ These individual differences among the sulfonamides can be explained in part, at least, by their known chemical and pharmacologic behavior. Sulfathiazole is rapidly and irregularly absorbed from the gastrointestinal tract, it produces variable blood levels, acetylation is limited, it is excreted rapidly in the urine, and its reabsorption from the tubules is poor because of its relative insolubility in urine. Sadusk, Blake and Seymour²³ showed that the rate of absorption in a normal adult male following a single oral dose of 4.2 Gm. (0.06 Gm. per kilogram) reached its peak of 9 mg. per hundred cubic centimeters in the blood three hours after ingestion. They also pointed out that the kidneys at autopsy contained more sulfathiazole than did the other organs of the body. In six hours the blood sulfathiazole level had fallen considerably. Forty per cent of the drug was excreted in the urine in six hours, and 70 to 80 per cent was excreted in twenty-four hours. In cases of pneumococcic pneumonia a single dose of 4 Gm. of sulfathiazole raised the blood sulfathiazole level to 4.9 mg. per hundred cubic centimeters within four hours. This ready absorbability of the drug was comparable to that found with sulfanilamide. When 32 patients without either heart disease or nephritis were treated with an initial oral dose of 4 Gm. of sulfathiazole and subsequent doses of 1 Gm. every four hours, the blood sulfathiazole level varied between 2 and 12 mg. per hundred cubic centimeters.²³ This variability of blood sulfathiazole was somewhat less by the tenth day. The rapid absorption of the drug in human beings makes it necessary to start with an initial dose of about 4 Gm. and to administer the drug at intervals of four hours day and night. With its variability of absorption, even in the presence of a normal excretory rate, it is necessary to examine the blood sulfathiazole level at regular intervals in order to control properly the progress of the patient. Carroll,

Kappel and Lewis²⁶ have stressed the value of blood sulfathiazole levels in controlling the pharmacologic and toxic effects of the drug. They feel that a blood sulfathiazole level of 5.0 mg. per hundred cubic centimeters is both safe and effective. This was demonstrated by a study of 200 benefited patients who showed no hematuria or oliguria. Wagoner and Hunting⁴ found sulfathiazole and sulfapyridine equally effective when administered to pneumonia patients for five days, keeping the blood sulfathiazole level between 4 and 6 mg. per hundred cubic centimeters. Rammelkamp and Stoneburner²⁷ concluded from their experiments in vivo and in vitro that 2 to 4 Gm. of sulfathiazole daily was sufficient to sterilize the urine of patients with mild urinary tract infection. Such a small dose as this may be highly desirable in treating patients with renal infection with a drug which itself may cause renal damage. Culp⁶ felt that large doses of sulfathiazole predisposed to renal complications. Carroll, Kappel and Lewis,²⁶ however, described a case in which 14 Gm. of sulfathiazole was administered daily without harmful effects. Oral doses of approximately 0.06 Gm. per kilogram have been used effectively against types I, II and III pneumococcus, beta Streptococcus hemolyticus group A, gonococcus and Staphylococcus aureus.

Sodium sulfathiazole in contrast to sulfathiazole is poorly absorbed from the gastrointestinal tract and rectum. Strauss, Lowell, Taylor and Finland²⁸ showed that, when sodium sulfathiazole was administered intravenously, a high blood level was attained as compared with the sodium salts of the other sulfonamides. The drug was excreted rapidly and almost quantitatively. Both sulfathiazole and its sodium salt were reabsorbed poorly by the renal tubules.

The degree of acetylation, which probably takes place to some extent in the liver, would seem to have some bearing on urolith formation for the acetyl form is highly insoluble. Sadusk, Blake and Seymour²³ have shown that the degree of acetylation of sulfathiazole is comparatively slight and variable. It ranges from 0 to 30 per cent, the median being 12 per cent. In patients with congestive heart failure and renal damage the blood sulfathiazole level following average doses may rise to 15.9 mg. per hundred cubic centimeters by the fourth day with a high degree of acetylation. This has been said to be due to the prolonged recirculation of the drug through the liver.

DIAGNOSIS

The diagnosis of renal damage is not difficult, especially if the patient has been properly studied and an inventory of the renal state has been taken before sulfathiazole was administered. The appearance of hematuria, oliguria, backache, tenderness over one or both kidney areas, decreased renal function, azotemia and progressive nephromegaly in a patient who has received sulfathiazole should make one suspect renal damage from the drug. Rarely do all the findings exist at the same time. Cystoscopic study will usually establish the diagnosis. Sulfathiazole crystals in the urine

may aid in establishing the diagnosis, but their presence alone does not mean renal damage. X-ray study will usually not reveal uroliths unless there is calcification, which is rare. It should be remembered that renal damage can occur in the presence of a low blood level of sulfathiazole and also after only a small amount of the drug has been administered.

PREVENTION

Because of the tendency of sulfathiazole to injure the kidneys, it is necessary to employ the drug cautiously. On administration of the drug, it is advisable to follow certain rules:

1. Determine whether or not the patient has had any sulfonamide medication before. If the history is not reliable, it is advisable to determine the blood level and prescribe accordingly. This will tend to prevent overdosage and reduce the likelihood of injuring the kidneys.

2. Evaluate the state of the patient's renal function and the nature of the urine being excreted before administering the drug. In the presence of impaired renal function there is a greater chance for overdosage and renal damage. Furthermore, infectious states for which the drug is used will in themselves produce renal changes with casts, erythrocytes and albumin in the urine. It is therefore necessary to know whether or not findings in the urine following the use of sulfathiazole are due to the drug or to previously existing infection. In the presence of serious renal damage proceed carefully with the drug, check the urine frequently and determine the blood sulfathiazole level often. Should hematuria develop or renal function definitely decline, stop the drug immediately. Do not allow the blood levels of the drug to increase above accepted therapeutic values. In some instances it might be well to determine the blood levels of urea nitrogen or total nonprotein nitrogen before giving sulfathiazole to patients who have some evidences of impaired renal function determined by urea clearances, concentration tests and the like. Such determinations will aid in supporting other findings in the future, especially if renal complications are suspected. Palpate for the kidneys before and during the use of the drug. As shown in the first case, the kidneys may become palpable once renal injury has occurred.

3. The hydration of the patient should be evaluated. A severely dehydrated patient will take in a great deal of fluid and excrete but little and therefore will be more likely to experience renal damage. Chart the fluid intake and output and make sure that the urine output is of good volume before and during the use of the drug. Curtis and Sobin¹⁷ have shown that 2,000 cc. of urine output daily are necessary to prevent the formation of acetyl sulfapyridine crystals in acid urine of low specific gravity for a 2 Gm. daily intake and that 6,000 cc. is necessary for a 6 Gm. daily intake. On the other hand, with an alkaline urine 1,250 cc. and 3,750 cc. of urine output daily would be necessary for doses of 2 and 6 Gm. daily intake respectively. Once oliguria develops in spite of a large fluid intake, the drug should be stopped.

4. There is some disagreement among observers as to the influence of the pH of the urine on the incidence of renal damage, as we have shown. Since some believe that an alkaline urine tends to reduce crystal forma-

tion,²⁹ and if the use of alkalis and an alkaline urine are not contraindicated in a particular case. It would be well to administer alkalis and maintain an alkaline urine.

5. There is some evidence to indicate the development of hypersensitivity to the sulfonamides.³⁰ It is well, therefore, to be extremely cautious and particularly vigilant in the treatment of patients who already suffer from a form of allergy. Patients who have recently received a sulfonamide drug may have been sensitized to such drugs and will react allergically if given another course of one of them.²⁵ It is better, if there is no need for haste, to give these two types of patients about $\frac{1}{2}$ Gm. of the drug by mouth and wait twelve hours. If no unfavorable reactions result, proceed with the treatment. Such a procedure should also be employed, if possible, in all cases so as to eliminate unpredictable severe reactions that occur because of idiosyncrasy to sulfonamides.

TREATMENT

The drug should be stopped immediately, once the slightest evidence of kidney damage is discovered. Fluids should be administered in large quantities, as described. Ureteral catheterization should be done promptly and the catheter should be allowed to remain in place until a normal volume of urine flow is reestablished. The pelvis should be irrigated at two hour intervals with warm (107 F.) distilled water. This procedure is effectual in relieving extrarenal obstruction; an intense diuretic regimen is necessary to relieve intratubular renal obstruction.

The diuretics should be large quantities of fluid and, if necessary, hypertonic solutions of dextrose. Avoid, if possible, the use of magnesium sulfate, as it has been suggested by some that it predisposes to the formation of sulfhemoglobin; but it may be used intravenously if there is no cyanosis and if the oliguria persists after other measures for diuresis have failed. Mercury and acid diuretics should not be used. The patient should be placed on an alkaline ash diet and the urine kept alkaline with the use of sodium bicarbonate.¹⁷ The protein intake should be restricted for four or five days or during the period of severe oliguria, hematuria and azotemia. Fluids should be administered in large quantities for many days after the kidneys have returned to normal.

These patients should be followed and carefully studied from time to time to make sure that there is no residual or latent damage which may become manifest as a chronic disease later. It is not known how complete and permanent the recovery is.

CONCLUSION

To reduce the incidence of renal damage, certain rules should be followed:

- (a) Check previous sulfonamide medication in order to prevent overdosage.
- (b) Evaluate the state of the renal function before the drug is administered and proceed accordingly.
- (c) Evaluate the state of hydration of the patient in order to insure a large volume of urine.
- (d) It is preferable to maintain an alkaline urine during the administration of sulfathiazole.

(e) Guard against allergy, hypersensitivity and idiosyncrasy.

Progressive oliguria, impairment of renal function, azotemia, hematuria, backache or nephromegaly should be indications for discontinuing the drug. The presence of crystalluria alone is no such indication.

Treatment consists of alkalization, diuresis and ureteral catheterization and irrigations with warm (107 F.) distilled water.

PERIPHERAL ARTERIOSCLEROSIS IN THE DIABETIC AND THE NONDIABETIC

A STUDY OF ONE HUNDRED AND SIX
AMPUTATED LEGS

JAMES R. LISA, M.D.

MORTON MAGIDAY, M.D.

AND

JAMES FINLAY HART, M.D.

NEW YORK

It has been repeatedly stated that peripheral arteriosclerosis occurring in diabetic patients differs from that of the nondiabetic. This has aroused considerable controversy and has given rise to many differences of opinion. In view of this we have compared the vascular system in the amputated legs of the diabetic and the nondiabetic patients operated on at the New York City Hospital, Welfare Island, between Jan. 1, 1930 and Dec. 31, 1940. Our findings indicate that the type of arteriosclerosis is similar in the two groups. The only difference as we found it lay in the changes seen in the veins.

Our series consisted of 106 patients, of whom 55 were diabetic and 51 were nondiabetic. There were 109 operations, 56 among the diabetic and 53 among the nondiabetic. In each instance the operation was performed at the level of the thigh.

The vascular tree was dissected from the site of amputation as far down toward the toes as possible. A careful description of the gross appearance was made. Sections were taken from the popliteal, anterior tibial, posterior tibial and dorsalis pedis arteries with the accompanying veins, small vessels and the surrounding soft tissues. In the majority of instances two or more levels of the same artery were studied. In some cases the dorsalis pedis was not sectioned. In several instances portions of the femoral, peroneal and the interosseus arteries were included in addition to the usual sections.

As a routine stain hematoxylin and eosin was used and in the majority, in addition, a modified Weigert elastic stain was employed.

In our series the white patients predominated. There were 95 of the white race and 11 of the Negro. In the 95 white patients we found 49 diabetic and 46 nondiabetic. Of the 106 patients there were 70 men and 36 women. Among the men we found 27 diabetic and 45 nondiabetic, while among the women there were 28 diabetic and 8 nondiabetic.

The relationship between the age incidence, the sex and the color was the same among the diabetic and the

Read before the Clinical Society of the New York Polyclinical Medical School and Hospital at the stated meeting on Oct. 6, 1941.

nondiabetic. The average age of the diabetic was 65.5 years for the men and 65 for the women. In the male group the white patients had an average age of 65.3 years; the only Negro was 74. Among the women the average age of the whole group was 65.2 years. All the Negroes, 5 in number, fell into the seventh decade with an average age of 64 years. The youngest person in all the groups was a white man aged 44. The oldest was in the ninth decade and was a white man aged 82. There were 33 of the 55 patients between 60 and 69 years of age. Seven were younger and 15 were beyond the seventh decade. Among the nondiabetic the men averaged 68.1 and the women 67 years. The white men had an average age of 67.1 and the women of 67 years. There were only 4 Negroes, and they averaged 75.5 years and there was only one Negro woman, who was 65. The youngest person in the nondiabetic group was a white man aged 48 and the oldest was a white man aged 86. The majority of cases fell into the seventh and eighth decades, in which there were 20 and 19 respectively. The Negroes, of whom there were only 4, were all over 70 years of age. The white women, 7 in number, were also in the seventh and eighth decades.

Judging by the histories there was but little difference in the type of onset between the diabetic and the nondiabetic. We found notations relating to the onset in 105 of the 109 cases. There were four clinical types apparent: traumatic, infectious, trophic and insidious. In the 54 diabetic patients in this group we found 16 with a definite history of trauma as a precipitating factor. There were 3 with histories of frank infection; 8 were associated with trophic changes and 27 with an insidious onset. In the nondiabetic patients there were 13 with a history of trauma, 1 with a frank infection, 9 associated with trophic changes and 29 in whom the onset came on insidiously.

Mortality rates likewise varied little in the two groups. Up to the generally accepted forty-eight hour period for postoperative deaths there was a mortality of 6, or 11 per cent, in the diabetic and 5, or 10 per cent, in the nondiabetic. During the next eight days there were 8, or 15 per cent, diabetic deaths and 12, or 23 per cent, among the nondiabetic. From the tenth to the thirtieth day there were 13, or 23 per cent, who died in the first group and 7, or 14 per cent, in the second. The tabulation was carried out to the sixtieth day, and in the second thirty days 5, or 9 per cent, of the diabetic, and 6, or 12 per cent, of the nondiabetic died. The sixty day total, therefore, for the diabetic was 32 deaths, while that for the nondiabetic was 27.

PATHOLOGIC FINDINGS

The pathologic changes in the arteries were similar in the diabetic and the nondiabetic. In fact we were unable to distinguish one type from the other without the aid of a history. To prove this to our satisfaction we examined, at several periods of our study, the individual slides after all marks of identification had been obscured. Without exception every attempt to classify the specimens as diabetic or nondiabetic failed. Hence because we were unable to group the changes as diabetic or nondiabetic we are presenting our findings without regard to this classification.

Because the amputated legs contained no elastic arteries, we are limiting our discussion to the muscular

arteries and the arterioles. We noted in our studies of the muscular branches that sclerotic changes were consistently present and were extensive as a rule. It was also noted that the media was the coat that bore the brunt of the sclerosis. Calcification was found in all but 6 cases. When it was well defined the deposit was largely in the media. In the early stages or in cases in which the deposit was light it was invariably found at the internal elastic lamina first and is then built up toward and into the media.

Fibrosis was universal and in the majority of cases was severe. It was practically always accompanied by inflammatory reaction and organization with granulation. The latter was frequently seen to progress to bone formation, when spicules of lamellar bone and bone marrow of fatty or fibrous nature were found. Functioning bone marrow with hemopoiesis was seen seven times, four times among the diabetic and three times among the nondiabetic. The six heretofore mentioned as being free from calcification likewise showed slight or minimal atherofibrosis.

Changes in the intima of the muscular branches were just as frequent and severe as in the media but of a different nature. Atheromatous deposits were in direct relationship to the caliber of the artery. The larger the vessel, the more the liability to atheromatous deposits in the intima. It was found that the popliteal artery presented such deposits frequently, the tibial arteries less frequently and the dorsalis pedis only infrequently. In the few instances in which the change was present in the dorsalis pedis the deposit was extremely heavy in the larger arteries. As a rule the changes in the smaller arteries were characterized by an intimal fibromatous deposit.

Arteriolar sclerosis, the type generally stated to occur in the arterioles and the fine twigs of the arterial tree, was recognized frequently enough to be a positive finding although not a universal one. Its presence or degree of involvement was in no manner related to the changes found in the muscular arteries. Hence it has become our strong conviction that the changes occurring in the arterioles were independent of those in the muscular branches.

In the veins, however, conditions were different. Acute venous thrombosis of the larger radicles was found less frequently among the diabetic than among the nondiabetic. This was found nine times in the former and nineteen times in the latter. Venous changes of a chronic nature such as are seen in phleboscrosis were also less frequent in the diabetic. They were found in 11 of the diabetic and in 22 of the nondiabetic patients. Occasionally these changes had progressed to calcium deposits in the walls, but this was not a common finding.

Lymphangitis was almost invariably found where infection was present regardless of the presence or absence of diabetes. Pathologic changes in the nerves were never demonstrated in either group.

DRY GANGRENE

Dry gangrene occurred in 7 of the diabetic legs. In these cases the gangrene began as a dry process and remained so during the entire course. In the nondiabetic, dry gangrene with a similar progress was found

11 times. Cases in which the gangrene began as a dry affair and later became infected and developed cellulitis were 9 in number in the diabetic and 17 in the nondiabetic. In other words the first evidence of arterial occlusion with mummifying gangrene was present in 16 of the diabetic and 28 of the nondiabetic patients. The nondiabetic with a gangrene originally dry often developed a subsequent cellulitis. Such a development was found to occur twice as frequently in the nondiabetic as in the diabetic.

WET GANGRENE

Moist gangrene occurred in 32 of the diabetic cases and in only 20 of the nondiabetic. But few cases in either group developed a dry gangrene after the onset of the moist stage. There were 5 among the diabetic and only 2 among the nondiabetic, however, that came into this group. In the entire series 46 of the diabetic were associated with cellulitis at some time or another. Among the nondiabetic the total was slightly lower, 39 having a cellulitis at some period.

COMMENT

Joslin¹ and Wilder² believe that four types of arteriosclerosis can be distinguished: atherosclerosis, arteriolar sclerosis, Mönckeberg's sclerosis and senile sclerosis. Our data on atherosclerosis in this study are limited to its manifestations present in the legs. We can say, however, that this form of arterial change was frequently found in the larger muscular arteries such as the popliteal, with a diminishing occurrence as the branches got smaller. We also recognized arteriolar sclerosis in some of our cases. We feel, however, that we cannot accept Mönckeberg's or senile sclerosis as clearcut subdivisions. It seems to us there is no one type of arteriosclerosis that can be called by either of these terms. Likewise we feel that the changes in the arteries of the legs so frequently are a combination of atherosclerosis and the so-called Mönckeberg's sclerosis that the generic term of arteriosclerosis might be more applicable.³

Atherosclerosis, according to Joslin, is the characteristic vascular lesion among the diabetic. He accepts the fact that all types of arteriosclerosis are found in the legs of the diabetic with atherosclerosis predominating. He states that, in the legs removed from diabetic patients, he found a marked intimal involvement of the muscular arteries consisting of a heaping up of the intima with deposition of fatty material in which many cholesterol crystals were seen. He emphasizes the fact that atherosclerosis, supposed to be found only in the elastic type of arteries in the nondiabetic, is of common occurrence in the muscular arteries of the legs of diabetic patients. Wilder accepts the importance of atherosclerosis in the diabetic. He differs from Joslin, however, by saying that atherosclerosis may be found in the smaller muscular arteries of the nondiabetic. He feels that the frequency of atherosclerosis is not unusual in the arteries of the diabetic but the intensity of the process and the incidence of severe grades in the arteries of the heart and the legs are significantly greater in the diabetic than in the nondiabetic. He looks favorably on

the evidence of Warren⁴ that long duration of diabetes is attended with more progression of atherosclerosis in the heart and legs than can be due to aging but says that many patients with diabetes of long duration present no more atheroma at autopsy than the nondiabetic of the same age.

We cannot agree with either Joslin or Wilder that atherosclerosis is the predominating form of arterial change in diabetic gangrene of the extremities. Nor can we agree with Joslin that it is not found in the muscular arteries of the leg in the cases of nondiabetic gangrene. Furthermore, we cannot accept the statement of Warren that the extent of the atheromatous change is in direct relation to the duration of the diabetes. Our feeling is that in a percentage of diabetic patients atheromatosis predominates but that in an equal percentage of the nondiabetic the same condition is found. Our studies show us that atherosclerosis may be mild or severe in either type of gangrene. When it is severe it is marked by extensive plaques in the large arteries and lesser deposits in the smaller branches. It is only in these severe cases that the dorsalis pedis artery becomes involved. Severe atherosclerosis therefore not only presents more involvement of the elastic arteries but extends peripherally toward the smaller arteries. This, we will repeat, is true for both types of gangrene.

Arteriolar sclerosis is generally accepted as a well defined lesion that may be found, among other places, in the finer twigs of the arteries of the legs. Root and Sharkey⁵ of the Joslin Clinic, after a study of 175 autopsies with 48 instances of diabetic gangrene of an extremity, reported that atherosclerosis is the rule in these cases and that hypertension appears to accentuate the process. They describe an intimal lesion with hyaline thickening and obliteration of the lumen. Wilder feels differently about the situation, saying that arteriolar sclerosis is no more frequent in the diabetic than in the nondiabetic. Though accepting the presence of arteriolar sclerosis in the extremities of the diabetic, he emphasizes the occurrence of medial hypertrophy, stating that it may be associated with atheromatous processes of the intima. We found arteriolar sclerosis in both types. It was the medial hypertrophy described by Wilder. However, we did not find the atheromatous changes associated with the medial hypertrophy. Nor did we find the extensive atheromatous process described by Root and Sharkey. Very rarely there was present calcification of the media close to the internal elastica. This was the closest approximation to so-called Mönckeberg's sclerosis of the larger muscular arteries that we encountered. Excluding any vascular lesions that might have been present in the kidney, the medial hypertrophy of the arterioles of the legs bore no relationship to the presence or absence of hypertension. Likewise it did not seem to bear any resemblance to occlusive disease of the large arteries in the immediate neighborhood.

Mönckeberg's sclerosis does not seem to us to be, in the legs at least, sufficiently cleancut to be considered an entity. Classification of this type of arterial change therefore is difficult, and a comparison of its occurrence in diabetic and nondiabetic patients is of questionable value. We have the feeling that if it is to be considered

1. Joslin, E. P.: *The Treatment of Diabetes Mellitus*, ed 7, Philadelphia, Lea & Febiger, 1940.

2. Wilder, R. M.: *Clinical Diabetes Mellitus and Hyperinsulinism*, Philadelphia, W. B. Saunders Company, 1940.

3. MacCallum, W. G.: *Textbook of Pathology*, ed 6, Philadelphia, W. B. Saunders Company, 1936.

4. Warren, Shields: *Pathology of Diabetes Mellitus*, ed. 2, Philadelphia, Lea & Febiger, 1938.

5. Root, H. F., and Sharkey, T. P.: *New England J. Med.* 215: 605 (Oct. 1) 1936.

at all it must be looked on simply as a manifestation of atherosclerosis. According to Joslin it is a patchy involvement of the media without the accumulation of lipid. He brings out the point that it occurs together with atherosclerosis and in such close relation that it suggests strongly that they are the same process. Wilder agrees that it is patchy, goes on to necrosis and calcification and lacks lipid deposits. He believes that it involves the legs by predilection. Like Joslin he considers that the primary seat is in the media and that it well may be a part of the same process as atherosclerosis. We accept the presence of a condition generally called Mönckeberg's sclerosis but we feel that the process is an arteriosclerosis whose character is determined by the anatomic structure of the arteries in which it is found. MacCallum has stated that one may well expect the manifestations of arteriosclerosis to be different in different portions of a system varying so greatly in its anatomic structure. However, as far as we were able to identify it in the specimens concerned in our studies we were unable to note any difference in its presence in either the diabetic or the nondiabetic.

Senile sclerosis likewise seems to us to be a misnomer. Let us consider Joslin's conception of this subdivision of arteriosclerosis. He accepts it as a diffuse fibrosis causing a change in the elastic tissue with a loss of elasticity and degeneration. Wilder, who also uses this term in his classification, considers it a diffuse change consisting of progressive deterioration with splitting of the internal elastic membrane and formation of new fibrous tissue. We can take no issue with these findings but we cannot accept that these changes are of a senile nature. We feel that this is not positively a condition of old age, as it is found occasionally in childhood, frequently in the third decade, and may be practically absent in the eighties and nineties.

Combinations of the various types of arteriosclerosis are frequently found. This naturally leads to great difficulties in arriving at clearcut conceptions of the various subdivisions and often makes it difficult to determine the type present in the individual case. Joslin states that any or all varieties may be associated with the so-called senile type. He also says that Mönckeberg's sclerosis and atherosclerosis are a very common coincidence. Wilder notices the same combinations. We found the different types of arteriosclerosis occurring in various combinations. There was, however, no difference in the combinations found in the diabetic and the nondiabetic specimens.

Occlusion of the lumen of the artery is the serious development in arteriosclerosis. It is generally accepted today that such occlusions can be attributed mainly to atherosclerosis with a rare incidence due to Mönckeberg's sclerosis. The other types are not held responsible for any part in this phenomenon. Ordinarily the process develops slowly, but it may be found at times to advance rapidly. The time element may not be the sole factor, as some cases appear to occur with a rapid tempo. As the atheromatous process progresses there is a tendency for degenerative changes to occur in the endothelium. This degeneration is the prelude to arterial thrombosis. A second process can occur. Instead of thrombosis there may be ulceration with a discharge of the underlying atheromatous deposit into the blood stream.

In our study we found an equal number of diabetic and nondiabetic patients with gangrene from occlusion. In view of the fact that the diabetic incidence in the general populace is about 1 per cent, our finding of an equal number in each group coming to amputation suggests strongly that peripheral occlusive disease is many times more frequent in the diabetic.

Both acute and chronic changes were more frequent in the veins of the nondiabetic. This may be accidental, but it does suggest that the condition of the veins may have a definite bearing on the more frequent occurrence of venous occlusion in the nondiabetic.

It is commonly stated that diabetic gangrene is usually moist and nondiabetic gangrene dry. To this we cannot agree. We found that almost two thirds of the nondiabetic specimens were complicated at some time with cellulitis, with but a slightly larger number of diabetic patients similarly involved. Again early and extensive cellulitis was not uncommon in the nondiabetic, although it was somewhat more frequent in the diabetic.

Since these findings are contrary to those of most investigators, several questions arise: 1. Does the phlebosclerosis which we found more frequently in the nondiabetic play a role in the increased incidence of infection? 2. Are there metabolic tissue changes in the diabetic which are the deciding factors in the absence of phlebosclerosis? 3. Is the term "wet gangrene" too loose and would the use of more rigid criteria help to differentiate the conditions found in the presence of infection?

With regard to the phlebosclerosis, our findings are suggestive that it may play a role; but no dogmatic statement can be made. Metabolic changes can very well be considered as possible factors, as it is well accepted that infection in any part of the body is more severe among the diabetic than among the nondiabetic. With regard to the final question, we believe that the term "gangrene" is used rather promiscuously. We feel that a more careful observation and use of terms is advisable. As Williams and O'Kane⁶ have shown in their classification, careful evaluation of the physical findings will usually distinguish between the result of occlusive disease and infection.

SUMMARY AND CONCLUSIONS

The peripheral vascular pathologic condition of 100 amputated legs was studied. There were 56 diabetic specimens and 53 nondiabetic specimens. The two types were in the same age period. The women outnumbered the men in the diabetic group. The opposite was true in the nondiabetic group. The arterial changes were similar in the two groups. Acute venous occlusions and phlebosclerosis were more frequent among the nondiabetic. Infection with cellulitis was only slightly more frequent in the diabetic group. Dry gangrene occurred almost as frequently in the diabetic as in the nondiabetic. The occlusive element in arteriosclerosis is the dangerous feature in both types. The terms dry and wet gangrene do not properly describe the conditions found. More rigid criteria and more careful differentiation between the lesions secondary to occlusive arterial disease and those due to infection should be instituted.

DOES DIABETES MELLITUS PREDISPOSE
THE PATIENT TO THE PYOGENIC
SKIN INFECTIONS?A STUDY OF THE ETIOLOGIC RELATIONSHIP
OF FURUNCULOSIS AND CARBUNCLEJOHN R. WILLIAMS, M.D.
ROCHESTER, N. Y.

There is a prevailing impression among both physicians and laymen that boils and carbuncles are commonly associated with diabetes and that the diabetic are predisposed or more likely to suffer from these pyogenic skin infections than are the nondiabetic. An examination of the literature does not support this view. The *Cumulative Index*, beginning with the year 1917 to March 1941, covering a period of more than twenty-five years, lists only seven articles dealing with carbuncle or furunculosis in association with diabetes. In each instance they are case reports and descriptions of surgical treatment. None of the standard manuals on diabetes discuss the incidence of skin infections, the text being confined to treatment. This is also true of many of the prominent manuals relating to the general practice of medicine. It may be said, therefore, that there is practically no evidence in the literature supporting the conclusion that diabetes mellitus predisposes to pyogenic skin infections. Since these infections are usually very serious as to comfort and often fatal, the subject is worthy of more careful study than it has thus far received.

In an attempt to learn how frequently furuncles and carbuncles occur both independently and in association with diabetes, a study was made of the admissions to two large general hospitals, the Strong Memorial and the Rochester General, and of the office practice of several general practitioners.

In one of these hospitals during the years 1938, 1939 and 1940 there were a total of 27,209 admissions. Of these, 330 were diabetic patients, 8 of whom were afflicted with boils or carbuncles. In the remaining 26,879 patients there were 166 instances of boils or carbuncles.

In the other large general hospital over the same period there were 43,980 admissions; 295 patients were afflicted with boils or carbuncles; of these 8 were diabetic.

Since the advent of insulin and the improvement in the general treatment of diabetes, only diabetic patients afflicted with a serious complication have sought admission to hospitals. For the most part too they are the elderly or middle aged. This is particularly true of patients with carbuncles.

In 2,130 office patients of four general practitioners, there were 89 instances of furunculosis or carbuncles. In this group there was but 1 diabetic patient who had a furuncle. From these data it is obvious that there is no significant etiologic relationship between pyogenic skin infections and diabetes.

It is important to inquire how frequently diabetic patients contract skin abscesses. In doing so it should be borne in mind that, when a person is once afflicted, diabetes becomes a permanent malady. Under the present method of treatment the diabetic apparently live on indefinitely. I have under my care several patients who

acquired diabetes before the advent of insulin. Some of these were children at its onset. They have lived fairly normal lives since; many have married and have achieved parenthood. The diabetes is not a disabling handicap. Many patients have thus gone on from five to twenty-five years. A certain number of nondiabetic persons in such a period of time would normally contract pyogenic skin infections. It follows therefore that a similar proportion of diabetic patients may be expected to become infected.

A study of 500 diabetic patients admitted to both office and hospital practice was made with reference to the incidence and occurrence of the pyogenic skin infections diagnosed as boils and carbuncles. They are classified according to sex and age in the accompanying table.

In only one instance did the onset of a boil coincide with the discovery of diabetes. In all the other cases except 1, both boils and carbuncles occurred long after the onset of diabetes and apparently as an independent and unrelated phenomenon. In the 1 case that was an exception the carbuncle occurred ten years before the onset of the diabetes.

*Occurrence of Boils and Carbuncles in Five Hundred
Cases of Diabetes*

	Cases
Young, under 21 years.....	75
Old, over 21 years.....	424
Male	240
Female	260
Boils, total occurrence in 500.....	13
Carbuncles, total occurrence in 500.....	7

Although the numbers of cases in this study are small, they support the opinion and conclusions of other workers who have examined the question. They are as follows:

1. The prevailing assumption that diabetes mellitus predisposes an individual to pyogenic skin infections is not supported by clinical investigation.

2. Pyogenic skin infections occur no more frequently in diabetic than in nondiabetic individuals.

3. Both of these complications occurred more frequently in the middle aged and elderly in whom a general breakdown was evident. It is extremely doubtful that diabetes increases the susceptibility of the diabetic appreciably to pyogenic skin infections.

388 Monroe Avenue.

Yellow Fever Surveys.—The discovery of a simple test in the mouse for the presence of immune bodies to yellow fever, and the fact that after a natural infection with yellow fever immune bodies persist for very many years—probably for the life of the individual—have enabled surveys to be undertaken for the purpose of determining the distribution of yellow fever both in space and time. Such a survey was initiated in Africa in 1933 by the International Health Division of the Rockefeller Foundation. The results of the survey in the Anglo-Egyptian Sudan, published by Hewer (1934) and by Sawyer and Whitman (1936), show that if the specificity of the test is accepted yellow fever is not confined to the West Coast of Africa, as was believed for many years, but extends eastward as far as the White Nile.—Findlay, G. M.; Kirk, Robert, and MacCallum, F. O.: Yellow Fever and the Anglo-Egyptian Sudan: Distribution of Immune Bodies to Yellow Fever, *Ann. Trop. Med.* 35:121 (Dec. 31) 1941.

FATTY DEGENERATION OF THE LIVER
IN PREGNANCYREPORT OF A CASE WITH RECOVERY: CHEMICAL
AND HISTOLOGIC STUDIES

FRANK E. WHITACRE, M.D.

AND

L. Y. FANG, M.D.

PEKING, CHINA

Acute yellow atrophy of the liver, also known as icterus gravis, acute parenchymatous hepatitis, malignant jaundice, parenchymatous degeneration of the liver or acute necrosis of the liver, is a widespread degeneration of the liver with toxic manifestations, jaundice and a reduction in the size of the liver. We prefer the term acute necrosis as more descriptive of the condition but will adhere to acute yellow atrophy, as it is so well established in the literature. It is known to occur at all ages in both sexes but is rare in pregnancy. The first case of acute yellow atrophy of the liver in pregnancy was described by Kerkring in 1706 and quoted by Williams,¹ and most writers since then have referred to the relation of the disease to pregnancy. Although very rare, it may be epidemic, as reported by Kent,² who observed 14 cases within eighteen months, all in association with pregnancy. But Kent's series lacks pathologic confirmation. In association with pregnancy, acute yellow atrophy of the liver is generally included among the toxemias of pregnancy. Typical attacks have occurred in men and in nonpregnant women, which should separate it from the toxemias of pregnancy as the term is commonly used.

Judging from the pathologic observations, there is a milder form of the disease which is variously known as acute hepatitis, toxic hepatitis and obstetric acute yellow atrophy. Hepatitis in the sense of evidence of infection is not the predominant lesion, but rather extensive fatty degeneration of the central portions of the liver lobules without actual necrosis or atrophy. Fatty degeneration of the liver seems to be a more descriptive term. The onset and the usually fatal clinical course are identical with those of true acute yellow atrophy, and the location and type of lesion, that is, fatty changes in the liver cells in these central portions of the lobules, are the same. Although the liver cells in these areas are not disintegrated, that would seem to be a matter of degree rather than of kind of disease. Until more convincing evidence is presented, we will consider this condition as an early stage of acute yellow atrophy.

INCIDENCE

The frequency of acute yellow atrophy of the liver is quoted by different authors in wide variation, but all agree that it is very rare. There is little information on the incidence of this disease in China.

In reviewing the case histories of the Department of Obstetrics and Gynecology of the Peiping Union Medical College, we found only 4 cases in the records of approximately 10,000 deliveries. Two of these cases were discarded because of insufficient evidence. One had been reported by Hsiung,³ and a report of the remaining case is now in process of publication.

From the Department of Obstetrics and Gynecology, Peiping Union Medical College.

1. Stander, H. J. Williams Obstetrics, ed. 7, New York, D. Appleton-Century Company, Inc., 1936, p. 722.

3. Hsiung, V.: Nat. M. J. China 14: 211 (Aug.) 1928.

Among 94,000 patients admitted to this hospital the diagnosis of acute yellow atrophy of the liver has been made for only 12. For 9 of these the diagnosis was made only on the clinical findings; 7 were men, and 5 were women in 4 of whom the disease was in association with pregnancy. The 3 cases in which autopsy was done appeared among the records of 3,400 autopsies.

Dr. Gordon King⁴ of Hongkong stated that acute yellow atrophy of the liver had not been observed during the past 31,113 deliveries from the year 1926 to 1940 inclusive in the department of obstetrics of the University of Hongkong.

Dr. Amos Wong⁵ of Shanghai informed us that at St. Luke's Hospital, Shanghai, acute yellow atrophy of

All the values are expressed in milligrams per hundred cubic centimeters of blood except the carbon dioxide combining power, which is in volumes per cent.

the liver had not been observed during 450 autopsies performed over a period of three years, while at the Red Cross Hospital it was observed three times in 700 autopsies over a period of thirteen years. In 1 case the disease had been in association with pregnancy. One can say only that this condition is very rare in China.

ETIOLOGY

The cause of acute yellow atrophy of the liver is still in question, and it may be that various factors work simultaneously in an individual case. The disease has been definitely associated with certain chemical poisons, for example chloroform, arsenic, phosphorus, cinchophen and carbon tetrachloride, to mention only a few.

Many theories are advanced to explain this condition. Of importance is the work of Opie,⁶ who found that

4 King, Gordon. Personal communication to the authors.

5 Wong, Amos. Personal communication to the authors.

6 Opie, E. L. J. Exper. Med. 12: 367, 1910.

the combination of chloroform and infection may produce in dogs a condition similar to acute yellow atrophy in man. Changes in the liver produced by disturbances in metabolism may explain the fact that in more than one half of the reported cases involvement has occurred during the last half of pregnancy, at a time when changes in metabolism are well known to occur. Previous damage to the liver has been suspected, and both catarrhal jaundice and cirrhosis of the liver have been accused.

The Peiping Union Medical College Hospital admits a large number of patients in the terminal stages of disease. The relative number who have pregnancy with complications is high. It is surprising that, in an area where the nutritional state of the population is low, the incidence of avitaminosis and nutritional edema is high and where previous damage to the liver, such as cirrhosis, is relatively common, acute yellow atrophy of the liver associated with pregnancy has occurred not more than five times in this hospital in twenty years. It seems probable that a single infection or toxin is not responsible but that a combination of factors in the presence of impairment of hepatic function may produce the disease.

REPORT OF CASE

A few cases of recovery from acute yellow atrophy of the liver which were based on clinical observations have been reported. The case reports of Townsend⁷ and Millar⁸ brought in the question of chloroform poisoning, the dangers of which are well established. The diagnosis in the case reported by Duncan and MacLachlan⁹ is not convincing. One case of acute yellow atrophy of the liver in pregnancy, with recovery, was described by Way¹⁰ but the diagnosis was supported only by observation of the size of the liver at operation. In a search of the literature we found no report of a case of proved acute yellow atrophy, or fatty degeneration, of the liver in association with pregnancy with recovery. We are reporting such a case, including data on two biopsies of the liver, in considerable detail, in the hope that added chemical, histologic and clinical data may finally result in a better understanding of this obscure disease. The detailed account of the stormy course, the treatment and the studies on the patient, who was admitted to our service in the early stage of the disease, is as follows:

A Chinese woman aged 30, a secundigravida and primipara, was admitted to the hospital on Jan. 30, 1941 not definitely in labor. Her expected date of confinement was February 21. She had had antepartum care in our hospital and was found to have a flat pelvis; the diagonal conjugate measured only 10 cm. The blood Wassermann and Kahn reactions were negative. Her first baby had been born spontaneously two years before, after a labor of forty-eight hours, but the baby died of convulsions three days after birth. On January 25 the patient was brought to our teaching clinic for demonstration of cephalopelvic disproportion, and at that time she complained of general weakness and loss of appetite and had eaten but little

for several days. The patient caught cold on the same day and started to have epigastric discomfort, with vomiting of coffee ground material on the following day. She gave a history of repeated vomiting of the food eaten during the course of gestation until two weeks before admission. Constipation had been present for the past three days. Jaundice was not noticed by the family members. She had been an opium addict for four months, but otherwise there was no history of taking any drug or medicine.

On admission the temperature was 37.5 C., the pulse rate 90 and the blood pressure 110 systolic and 80 diastolic. The patient was icteric, mentally dull and drowsy but conscious. She had the symptoms and signs of infection of the upper part of the respiratory tract, but the lungs were clear and the heart was normal. The spleen and the liver were not palpable, and the area of hepatic dullness was not diminished. The patient vomited several times, producing a coffee ground material; the reaction to the guaiac test was strongly positive for blood. The van den Bergh reaction was direct and immediate, and the icterus index was 20. The bilirubin content was 6.7 mg. and the carbon dioxide combining power was 28 volumes per cent. The liver, by the bromsulphalein test, showed 40 per cent retention after thirty minutes. The hemoglobin

Fig. 1.—Fatty degeneration of liver in pregnancy; liver function.

content was 14.9 Gm. and the white blood cell count was 29,400. The urine showed a trace of albumin and urobilin (1 plus) but was negative for bilirubin. Intravenous dextrose therapy was started after a sample of blood for chemical tests was obtained. (The actual amount of dextrose solution and blood transfusions administered to this patient are recorded in figure 9.)

The patient had moderate labor pains for four hours without progress, and drowsiness increased until she was in stupor. A tentative diagnosis of early acute yellow atrophy of the liver was made, and termination of the pregnancy was thought to be wise. A cesarean section was done, and, although local anesthesia was tried, the patient was uncooperative, and gas and oxygen with a little ether had to be used. The baby was apneic at birth but cried vigorously a few minutes later. The liver was found to be normal in appearance and size, and a biopsy specimen was obtained.

On January 31 the patient coughed severely. The jaundice was worse, the icterus index being 75 and the bilirubin content 11.4 mg. There was no albumin or sugar in the urine but there were bilirubin (2 plus) and tyrosine (detected by the sulfuric acid test), 1 plus; tests for leucine gave negative results. On February 1 the blood sugar level steadily rose to 280 mg. with sugar (1 plus) and acetone (3 plus) in the urine. Ten units of insulin was given, and in two hours the blood sugar fell to 26 mg. and the patient was in hypoglycemic shock, from which she recovered after the intravenous injection of a solution of dextrose. The bilirubin in the blood increased to 12.7 mg. on the same day. From February 2 to 6 the patient was steadily improving, although the violent coughing

10. Way, Stanley: Lancet 2: 934 (Oct. 28) 1939.

persisted. The blood sugar was low in spite of the repeated dextrose infusions and the patient had frequent symptoms of hypoglycemia. Insulin, 5 to 10 units, was given together with each dextrose infusion during the first few days. The jaundice improved, and the bilirubin in the blood fell to 4 mg. on

Fig. 2.—First biopsy specimen, showing central vein in the center with thin rim of normal liver cells around portal spaces; $\times 55$.

February 4. The patient developed ascites, with leakage of bile tinged ascitic fluid from the wound. The renal function, judged by the phenolsulfonphthalein test, was normal and the hippuric acid test of hepatic function repeatedly produced no precipitate. On February 7, after severe coughing, the abdomi-

Fig. 3.—First biopsy specimen, showing swollen clear liver cells and compressed sinusoids around a central vein; $\times 300$.

nal incision separated and loops of bowel were extruded. A secondary closure was done under spinal anesthesia. The liver was smaller than before and yellow tinged, and another biopsy specimen was taken. Much bile tinged ascitic fluid was removed by suction. The hippuric acid test done on that day showed 1.1 Gm. of benzoic acid. For the next few days the

patient was critically ill, the bilirubin in the blood increased and she coughed almost continuously. On February 13 the abdominal incision gaped again, a loop of intestine was found caught in the wound and there were symptoms and signs of partial intestinal obstruction. Another closure, with silver wire as the suture material, was done on the same day with the aid of spinal anesthesia. There was a moderate amount of fluid in the peritoneal cavity, and the liver was not inspected as the incision was infected. On February 14 and 18 the patient had profuse hemorrhage from the gastrointestinal tract, the discharge from the duodenal tube being bright red, and as much as 1,400 cc. of dark old blood was passed in the stools on one occasion. She was in shock several times and had to be given blood transfusions together with infusions of dextrose. After February 19 the patient gradually improved and there was no more bleeding. The jaundice disappeared, the bilirubin in the blood reaching the normal value on February 20 and the intravenous administration of dextrose was not necessary after February 23. The bromsulphalein test showed 30 per cent retention at the end of thirty minutes on February 21, 10 per cent on February 26 and a trace on March 7. The

Fig. 4.—Second biopsy specimen, showing stage of recovery with central cell occupying only about half of each lobule; $\times 55$. Compare with figure 2.

temperature and the pulse rate fluctuated according to the severe clinical course. On February 8, when the patient was in desperate condition, the temperature was 39.6 C. (104 F.) and the pulse rate 140. After this both the temperature and the pulse gradually improved until they were normal on February 20. An infection in the incision was drained, the wound healed and the patient has apparently completely recovered.

CHEMICAL ANALYSES

The clinical picture on admission strongly suggested an early process of liver damage. A blood specimen showed sugar of 111 mg., uric acid of 4.7 mg., nonprotein nitrogen of 32 mg., urea nitrogen of 11.4 mg. and amino acid nitrogen of 7.4 mg. per hundred cubic centimeters of blood. The blood sugar was normal, while the uric acid and amino acids were at the upper limit of normal range. The urea nitrogen was 35 per cent of the nonprotein nitrogen, which was somewhat low as compared with 45 per cent, the average ratio in normal pregnancy according to Stander.¹¹ The carbon dioxide combining power of 28.2 was far below the value for normal pregnancy at term of 45 volumes per cent, indicating a low alkali reserve. The bilirubin of 6.7 mg. and the icterus index of 20 were considerably above the normal values. The van den Bergh test was direct

11. Stander, H. J.: *Bull. Johns Hopkins Hosp.* 35: 133 (Mar) 1924.

and immediate. The bromsulphalein test showed 40 per cent retention after thirty minutes. These findings suggested some form of liver damage. The blood sugar rose steadily during the next three days as a result of the large amounts of dextrose given. Subsequent blood specimens showed significant changes on January 31 (the fifth day of the disease), when the bilirubin was 11.4 mg. At this time the urea nitrogen formed 36 per cent of the nonprotein nitrogen and the amino acids reached a high point of 11.4 mg. On February 1 the bilirubin was 12.7 mg. and the icterus index was 120. The blood chlorides were consistently high throughout the course of the disease. On February 8 the serum albumin was 1.7 Gm. and globulin 2.8 Gm. per hundred cubic centimeters of blood. The patient was improving, when coughing produced evisceration and made a second operation necessary. This setback may account for the fall in the urea nitrogen ratio to nonprotein nitrogen, increase in bilirubin and amino acid nitrogen and the fall in blood sugar. The blood chemical studies were continued daily until the values were within normal limits. The blood sugar was carefully watched because of its dangerous fluctuations and it finally became stable on February 12.

Fig. 5.—Second biopsy specimen, showing stage of recovery with droplets of fat occupying less of area of each cell; $\times 300$. Compare with figure 3.

The urinary findings were not so complete. The twenty-four hour urine specimens were examined for urea nitrogen, the values being 1.8 Gm. on January 31, 156 mg. on February 3 and 576 mg. on February 6. Tyrosine was found in the urine on January 31, and leucine was negative. The excretion of urea was decidedly low and corresponded both with the low blood urea and with the severe clinical course. Ammonia nitrogen and the total nitrogen were not determined, but as the carbon dioxide combining power showed no acidosis after the first day we may assume that no unusual amount of ammonia was excreted.

Bollman, Mann and Magath¹² showed that formation of urea and deamination of amino acids in the body are dependent on the liver. These experiments explain the significance of a relative decrease in the urea nitrogen and increase in the amino acid nitrogen in the presence of damage to the liver. The low urea nitrogen, high amino acids, high bilirubin and the fluctuations of the blood sugar all pointed to an advanced degree of disintegration of liver function. Just as the pathologic changes observed in the liver of a recovered patient are not quite as extensive as those from an autopsy specimen, so also the chemical findings are not as striking as is seen in fatal cases.

OTHER LABORATORY FINDINGS

On admission the blood hemoglobin was 14.9 Gm., red blood corpuscles 5.5 million and white blood corpuscles 29,400, of which 84 per cent were polymorphonuclear leukocytes. The red cell count and hemoglobin were affected by intestinal bleed-

Fig. 6.—Second biopsy specimen, showing fat laden liver cells occupying half of each lobule around the central vein; $\times 55$. (Fat stain with scarlet red.)

ing late in the course of the disease. The leukocyte count gradually rose to 38,000 on February 7 and then slowly fell to 12,000. Daily examinations of the urine showed an occasional trace of albumin; sugar was positive on many occasions, and acetone was detected only once. Bilirubin was positive

Fig. 7.—Second biopsy specimen, showing fat droplets within the liver cells; $\times 300$.

during the first few days, and urobilin was consistently positive up to February 24. The renal function as shown by the phenolsulfonphthalein test was 60 per cent in two hours on February 6, February 17 and March 15. No casts were found. Cultures of the abdominal wound were positive for *Staphylococcus citreus* on six occasions. *Staphylococcus aureus* was

cultured once from the blood. Blood agglutination tests against *Eberthella typhosa*, *Proteus* X 19, *Salmonella enteritidis* and *Brucella abortus* were all negative.

PATHOLOGIC OBSERVATIONS

The pathologic examinations were made by Dr. C. H. Hu. The first biopsy revealed that the liver architecture was normal. The liver cells in the central three fourths or four fifths of each lobule showed very distinct cell borders and clear cytoplasm in which the granules were gathered into a small clump situated in the neighborhood of each nucleus, while the rest of the cytoplasm contained very few granules. Toward the periphery of the lobule the liver cells were less clear, their cytoplasmic granules became more uniformly distributed and the cell borders were less conspicuous. The liver cells in the central portion of the lobule also contained a small amount of yellowish pigment, which was absent in those at the periphery. There was no evidence of cell necrosis.

The sinuses were very narrow or collapsed. The Kupffer cells were inconspicuous. Occasionally one such cell in the central portion of the lobule contained a yellowish pigment.

Fig. 8.—Second biopsy specimen, showing stage of recovery with small bile duct and mild hepatitis above and junction of normal liver cells with those containing fat below; $\times 300$. Mitosis indicated by arrows.

The periportal spaces showed no striking change with the exception of infiltration by a few polymorphonuclear leukocytes and lymphocytes. The bile ducts were normal. The diagnosis was central fatty change of the liver, slight hepatitis.

The second biopsy revealed similar general microscopic features, but the following differences may be noted:

1. The clear cell central zone was smaller. It represented about one half instead of three fourths or four fifths of a lobule.

2. Infiltration of the polymorphonuclear leukocytes, lymphocytes and plasma cells was slightly more conspicuous.

3. The nonclear cells adjoining the clear cell zone showed frequent mitosis. Mitoses were also sometimes observed in the clear cells.

Frozen sections of both biopsy specimens stained with scarlet red were studied. They showed that the clear cells were filled with fat globules, most intensive in the middle one third to one half of the lobule and surrounded by a less intensive middle zone, bordering on the unaffected cells near the portal spaces. The diagnosis was central fatty change of the liver, slight hepatitis.

SIGNIFICANCE OF PATHOLOGIC FINDINGS

At the first operation there was a small amount of clear yellowish green fluid in the peritoneal cavity. The liver was normal in size and color. A small piece of tissue for biopsy was taken from the inferior margin. Except for its pallor it was not remarkable in appearance. During the second operation, nine days later, a large amount of bile tinged ascitic fluid was removed by suction. The liver was definitely smaller and a yellow tinge was apparent. The lobulations were normal and the site where tissue was removed for the first biopsy was healed. No nodular elevations were found, and the surface was smooth. A second specimen for biopsy was taken from the inferior margin of the liver. Grossly, the piece of tissue appeared lighter in color than the previous one but was otherwise not remarkable. From the pathologic report and accompanying photomicrographs, it was clear that the biopsies did not show areas of necrosis and that only a slight degree of hepatitis was present. The predominant lesion in both specimens was one of definite fatty degeneration involving four fifths of the liver cells around the central vein of each lobule in the first one and only one half of the liver cells in the same areas in the second. The affected cells were swollen with vacuoles of fat while a rim of cells around the portal spaces remained unaffected. It seemed definite that most of the fat laden cells may return to normal, when not irreparably damaged, without pronounced changes in the structure of the liver as reported in cases of nodular hyperplasia by Umber,¹³ Miller and Rutherford,¹⁴ Whipple¹⁵ and Pool and Bancroft.¹⁶

CLINICAL COURSE AND TREATMENT

It was of great importance that we demonstrated this patient on Jan. 25, 1941 to our students in discussing another subject. At that time she stated that she had had vomiting on and off through the whole pregnancy but that there had been no vomiting for several weeks. Loss of appetite and general weakness for one week before admission were sufficient to compel her to stay in bed. There was no icterus or other complaints. She contracted an infection of the upper part of the respiratory tract on January 25, and vomiting of coffee ground material began on January 26. On admission, vomiting of material containing blood, icterus and drowsiness were the outstanding findings. The temperature, pulse and blood pressure were within normal limits, and the physical examination revealed nothing of importance except the respiratory infection. The history of persistent vomiting for four days and the increase in drowsiness to the point of stupor were of course significant. Termination of the pregnancy as soon as the diagnosis of acute yellow atrophy of the liver is established is recommended by De Lee.¹⁷ The symptoms, the clinical findings and the presence of cephalopelvic disproportion decided the immediate course of treatment. As delivery could not be expected for hours or days, a cesarean section was performed, and during the operation removal of a piece of liver tissue for biopsy seemed justifiable. Unfortunately, in her drowsy state she was uncooperative to the use of local anesthesia, and gas and oxygen had to be used, supplemented by a small amount of ether. During the active course of the disease the blood sugar was determined several times a day before dextrose infusions. For twenty-five days she received from 210 to 370 Gm. of dextrose daily by intravenous infusions, mostly in the form of 20 per cent in isotonic solution of sodium chloride. In spite of the large amounts of dextrose given, the blood sugar was low and the patient had frequent symptoms of hypoglycemia. Small doses of insulin, 5 to 10 units, were given together with the infusions, in the hope that the sugar would be better utilized. It was not probable that hypoglycemia was due to the very small amounts of insulin given because this condition also occurred when no insulin was being used, and the failure of

the liver to store glycogen must have played an important role. On one occasion when the blood sugar was 280 mg. with sugar and acetone in the urine, 10 units of insulin was given. The blood sugar fell to 26 mg. within two hours, and the patient was in hypoglycemic shock. Blood transfusions of 200 to 400 cc. were given on eleven occasions in twenty-two days. The violent and continued coughing of the patient resulted in a complete separation of the abdominal wound on two occasions. During the repair of the first separation, a further study of this obscure liver condition by biopsy, with the patient in good condition, seemed desirable and harmless. Bleeding from the upper part of the gastrointestinal tract, which occurred after the second separation of the wound, complicated the picture. The prothrombin time was normal at the time of bleeding. Sulfanilamide was given cautiously, only 6 Gm., and discontinued. Sulfapyridine was given on February 13, 6 Gm. in twenty-four hours, and discontinued because of gastrointestinal hemorrhage. Throughout the entire course of the disease, opiates were administered in varying amounts as necessary. Thiamine hydrochloride 5 mg. twice daily was given during the first few days and later the dose was reduced to 5 mg. daily. The blood pressure and the fundi were found to be normal, but one week after operation, when the blood pressure was elevated, the fundi showed hypertensive changes

indicated liver damage. It is fair to assume that during the next two days, when the patient was in critical condition and when the chemical findings of the blood showed greater impairment of liver function, that the extent of liver damage was also correspondingly increased. The second biopsy showed intensive fatty degeneration but involving only one half of each lobule, and at this time the chemical findings in the blood also indicated improvement. From this and the observations of others in fatal cases there seems to be a rather definite correlation between the extent of fatty degeneration and the results of the blood chemical tests. Stander¹⁸ reported a fatal case which was more severe but otherwise similar to ours. One of the cases reported by Baens and Espinola¹⁹ also was similar.

Sheehan²⁰ reported 6 fatal cases very similar, if not identical, to this one as a separate entity apart from true acute yellow atrophy and suggested the name obstetric yellow atrophy. We are not willing to do this on the basis of present knowledge, because the clinical course is identical, and the location and general type of lesion are the same. We may have to change our conception,

Fig. 9.—Fatty degeneration of liver in pregnancy. Blood sugar, dextrose therapy and transfusion.

of the retinal vessels. The irregular heart beat persisted throughout the course of the disease. An electrocardiogram taken on March 7 suggested myocardial damage, while a subsequent examination on March 19 was normal. The bromsulphalein and hippuric acid tests repeatedly showed impairment of liver function until March 7.

COMMENT

The demands on the liver are especially insistent in the last half of pregnancy. This patient had not been eating well for ten days. An infection of the upper part of the respiratory tract in the presence of impaired liver function may well have been the etiologic factor.

The importance of early recognition and treatment of this condition cannot be overemphasized. Too little attention is frequently given to mild symptoms. The occurrence of fatigue and loss of appetite in a woman near term is significant. With the appearance of icterus, investigation is indicated, and, if drowsiness ensues, the diagnosis of liver damage is almost certain. The life of the patient depends on vigorous treatment with dextrose and termination of the pregnancy by the most conservative means. Also the many and timely blood transfusions contributed to the recovery of the patient.

It will be noted that the area of fatty degeneration involved three fourths to four fifths of the liver lobules in the first biopsy, at the time when the blood chemistry

but at this time it seems to be a matter of degree; that is, acute fatty degeneration of the liver is one stage in the process of necrosis. It seems reasonable to conclude that the dose of the hormone, toxin, poison, infection or combination of these factors could be insufficient to cause actual necrosis but still be sufficient to be usually fatal.

The cause of both ascites and hemorrhage from the upper part of the gastrointestinal tract was not clear. There was no cirrhosis of the liver to account for these conditions. The renal function as determined by the phenolsulfonphthalein test was normal. The ascites in this case might have been due to the extremely low level of serum albumin. The hematemesis was probably not caused by varices. The duodenal tube did not cause the bleeding, as it continued after the tube was withdrawn and stopped after the tube had been replaced. Penner and Bernheim²¹ explained bleeding of this nature in cases of shock due to peritonitis, diabetic acidosis, hemorrhage or operation on the basis of a

resuscitation procedures following failure of some other method. A brief report¹ on the phenomenon of asphyxial resuscitation will appear shortly.

COMMENT

In a paper reporting physiologic studies in experimental asphyxia and drowning, Loughheed, Janes and Hall² state (p. 426):

Asphyxia may be maintained for only a comparatively short period of time if recovery is to take place. This time varied with the individual animal but rarely exceeded four minutes;

Fig. 7 (dog 22).—Nitrogen inhalation asphyxia by way of intratracheal tube: A, respiration ceases. B to C, rhythmic suction at 8 mm. of mercury pressure with oxygen inhalation. D, spontaneous respiration.

Fig. 8 (dog 22).—Nitrogen inhalation asphyxia by way of intratracheal tube: A, respiration ceases. B to C, asphyxial gasps. C to D, rhythmic suction at 8 mm. of mercury pressure with oxygen inhalation fails to resuscitate. D, resuscitator with oxygen fails to resuscitate.

in some animals recovery has occurred after the trachea has been clamped for seven minutes, while other animals failed to recover after temporary asphyxia of two minutes' duration. Another interesting feature was observed in the time interval between the cessation of respiratory efforts during asphyxia and the cessation of expulsive cardiac beats. This interval varied only from eleven to seventeen seconds. If the asphyxia was maintained four or five seconds longer, resuscitation was of no avail.

1. Artificial respiration: Asphyxia was maintained by clamping the trachea for varying periods of time. As noted in the

previous section, the periods of asphyxia after which recovery would take place depended upon the critical interval after the cessation of the respiratory efforts (eleven to seventeen seconds). If the asphyxia was relieved during this short period, spontaneous recovery took place in the great majority of cases. If, however, the asphyxia was maintained for slightly longer

Fig. 9. (dog 20).—Nitrogen inhalation asphyxia by way of intratracheal tube: A, respiration ceases. B to C, rhythmic suction at 8 mm. of mercury pressure with nitrogen inhalation; blood pressure continues to fall. C to D, resuscitator with nitrogen. E to F, resuscitator with nitrogen started again. F, spontaneous respiration.

periods of time (even a few seconds) spontaneous recovery did not take place. In this period where spontaneous recovery did not occur, artificial respiration if instituted immediately practically always resulted in successful recovery. The longer the period of asphyxia, the longer artificial respiration had to be maintained. It must be emphasized, however, that successful artificial respiration was possible only when started within a few seconds after the time when spontaneous recovery could take place. Precisely the same criteria had to be applied in the cases where asphyxia was produced by experimental drowning.

As a result of our experiments we consider that prompt, adequate and prolonged artificial respiration is the fundamental treatment for drowned, asphyxiated or electrocuted persons. In the case of drowning the additional procedures as outlined above are recommended for the reasons stated.

Our findings support the view that manual artificial respiration must be instituted early to effect resuscitation when the respiration has ceased. However, in a

Fig. 10 (dog 5).—Nitrogen inhalation asphyxia at the mask: A, respiration ceases. B to C, resuscitator with oxygen; notice the sharp recovery of blood pressure by resuscitator in contrast to the slow recovery by manual artificial respiration (fig. 1). D, spontaneous respiration.

few instances manual artificial respiration with oxygen was effective after a longer period of time following cessation of respiration than the critical period of Loughheed, Janes and Hall. Likewise, resuscitation with

1. Thompson, S. A., and Birnbaum, G. L.: The Phenomenon of Asphyxial Resuscitation; Resuscitator with Inert Asphyxiating Gases. Preliminary Report, Proc. Soc. Exper. Biol. & Med. 48: 203-204, 1941.
2. Loughheed, D. W.; Janes, J. M., and Hall, G. E.: Physiological Studies in Experimental Asphyxia and Drowning. Canad. M. A. J. 40: 423 (May) 1939.

rhythmic insufflation of oxygen was possible at a longer period after the cessation of respiration. Rhythmic inflation and suction of oxygen was by far the most effective of the methods and at very much longer periods after cessation of respiration.

We have merely touched on the subject of resuscitation with inert (asphyxiating) gases. In subsequent papers of the series this phenomenon and its mechanism will be taken up in detail. It will then become even more evident that the suck and blow mechanism, within safe limits of pressure, rests on sound physiologic principles.

Henderson and Turner³ have found that suck and blow mechanism, using pressures of plus 15 and minus 15 mm. of mercury, could do no serious harm to the lung. However, they believe that manual artificial respiration is more effective than mechanical resuscitation.

Manual artificial respiration is a valuable procedure and should be immediately instituted when the respiration has ceased and continued until respiration returns or until other and more efficient facilities are available. We have found, however, that positive-negative resusc-

tures used gives a distinctly greater pulmonary ventilation than manual artificial respiration or rhythmic inflation. Overventilation and acapnia (carbon dioxide deprivation) is eliminated as a possibility by the addition of 5 to 7 per cent of carbon dioxide to the oxygen.

Fig 12 (dog 37) —Mechanical obstruction asphyxia by clamping intra tracheal tube the phenomenon of asphyxial resuscitation (resuscitation with inert gas): A, respiration ceases B to C, resuscitator with nitrogen, notice recovery of blood pressure D, spontaneous respiration occurs, animal now allowed to breath atmospheric air.

Summary of One Hundred and Six Experiments with Different Resuscitative Procedures

	Oxygen			Nitrogen		
	Suc-cess	Fail-ure	Per-centage	Suc-cess	Fail-ure	Per-centage
Manual artificial respiration	6	5	55	1	6	15
Rhythmic inflation	7	2	78	2	10	17
Rhythmic suction	4	1	80	1	4	20
Resuscitation (rhythmic inflation and suction).	21	1	95	30	5	85

tation is superior to manual artificial respiration as a life-saving measure. Another feature of positive and negative resuscitation is its efficacy in advanced asphyxia with cardiac failure. We have been able to resuscitate the circulation and respiration many times by a combination of mechanical resuscitation with oxygen plus heart massage; these data will be reported in another paper.

When in asphyxia the respiration has ceased, rhythmic inflation and suction of the lungs at the pres-

Moreover, before respiration has resumed, rhythmic resuscitation with positive and negative pressure does not depend on muscle tonus of the respiratory muscles (as do manual artificial respiration, rhythmic inflation alone or rhythmic suction alone) for adequate pulmonary ventilation.

While it is true that mechanical suck and blow resuscitation may work "out of step" with the breathing animal, we advise the use of a resuscitator only when the respiration has failed; when respiration is still going on, inhalation of oxygen or oxygen-carbon dioxide is indicated. When respiration has been restored and acts "out of step" with a mechanical resuscitator, it indicates the successful return of spontaneous respiration and it is time to desist from the use of mechanical resuscitation and to use inhalation.

CONCLUSIONS

1. In advanced asphyxia, after cessation of respiration, rhythmic inflation and suction of oxygen or oxygen-carbon dioxide at safe pressures is definitely

Fig 13 (dog 33) —Helium inhalation asphyxia by way of intratracheal tube A, respiration ceases B, resuscitator with helium started three and a half minutes after cessation of respiration, a rise and then a fall of blood pressure occurs when the resuscitator is stopped C, resuscitator with helium started again; failure to resuscitate

superior to manual artificial respiration or rhythmic inflation.

2. Rhythmic inflation and suction regularly produce resuscitation even with inert (asphyxiating) gases.

Clinical Notes, Suggestions and New Instruments

SEVERE ARSENICAL REACTION ENCOUNTERED IN THE FIVE DAY TREATMENT FOR EARLY SYPHILIS

HERBERT RATTNER, M.D.,
AND
ALFRED B. FALK, M.D.,
CHICAGO

This is to record the first serious reaction affecting the kidneys, liver and heart from the use of mapharsen in the treatment of early syphilis by the five day massive dose method. One of the significant facts noted in our experience of 348 patients treated by this method, and among the 1,150¹ or more patients treated similarly by the Middle Western Cooperative Group, has been the lack of serious damage to important parenchymatous organs. There have been reports of several cerebral accidents,² some of them fatal, and minor side effects have been encountered frequently—nausea, emesis, headache, fever, painful arms and toxic eruptions. Aside from transitory albuminuria and a slight elevation of the icteric index, however, there have been no reports of a reaction in which the toxic manifestations were those of an acute glomerulonephritis, anuria, uremia, hepatitis, ileus and pericarditis.

REPORT OF CASE

A Negro aged 23 had a penile chancre of four weeks' duration from which *Treponema pallidum* was demonstrated and a papular syphiloderm of the body of one week's duration. The blood tests gave strongly positive reactions with a quantitative titer of 40 Kahn units. Except for an attack of typhoid in 1933, he had had no previous illnesses. His general physical condition was excellent. The laboratory studies, which included a complete blood count, blood chemical determination, urinalysis including a urobilinogen determination, icteric index determination and a roentgenogram of the chest, gave results that were

Fig. 1.—Appearance of the patient during the acute phase of his illness.

within normal limits. For these reasons it was decided that his condition was suitable for the intensive five day treatment by the intravenous drip method.

From the Department of Dermatology, Cook County Hospital, and the Department of Public Health, State of Illinois, R. R. Cross, M.D., Director, and Herman Soloway, M.D., Venereal Disease Control Officer; with the cooperation of the United States Public Health Service.

1. Information supplied by D. C. Elliott, M.D., United States Public Health Service.

2. Leifer, William; Chargin, Louis, and Hyman, H. T.: Massive Dose Arsenotherapy of Early Syphilis by the Intravenous Drip Method, *J. A. M. A.* 117:1154 (Oct. 4) 1941. Elliott, D. C.; Baehr, George; Shaffer, L. W.; Usher, G. S., and Lough, S. A.: Massive Dose Therapy of Early Syphilis, *ibid.* 117:1160 (Oct. 4) 1941.

Throughout the first day of treatment he along with 4 others undergoing treatment at the same time experienced some discomfort from nausea, emesis, headache and pain in the arm, but he was able to take the full dose for the day of 0.24 Gm. of mapharsen dissolved in 2,000 cc. of 5 per cent dextrose solution. In the evening the emesis became more frequent and he became lethargic. The following morning there was a large quantity of albumin in the urine; later in the day he

Fig. 2.—Appearance of the patient one month later.

ceased to void, and during the next eighty hours there was complete anuria and the gradual development of edema of the face. Then dyspnea and orthopnea developed and later moist rales were heard in the base of the left lung. On the fourth day he suffered a generalized convulsion, and after a few hours uremic frost appeared on the nasolabial folds. By this time he was voiding only 500 cc. of urine, which still contained albumin and red blood cells. The nonprotein nitrogen was 170 mg. per hundred cubic centimeters and the creatinine was 16.8 mg. per hundred cubic centimeters.

On the sixth day there was evidence of hepatitis—enlarged liver, icteric scleras and an icteric index of 25—and bothersome singultus and emesis which persisted for two weeks. Ileus developed on the ninth day, and there was considerable distention for forty-eight hours. Then on the eleventh day there appeared a pericardial rub which persisted for three weeks. Despite the later developments, the general well-being of the patient seemed to improve after the first week. There was no precordial pain and he was now voiding 2,000 cc. of urine in twenty-four hours.

He received treatment with digitalis, adrenal cortex extract (eschatin), a prostigmine compound, blood plasma, isotonic and hypertonic fluids intravenously, deep diathermy administered over the renal areas, suction with a Wangenstein apparatus and various other supportive measures.³

The patient five and one half months after the reaction showed no effects of it whatever. The blood test gave a negative reaction on the tenth week and has remained negative.

SUMMARY

A case was seen in which acute glomerulonephritis, anuria, uremia, hepatitis, ileus and pericarditis developed from the use of mapharsen in the treatment of early syphilis by means of the intensive five day treatment method. It is the first such reaction encountered among some 1,150 patients treated similarly by the Midwestern Cooperative Group. The patient recovered from the reaction. We have had no fatalities in 348 cases treated by this method.

25 East Washington Street.

3. Drs. A. B. Rimmerman and Arthur Bernstein of the medical staff of the Cook County Hospital helped in the management of the patient, and, after further observations, will report on the medical aspects of the case.

BASAL METABOLISM IN THE SAME PERSON AFTER
AN INTERVAL OF FIFTY YEARS

ADOLF MAGNUS-LEVY, M.D., NEW HAVEN, CONN.

My basal metabolism was first examined in Zuntz's laboratory in 1891 at the age of 26 years. When I was 76 I had the opportunity of having it reexamined by Dr. Walter A. Boothby when I was at the Mayo Clinic in 1941 to give a lecture. During the interval, no measurements were made. Although the figures reveal nothing new, it might be of interest to publish them since they are unique.

The decline of basal metabolism with advancing age, established by Falk and Magnus-Levy,¹ has been subsequently confirmed by a number of workers. Du Bois² quotes values of 39.5 calories per square meter per hour at 20 to 30 years and 35.5 calories per square meter per hour at 70 to 76 years, a decrease of 10 per cent.

My record is given in table 1.

The values for surface area are based on Du Bois's formula. The decline in weight has been 7.5 Kg. and is most probably due to dwindling of the musculature, since my fat tissue has always been scarce and since my muscles, which are still firm, were exceedingly well developed and well trained in my youth. The decrease in energy output when expressed in

Du Bois ²	30	38.1	-4	-4	0
	58	34.5	-7	-4	-4

calories per square meter per hour has been 17 per cent: 38.0 to 31.5. These figures are below the Aub and Du Bois³ standard both in youth (-4 per cent) and in old age (-11 per cent). I was not subjected to undernourishment in Germany in either 1939 or 1940. My blood pressure is 170 systolic and 80 diastolic and my pulse rate is 40 per minute. The latter has always been low, having been less than 50 for twenty to thirty years.

There have been metabolism figures published for another "old professor," my beloved teacher Nathan Zuntz.⁴ His seventieth year is compared to his forty-first and sixty-third years. The figures for weight, and its decline, are almost identical with mine, as are also those of oxygen intake and calories per square meter per hour, if one calculates them according to Du Bois's formula instead of Meel's formula, which was used by Zuntz himself. From 41 to 63 years of age his oxygen consumption and energy output varied only slightly, i. e. within a range of a few per cent. At 70 there

3. Aub, J. C., and Du Bois, E. F.: Clinical Calorimetry, Arch. Int. Med. 19: 823-831 (May) 1937.

4. Zuntz, Nathan, and Loewy, Adolf: Berl. klin. Wchnschr. 53: 825-829, 1916; Biochem. Ztschr. 90: 244-264, 1918.

had occurred a decrease of 10 per cent in weight, of 15 per cent in oxygen consumption and of 13 per cent in the output of calories when expressed in terms of surface area. Zuntz, without referring to old age, ascribed the decline exclusively to undernutrition during the World War (1916-1917). That period, however, affected him only in a limited way, even though it influenced Loewy, then only 53 years of age, tremendously.

Table 2 presents the figures for a number of "professors"⁵ and shows their deviation from several standard curves.

Council on Pharmacy and Chemistry

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING
STATEMENT.

AUSTIN E. SMITH, M.D., Acting Secretary.

The Council on Pharmacy and Chemistry of the American Medical Association records with deep sorrow the death, Jan. 31, 1942, of

Soma Weiss

On January 31 Soma Weiss died at the age of 43 of a spontaneous subarachnoid hemorrhage. In his premature death the medical profession lost one of its greatest leaders. He was a persuasive and stimulating teacher, a resourceful clinician, a brilliant investigator whose interests and contributions extended to the most diverse fields of medical science. Few men have exerted so great an influence or have been so admired and beloved. To his clinic went many of the most able young men in this country. He offered them the wealth of his clinical experience and the stimulation of his constructive imagination. He was their counselor and friend. No one of them departed without enthusiasm or without the desire to contribute to medical teaching and to the advancement of medical science. Today many of his former interns and residents are leaders in their own right and are carrying to others the light which they received from him.

To the work of the Council on Pharmacy and Chemistry Soma Weiss brought a unique experience. While still a young student in Hungary he served for three years as a Research Fellow in Physiology and Biochemistry at the Royal Hungarian University in Budapest. He left Hungary mainly because the disturbed political condition offered a discouraging outlook for study and research. Almost immediately after his arrival in this country he became associated with Dr. Robert A. Hatcher, who was probably one of the first to recognize his remarkable capacity. For the next three years while still a student at Cornell he served as assistant in pharmacology and took an active and often a leading part in many important investigations. After graduation he went to Bellevue Hospital, where he continued his research work. This fundamental training and experience in pharmacology had a significant influence in all his subsequent investigations and clinical activities. At a time when the chief emphasis in teaching was on diagnosis and prognosis, Soma Weiss was one of the few clinicians who could bring exact pharmacologic knowledge to the bedside and who could utilize adequately pharmacologic techniques in the vast field of practical therapeutics. At Bellevue, and later in the City Hospital and at Peter Bent Brigham Hospital in Boston, he was exposed to an immense amount of clinical material, which gave ample scope for the application of his methods. With such a background he was able to contribute first hand information concerning most of the problems which came for consideration to the Council on Pharmacy and Chemistry. His fellow members on the Council realize fully what a tremendous loss to medicine his death involves, but they feel also, and more keenly, the loss of a much beloved friend and a wise counselor to whom all freely turned for advice and help.

SATURDAY, APRIL 18, 1942

THE VENEREAL DISEASE PROBLEM IN WAR

Invariably in past wars there has been an increase in the rates for the venereal diseases. The Annual Report of the Surgeon General of the United States Army for the fiscal year 1941 shows that the venereal disease rate increased in the recent prewar period of mobilization from 29.6 per thousand men in 1939 to 42.5 per thousand men in 1940.

Infected persons in the civilian population, particularly prostitutes, are links in the chain of infection of the armed forces with syphilis and gonorrhea. Frequently the venereal disease rate in the Army and Navy is comparable to the incidence and prevalence of syphilis and gonorrhea in the civilian population in the area in which the armed forces are located. Therefore the civilian program for control of venereal disease must be maintained at the optimum effective level during war.

The War Department is preparing to meet this problem. A venereal disease control officer will be assigned to each corps area headquarters to stimulate work against venereal disease. Furthermore, army venereal disease control officers will be appointed to each command with a strength of more than twenty thousand men. These new control officers will work with health departments and other civilian agencies. Attempts will be made to examine all contacts with infected men and to treat those who are found infected. The program will also include the strengthening of prophylactic measures, the provision of more adequate physical inspection to detect venereal diseases early, improvement in methods for the diagnosis and treatment of infected military personnel, provision of additional recreational facilities in cooperation with other military agencies, and intensification of the educational program.

A cardinal principle of epidemiology in the control of communicable diseases is limitation of the number of contacts between infected, potentially infected and healthy persons. This principle applies in syphilis and gonorrhea as much as it does in other communicable diseases. Already there is evidence that some physicians

have placed in the hands of irresponsible prostitutes certificates with the connotation that these women are free from the venereal diseases. The scientific evidence available indicates that certification of this kind is worthless. Any local, municipal system that encourages such certificates trifles not only with the health of its civilian population but also with that of the Army and Navy.

THE ADJOURNED MEETING OF THE 1940 PHARMACOEPIAL CONVENTION

On April 7 the adjourned session of the decennial U. S. Pharmacoepeial Convention reconvened in Cleveland to permit discussion of proposed amendments to the constitution and by-laws. This meeting was in accordance with instructions given by the 1940 convention ". . . to meet at the call of the Board of Trustees to receive the report of the Committee on Constitution and By-Laws. . . ." The committee, which consisted of nine voting members of physicians, pharmacists and one representative of a governmental agency, had been charged with preparing a draft of the new constitution and by-laws promulgated at the 1940 convention. The object of the changes is to reduce the number of delegates to insure a representative delegation and to simplify the general methods of procedure for the convention proper.

The success of the meetings in Cleveland was largely due to the efforts of this committee and the understanding and cooperation of the board of trustees of the Pharmacopeia. This success was not marred by the knowledge that legal opinion had advised that amendments to the constitution could not be finally acted on until the 1950 decennial meeting of the convention. Although the by-laws could be voted on and adopted at the present meeting, none of the new by-laws could replace any of the terms of the present constitution concerning membership requirements, number of delegates or their appointment and terms of office, or the personnel elected at the 1940 meeting. The by-laws which existed at the termination of the latter meeting are effective until the 1950 meeting, but the new by-laws which were discussed and adopted in Cleveland will guide the organization and outcome of the 1950 meeting.

The constitution as read at the Cleveland session was simply received for presentation to the 1950 meeting. Of special interest are certain new statements in the by-laws. Under article II, membership, are the provisions "The members of the United States Pharmacoepeial Convention shall consist of accredited delegates representing the following institutions and organizations, and designated divisions of the federal government. . . . Each institution, organization and designated division of the federal government entitled to representation in the United States Pharmacoepeial Convention . . . shall be

entitled to one delegate or an alternate in the decennial meetings of the Pharmacopeial Convention. Each delegate or his alternate shall be an officer or member of the academic staff of the college or school, an active member of the association or society, or an employee of the division of the federal government which he represents. . . . A delegate shall not represent more than one college, school, association, society or division of the federal government."

Under the old by-laws, article I, chapter 5, there appeared the ambiguous statement "The General Committee of Revision shall consist of fifty members to be elected at the decennial meeting, together with the president of the convention, ex officio." At the recent convention the members voted that "The General Committee of Revision shall have a membership of sixty persons, of whom twenty shall be qualified in medical sciences and forty in pharmaceutical and allied sciences, together with the president of the Pharmacopeial Convention, ex officio, and the director of the Pharmacopeial Convention, ex officio."

Whereas former by-laws provided for the nominating committee to nominate the officers of the convention, the board of trustees and the general committee of revision, the new amendments state that the secretary of the nominating committee shall request all organizations entitled to representation to submit the names of individuals qualified for this work. Each submitted name must be accompanied by a statement depicting the qualifications of the nominee. Thus, when a delegate presents his credentials he will be offered a list of names of forty persons qualified in the medical sciences and eighty persons qualified in the pharmaceutical and allied sciences. Further nominations may be received from the floor and seconded by at least four delegates. At the final session of the decennial meeting, voting by ballot will be conducted.

No doubt such provisions as these will prevent a repetition of the confusion and doubtful motivations which prevailed in the 1930 assemblage. As the Pharmacopeia plays an ever increasingly important part in the enforcing of laws governing official drugs in interstate commerce, physicians and pharmacists should maintain their interest in providing the best pharmacopeia possible. Because of the significance of the Pharmacopeia to the practice of medicine the American Medical Association, through its Board of Trustees, its Council on Pharmacy and Chemistry and *THE JOURNAL*, has repeatedly urged efforts toward the development of a pharmacopeia most compatible with the needs of modern medicine. As we have stated before,¹ the adoption of this new constitution and by-laws will be a step toward facilitation of work, discouragement of self seeking, and the maintenance of a scientific spirit.

FEBRILE DESTRUCTION OF ANTIBODIES

A serious challenge to conventional theory on which fever therapy is based comes from the demonstration by Ellingson and Clark¹ of the University of Wisconsin that hyperpyrexia causes a significant lowering of specific antibody titer in experimental animals. In 1908 Rolly and Meltzer² tested the influence of artificial fever on the resistance of rabbits to experimental bacterial infections. Groups of 2 or more rabbits were given repeated sublethal inoculations of pneumococci, staphylococci, *Escherichia coli* or *Pseudomonas aeruginosa*. One animal of each group was kept at room temperature to serve as a control and the others were confined to a heated chamber. All the control animals died of the repeated sublethal inoculations. Of the 11 febrile animals (rectal temperatures were not recorded) but 4 died. This was taken as proof that the febrile state increases antimicrobial resistance.

According to the orthodox side chain theory of the time, this increase could mean only that fever increases specific antibody titer. This presumptive logical deduction from their data was confirmed by experimental tests. For example, 2 rabbits which had been inoculated with a cholera vaccine and confined for nine days in a heated box showed specific agglutinin titers of 1:200 and 1:500, or an average of 1:350. Two control rabbits similarly inoculated but kept at room temperature each showed an agglutinin titer of 1:200. Their conclusion that hyperpyrexia accelerates specific antibody production was soon quoted in textbooks of pathology and clinical medicine and became the basis for the widely prevailing belief that fever is a wise provision of nature automatically increasing bodily defenses against invading micro-organisms.

Clinical interest in this conclusion, however, was not fully aroused till von Wagner-Jauregg³ reported the beneficial effects of artificial malarial infection on tabes dorsalis and dementia paralytica. It was assumed that the resulting febrile state was responsible for the favorable results. This observation started a trend of clinical investigation and trial and led to the acceptance of artificial fever in the treatment of several infectious diseases.

The basic immunologic belief underlying this fever therapy, however, has not been without its critics. Ecker and O'Neal,⁴ for example, found that in rabbits immunized against typhoid vaccine the specific typhoid agglutinin titers were depressed fully one half as a result of hyperthermia. Hadjopoulos and Bierman⁵ found that the complement fixing antibodies of rabbits previously immunized against pyogenic cocci were similarly depressed.

3. von Wagner-Jauregg, Julius: *Psychiat.-neurol. Wehnschr.* **20**: 132, 251, 1918-1919.

4. Ecker, E. E., and O'Neal, M.: *Am. J. Pub. Health* **22**: 1050, 1922.

5. Hadjopoulos, L. G., and Bierman, William: *J. Lab. & Clin. Med.* **20**: 227 (Dec.) 1934.

1. The Pharmacopeial Convention of 1940, editorial, *J. A. M. A.* **114**: 2116 (May 25) 1940.

None of the earlier experimenters or critics used a sufficiently large number of animals or a sufficiently wide range of antigens to render their data statistically significant. Ellingson and Clark therefore repeated the earlier tests on groups of at least 12 rabbits, selecting such typical antigens as sheep erythrocytes, egg albumin and *Eberthella typhosa*. One series of 12 rabbits, for example, was given three intravenous injections of 5 cc. of 10 per cent washed sheep cells on successive days. Six of these were kept at room temperature, and the others given a severe fever (41.6 C., or 106.9 F., rectal temperature) for periods of four hours on each of the three days of inoculation. The fever was caused by placing the rabbits in well ventilated incubators. Composite data showed that hemolytic amboceptor was produced by both subgroups by the sixth day. In both groups the titer increased to a maximum by the twelfth day and then decreased, till about 50 per cent of the amboceptor had disappeared by the twentieth day. Throughout this process, however, the average titer of the fever group was but half that of the nonheated controls. Thus on the twelfth day the average control titer was 6,400 units of amboceptor, with but 3,840 units present in the febrile animals.

Even more striking differences were seen in the series of 12 rabbits given seven intravenous injections of typhoid vaccine. In this series the injections were made on alternate days. A rectal temperature of 41.5 C. (106.7 F.) was induced in half of the animals for eight hour periods daily for twenty-two days. Throughout the observation period of fifty-seven days the average titer of the febrile animals was rarely more than one-fourth that of the unheated controls. Thus on the twentieth day the average febrile typhoid agglutinin titer was 1:832, as contrasted with an average of 1:2,133 in the normal controls. On the fifty-seventh day the averages had fallen to 1:76 and 1:266 respectively. An equally striking febrile reduction in specific precipitin formation was recorded for groups of rabbits immunized against crystallized egg albumin.

Certain groups of previously immunized rabbits were given fever therapy for an eighteen hour period and examined immediately after this treatment. The average agglutinin titer was reduced three fourths by this heating. Under the influence of a daily fever the titer of these rabbits was further reduced to one eighth of the original by the eighth day. This febrile destruction of specific antibodies was also noted in groups of rabbits passively immunized against the typhoid bacillus.

From these data it would seem that artificial fever not only inhibits specific antibody formation but accelerates antibody destruction. The fact that artificial fever reduces antibody titer, however, does not justify the conclusion that fever therapy is without beneficial effects. Carpenter and his associates,⁶ for example,

have demonstrated that fever temperatures may actually kill gonococci and the spirochete of syphilis. Dyson⁷ and Shaffer⁸ have shown that the rate of proliferation of hemolytic streptococci and pneumococci is greatly reduced at temperatures above 40 C. (104 F.). Moreover, circulation may be stimulated and capillary permeability increased by hyperpyrexia, so that local toxic products may be more rapidly neutralized, diluted or removed, in spite of reduced antibody titer.

Finally, it is definitely known that the phagocytic power of leukocytes is increased by febrile temperatures. Ellingson and Clark, for example, found that the maximal phagocytic activity of guinea pig leukocytes is noted between 39 and 41 C. (102.2 and 105.8 F.), the usual fever range in these animals to infectious processes. Rolly and Meltzer found that with human leukocytes phagocytosis is greatest at fever temperatures (39.5 to 40 C., or 103.1 to 104 F.), an observation confirmed by the Wisconsin bacteriologists, who found that the increased phagocytosis even continues till the temperature reaches 41 C. (105.8 F.).

The fact that artificial fever causes a reduction in the titer of all circulating antibodies must be taken into account in future clinical studies of this method of clinical therapy. Whether there is a parallel reduction in the nonhumoral or fixed tissue defenses has not yet been determined, a determination that might have particular significance in virus disease.

MEDICAL-PHARMACEUTICAL CONFERENCE

THE JOURNAL has drawn attention previously to the Cleveland medical-pharmaceutical conference.¹ A historic and important step was taken to further professional relations between medicine and pharmacy when the conference met on April 6. More than two hundred pharmacists and physicians assembled to hear and discuss papers delivered by Dr. Howard Dittrick, practicing physician of Cleveland, E. F. Kelly, Phar.D., Secretary of the American Pharmaceutical Association, and Robert C. Wilson, dean of the School of Pharmacy, University of Georgia. These papers, which were entitled "Evolution of the Apothecary," "Trends of Pharmaceutical Practice" and "Objectives of the Program of Pharmaceutical Education," were provocative and elicited excellent discussions. Those who participated in the discussion included Dr. Morris Fishbein, Chicago; P. H. Costello, Cooperstown, N. D.; Charles H. Rogers, Minneapolis; Carson P. Frailey, Washington, D. C.; E. Fullerton Cook, Phar.D., Philadelphia; Wortley F. Rudd, Richmond, Va.; A. G. DuMez, Baltimore; Robert L. Swain, New York; Max Lemberger, Milwaukee; Dr. Theodore G. Klumpp, New York, and Dr. Allen H. Bunce, Atlanta, Ga.

7. Dyson, C. B.: *J. Path. & Bact.* 47: 641 (Nov.) 1938.

8. Shaffer, M. F.; Enders, J. F., and Wilson, James: *J. Clin. Invest.* 17: 133 (March) 1938.

1. Medical-Pharmaceutical Conference, Current Comment, *J. A. M. A.* 118: 960 (March 14), 1145 (March 28) 1942.

6. Carpenter, C. M.; Boak, Ruth A.; Mucci, L. A., and Warren, S. L.: *J. Lab. & Clin. Med.* 18: 981 (July) 1933.

The evening session included a dinner, with an address by Dr. Morris Fishbein entitled "Status of Medicine and Pharmacy In the War and After," and a formal discussion which was opened by Col. W. L. Fox of the Army Medical Corps, Fort Knox, Kentucky, and Dr. Walter A. Bastedo and Dr. Cary Eggleston of New York.

This joint meeting of the American Medical Association and the American Pharmaceutical Association is historic in that it is the first of its kind in the history of these two organizations. Agreement was general that the appropriate representatives of each association carry back a report of the meeting to their respective board of trustees, with the request that consideration be given to arranging another similar session. While the current meeting resolved itself into one of good will, a further meeting might serve as a basis for more concrete steps to improve medical-pharmaceutical relations and to orient certain common problems.

Current Comment

HAZARDOUS OCCUPATIONS FOR YOUNG WORKERS

The Fair Labor Standards Act of 1938 established a 16 year minimum age for employment in plants manufacturing goods for shipment in interstate commerce and also provided for the establishment of an 18 year minimum age in any occupation found and by order declared to be particularly hazardous for the employment of minors by the chief of the Children's Bureau of the U. S. Department of Labor. Reports and orders already issued by this bureau have dealt with the manufacture of explosives, driving of motor vehicles or serving as helper, coal mining, logging and sawmilling and the operation of wood working machines. Recently a sixth in this series of reports on occupations hazardous to young workers has been issued on radioactive substances, under the guidance of a distinguished list of medical and technical advisers. The recent review is concerned mainly with exposures and working conditions in plants preparing or applying self-luminous dial paint which is crystalline zinc sulfide activated by radium or in plants manufacturing incandescent mantles which are made from rayon mesh fabric dipped in "lighting fluid," a 25 to 50 per cent solution of 99 parts of thorium and 1 part of cerium nitrates. Surveys have demonstrated that unsafe practices persist, although the tragic custom of lip pointing brushes used in dial painting is no longer observed. Investigation in a plant regarded as representative showed concentrations of radioactive gas up to four times the most liberal recommended maximum permissible limit. Every one with substantial knowledge of these industrial processes, including the employers, concurs in the opinion that minors under 18 years of age should not be engaged in work of this description. They are not so likely to possess the qualities of carefiness, neatness, forethought and attention to personal hygiene essential to the observation of safe

practice. Hearings will no doubt corroborate the findings in this report; an order will then be issued which will have the effect of eliminating exposure of this kind at least as far as minors under 18 years of age are concerned.

KOCH'S CANCER TREATMENT MEETS THE LAW

THE JOURNAL has repeatedly¹ called attention to the promotion of products by the Koch Laboratories. Again and again it has urged federal agencies to display an interest in the matter. The *Detroit Free Press* for Sunday, April 5, notes that "Federal agents took action Saturday against Koch Laboratories, Inc., 8181 E. Jefferson, by arresting Louis Koch, the concern's secretary treasurer, in Detroit and Dr. William F. Koch, president, in Delray Beach, Fla." It notes that the Kochs "will face charges of violating the Federal Food, Drug and Cosmetic Law on 11 specific charges." The *Free Press* reports that Dr. Koch was arrested on a removal warrant and was released on a \$5,000 bond pending a hearing in Detroit on April 15. Assistant United States Attorney John C. Ray is quoted as saying with regard to the concern's synthetic antitoxin "A thimbleful of this liquid sells for \$25 to practitioners and they get as much as \$300 from patients. Chemical analysis shows that the dilution is so infinitesimal that it would be like dumping a cocktail in the Detroit River at the foot of Woodward and expecting to get a kick out of the water going over Niagara Falls." The *Free Press* reports that "Doctors said it was something like a molecule, so tiny that it can't be seen, to every 300,000,000 gallons of water." The United States Attorney, it is reported, said that the Koch brothers were arrested after a prolonged investigation. The *Free Press* called attention to the fact that "Dr. Koch was named defendant in a malpractice suit in Detroit in 1934 and a jury returned a \$25,000 verdict against him while he was head of the Koch Cancer Foundation. Later the verdict was held excessive and in a second trial a jury reduced the amount to \$5,500. The suit was started by Alfred A. Fortner, who told the jury Dr. Koch diagnosed an infected knee as a cancer."² The procedure of diagnosing as cancer a condition which is not malignant, and then expediting an effective treatment, is old in cancer quackery. For a number of years Koch has issued promotional material which contained reports of an unscientific character with regard to cases in which his preparations had been employed. More recently he circularized physicians with regard to what he refers to as "1:4 Benzoquinone," claiming, without the slightest bit of scientific reference, as noted in the most recent reference below,³ that it is the effective ingredient in the sulfonamide preparations. Besides Koch there still remain a few other charlatans in the field of cancer who merit federal attention. Perhaps the Koch incident will seem to them a "handwriting on the wall."

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession.

GOVERNMENT TO PAY FOR HOSPITALIZATION OF CIVILIANS INJURED BY ENEMY ACTION

Surgeon General Thomas Parran, U. S. Public Health Service, and Dr. George Baehr, Chief Medical Officer, Office of Civilian Defense, have issued a joint memorandum on details of the program of the government's paying for temporary hospitalization for civilians injured as a result of enemy action. The funds have been allocated to the U. S. Public Health Service from the President's Emergency Fund. The federal government will reimburse all hospitals caring for civilian casualties in the event of air raids or other enemy action at the rate of \$3.75 a day. Any hospital in the nation, voluntary or governmental, may be used as a casualty receiving hospital in the Emergency Medical Service established by the Office of Civilian Defense. Certain institutions in "safe areas" may be used as emergency base hospitals for casualties or other patients whom it may be necessary to evacuate from urban hospitals in exposed areas. For this purpose federally owned equipment may be lent to the base hospital, and their staffs will be supplemented by physicians of the area, who will be commissioned in the reserve corps of the U. S. Public Health Service. The management and control of all such hospitals will remain the responsibility of the local or state authorities. In the establishment of emergency base hospitals, hospitals are now being surveyed and will be classified on a basis of size, equipment and standards of operation.

The organization of medical staffs for base hospitals as units affiliated with casualty hospitals will begin immediately. The physicians and dentists commissioned in the Public Health Service Reserve for service in these hospitals will receive the rank, pay and allowance equivalent to those of the medical corps of the army and will be selected from older age groups, from physicians with disabilities that make them ineligible for military service and from women physicians. They will be assigned to service in regions in which they live as far as possible and will be recruited from the stations of civilian hospitals and cleared through the Procurement and Assignment Service.

DECONTAMINATION OF EYES AFTER EXPOSURE TO LEWISITE AND MUSTARD

The Medical Division of the Office of Civilian Defense, Washington, D. C., submits the following information:

Since publication of the Office of Civilian Defense handbooks "First Aid in the Prevention and Treatment of Chemical Casualties" and "Protection Against Gas," further experience has shown that the 2 per cent solution of hydrogen peroxide recommended for the treatment of eyes following lewisite burns may be injurious if used undiluted. The Chemical Warfare Service now recommends a single instillation in the eyes of a 0.5 per cent solution of hydrogen peroxide as soon as possible after contamination with lewisite. This solution may be prepared by diluting one part of a 2 per cent solution with three parts of water, or one part of a 3 per cent solution with five parts of water. The solution usually found in drug stores is the U. S. P. strength of 2.5 to 3.5 per cent hydrogen peroxide. A 0.5 per cent solution of potassium permanganate has also been found effective as an eye instillation following exposure to lewisite.

In planning decontamination stations, the Medical Division, Office of Civilian Defense, recommends that provision be made near the entrance of the second or shower room for the irrigation of the eyes of contaminated persons. The schematic sketch

of a decontamination station in the Office of Civilian Defense publications mentioned shows the irrigation of eyes in the dressing room, whereas this should be carried out in the second or shower room before the bath is given. Delay until the casualty reaches the dressing room will result in more serious injury to eyes which have been contaminated with mustard gas or lewisite.

PROTECTION OF HOSPITALS

A special committee of the American Hospital Association collaborating with the Medical Division of the Office of Civilian Defense has published in bulletin form "Protection of Hospitals," which had been previously published in hospital journals in order to make its contents immediately available. The Bulletin, No. 3, has diagrams showing how sand bag barricades can be used for temporary reinforcement, tells how to protect windows without cutting off ventilation, describes methods of blackout and has a section on protection against fire in which various types of incendiary bombs and methods of fighting them are described. The bulletin discusses also the protection of patients, personnel and building fabrics, air raid shelters, rescue squads, protection of utilities and facilities for the care of casualties.

THE ARMY NURSE CORPS

The Congress of the United States authorized the formation of the Army Nurse Corps on Feb. 2, 1901. However, women nurses figured in military history of the United States as far back as 1776, and when military surgeons in 1847 were first given rank as officers they were allowed to appoint the nurses required in their individual hospitals and to fix the compensation. Legislation in 1861 gave a definite place to women nurses and fixed their compensation at 40 cents a day and rations. During the Civil War there were 3,214 regularly appointed hospital nurses and in addition an unknown number of unpaid volunteers. They were then under the supervision of Miss Dorothy Dix. Between the Civil War and the Spanish-American War, nursing in the army was done entirely by men. When the United States entered the first world war, the Army Nurse Corps comprised 403 nurses, but within eighteen months the corps had increased to 21,480 nurses, most of whom were reserves called to active service through the American Red Cross; 10,400 of these nurses were sent overseas to serve in England, France, Belgium, Italy and Siberia. They served in various kinds of military hospitals, hospital trains and transports, and even with surgical teams in field hospitals. In 1920, in an amendment to the National Defense Act, Congress provided relative rank for members of the Army Nurse Corps and later retirement for length of service and for disability in line of duty.

To be eligible for an appointment in the Army Nurse Corps, the nurse must be between 22 and 30 years of age, unmarried, a citizen, a graduate of an accredited high school and an approved school of nursing, and a registered nurse, at least 60 inches (152 cm.) in height and of standard weight for her age and height. The commanding generals of the corps areas have authority to appoint nurses. The application must be accompanied by an unmounted autographed photograph taken within the preceding two years and a statement from an official of the high school from which she graduated, giving the date and her numerical place in the class. The physical fitness of the applicant is determined by an examination by a board of medical officers at the nearest army post.

The pay of members of the Army Nurse Corps varies from \$840 a year with maintenance at the start to \$1,380 with main-

tenance after seven to nine years of service, and \$1,560 with maintenance thereafter. Nurses are appointed in the relative rank of second lieutenant, and promotion to the higher grades is determined by length of service, special qualifications and examination. The duties of a nurse in a military hospital are the same as those performed by a nurse in a civil hospital of like character, including night duty. The daily period of duty, as far as practicable, does not exceed eight hours.

A nurse may be retired from active service with pay after thirty years of service or, having reached the age of 50 years, after twenty years of service.

LIAISON OFFICER AT MEDICAL FIELD SERVICE SCHOOL

Lieut. Col. Stanton Higgins, Cavalry, United States Army, has become a member of the faculty of the Medical Field Service School, Carlisle Barracks, Pa., as the first Armored Force liaison officer at this school, instruction in this field previously having been given by an infantry liaison officer. It is important that medical officers know where they fit into the present day complicated war machine and equally essential for liaison officers to understand the medical department's role. Lieutenant Colonel Higgins is a graduate of Yale, was first commissioned in 1917 and served in France in the twenty-sixth cavalry and the First Pursuit Group. He is a graduate of the advance course and the troop officers' course of the cavalry school at Fort Riley, Kan., and the armored force school at Fort Knox, Ky., and was professor of military science and tactics in the high schools of Johnson City, Tenn.

ARMY LIBRARIES

The War Department announced on March 22 that when the national emergency was proclaimed the Army had one hundred and forty-seven permanent libraries. Now it has almost six hundred, containing about two million books on a wide variety of subjects. The new libraries have been combined with the service clubs that have been constructed since the war began, although there are libraries in the old posts and service clubs as well as smaller libraries in hospitals, in company day rooms, outpost stations, antiaircraft batteries and on board transports, and library service is being provided even in combat zones.

The librarians report that new fiction and textbooks on mathematics and radio head the list of "best readers." Camp preferences naturally differ; the Sixth Corps Area (Illinois, Michigan and Wisconsin) likes western novels and Shakespeare's plays. Books on the war are not popular, although at Fort Ord, Calif., Mr. Churchill's "Blood, Sweat and Tears" and "Berlin Diary" are much read.

The primary purpose of camp libraries is to provide recreational reading of fiction; however, there is a growing demand for subject books, histories and biographies. The announcement states that the average soldier in the United States Army is more highly educated than in any other army. Many of the five hundred and sixty-nine thousand volumes in army libraries when the emergency was proclaimed, which were worn out or obsolete, have been discarded and replaced by new books.

BUNDLES FOR BRITAIN

Physicians, hospitals and manufacturers contributed the nearly five thousand used and new surgical instruments and apparatus which were recently shipped to England for distribution to hospitals, Bundles for Britain, Inc., 475 Fifth Avenue, New York, announced on February 24. Equipment which was not in good condition for immediate use when received was reconditioned at the warehouse in New York or by dealers or manufacturers before being packed. The largest single lot in this shipment comprised five hundred and sixty operating instruments for general and special surgical operations and more than six hundred dental instruments; also more than a million tablets of various medicaments. The shipment for insurance purposes was valued at \$10,000 and was made through the American Red Cross.

DRIED BLOOD PLASMA

The Surgeon General of the Army has submitted for publication the following circular letter:

CIRCULAR LETTER NO. 28 (SUPPLY NO. 12)

1. Dried blood plasma is being added to the medical department supply catalogue as standard item 16089 serum, normal human plasma, dried. This dried blood plasma is processed by certain selected manufacturers from blood donated to the American Red Cross. Sources of supply are such that, pending further instructions, this item will be furnished to the following installations only:

- (a) All task, base and overseas forces.
- (b) U. S. Army transports.

2. This item will not be furnished stations within the continental limits of the United States.

3. Liquid plasma centers now in the process of establishment will furnish liquid human plasma for stations within the continental United States. When this liquid plasma is generally available, policies concerning its distribution will be issued from this office by circular letter.

By order of the Surgeon General:

JOHN A. ROGERS,
Colonel, Medical Corps,
Executive Officer.

STATE HOSPITAL OFFICER

The Medical Division of the Office of Civilian Defense has recommended the appointment of a state hospital officer as an official of Emergency Medical Service, particularly in the first, second, third, fourth, eighth and ninth defense regions. The principal function of the hospital officer will be to plan for emergency base hospitals for receiving civilian casualties and other hospital evacuees. His duties will be:

1. To survey the hospitals throughout the state (excluding those in the exposed cities) to determine how many beds can be put into immediate use in emergency with existing kitchen, laundry, sanitation and other engineering facilities. (a) by clearing patients to their homes, (b) by restricting admissions, (c) by use of rooms not normally used for patients, (d) by rehousing medical and nursing staff and other hospital personnel outside the hospital, (e) by use of neighboring buildings (schools, hotels) for patients (or staff), (f) by extra bed accommodation in temporary structures erected on available grounds adjacent to the hospital.

2. To assist in designating for each casualty hospital or group of hospitals in each exposed city (a) the line of evacuation to the base, (b) the transport arrangements, (c) the emergency base hospitals provisionally allotted to each casualty unit.

3. To keep constantly informed of the bed state of every hospital in his area by weekly returns.

4. To advise the Office of Civilian Defense, through the regional medical officer, on the need for providing additional accommodations, e. g. by temporary construction or by converting convalescent homes, hotels, school dormitories or other structures into hospitals.

5. To report to the regional medical officer of the Office of Civilian Defense any exceptional conditions requiring action (e. g. beyond state boundaries or required by the needs of the military situation) and to forward to him copies of a monthly summary report on the state's emergency hospital program. When a hospital outside a state boundary is readily accessible for the reception of casualties from an exposed city, this fact should also be noted.

6. To maintain constant touch with the other service departments of the state defense council (e. g. evacuation).

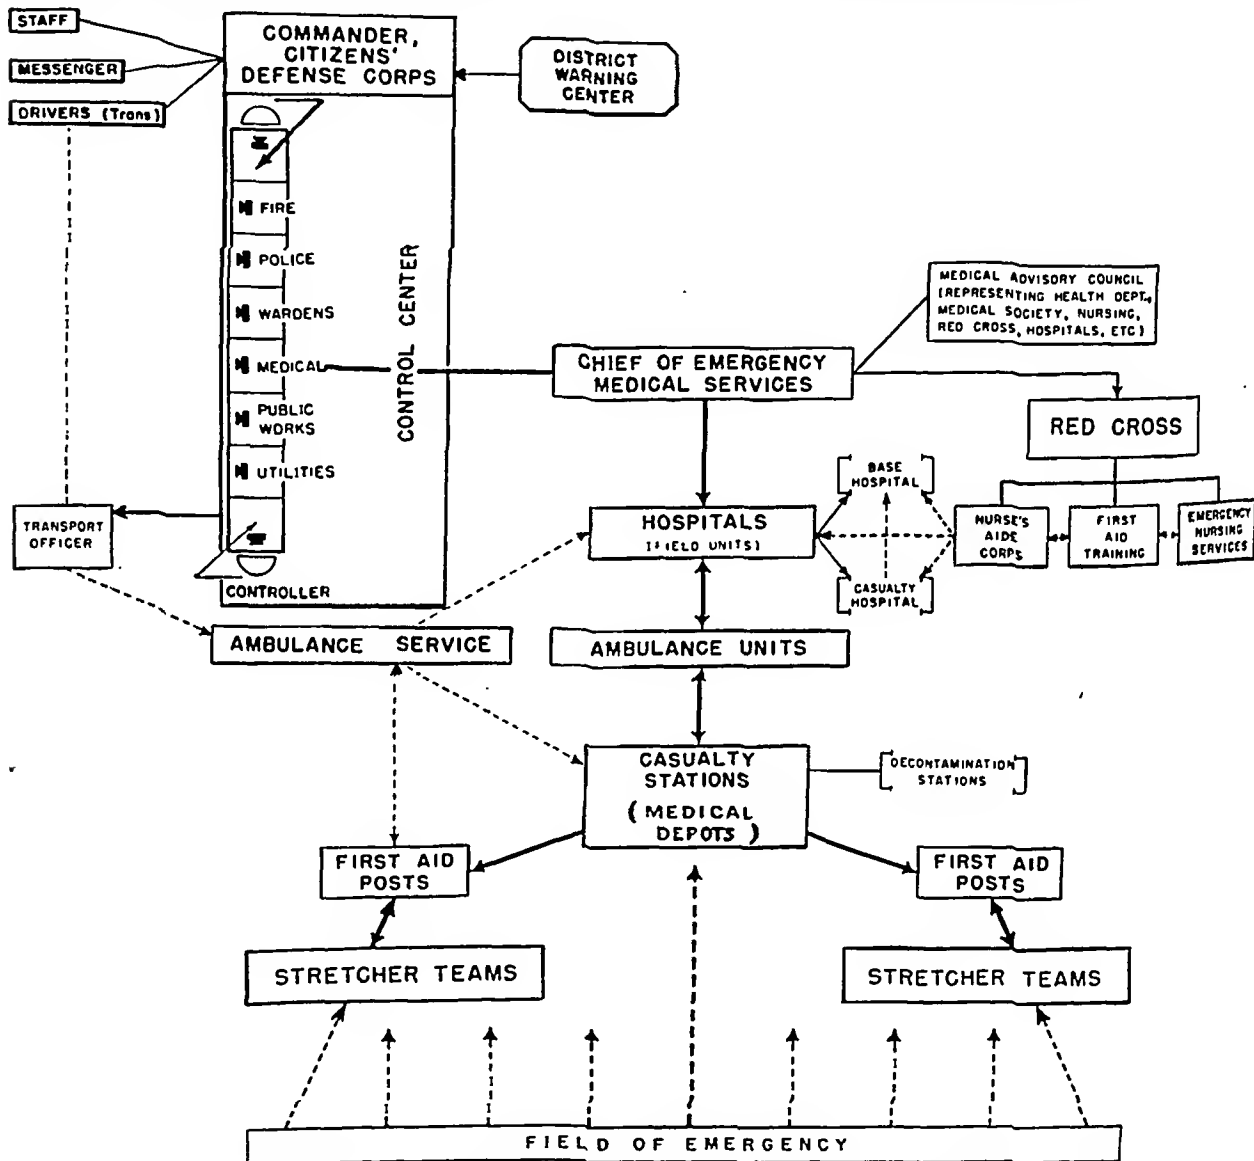

7. To supervise the distribution of medical and hospital supplies under the direction of the state civilian defense property officer and report any threatened deficiency to the regional medical officer.

8. To supervise staff arrangements for emergency base hospitals and for reception areas.

9. To control movements of medical and nursing staff as well as of casualties in any situation affecting emergency base hospitals.

ORGANIZATION OF EMERGENCY MEDICAL SERVICES IN CIVILIAN DEFENSE

Here is the latest design that has been drawn to indicate the organization of medical services for civilian defense. The head of the service is the chief of Emergency Medical Services, who receives his notification directly from the medical representative in the control center. The chief is aided by a medical advisory council, and the Red Cross in time of emergency operates under the chief of Emergency Medical Services as far as concerns the medical aspects of its work and in direct contact with the medical services established in the field of civilian defense.

Organization of local Emergency Medical Services: solid line, line of authority; broken line, line of service.

LECTURES ON WAR EMERGENCIES

The Passaic County (N. J.) Medical Society opened a special course on war emergencies of lectures for physicians and dentists, February 6, with a lecture on "Plan of Emergency Medical Service; Fractures and Traction Splint." The entire group comprised the following topics:

Shock and Hemorrhage, February 13.
Treatment of Burns, February 20.
Blast Lung; Blast Injuries; Methods of Resuscitation, February 27.
War Gases; Germ Warfare, March 6.

The lectures were given at each of the six hospitals in Paterson and Passaic: Paterson General, St. Joseph's and Nathan and Miriam Barnett hospitals, Paterson, and Passaic General, St. Mary's and Beth Israel hospitals in Passaic. The lecturers were chosen from the hospital staffs.

RED CROSS DISASTER RELIEF SQUADRONS

Red Cross chapters throughout the United States are organizing disaster relief squadrons, using either *privately owned* equipment or newly designed mobile units for immediate service in event of a bombing or disaster of any kind. Each squadron is to be equipped with sixteen station wagons, tents, trailers, cots, stretchers and first aid and emergency equipment. New mobile canteens, approved by the WPB, will be available within six weeks. The squadrons are patterned after those of the Boston chapter, first to complete its disaster setup.

SAFETY MEASURES AT WAYNE UNIVERSITY

To insure the safety of students and faculty members at Wayne University, Detroit, in an event of a major emergency the Faculty Advisory Committee on War Related Activities has issued a booklet entitled "The Protection of Wayne University Personnel During the War Emergency." Air raid drills are conducted and at various places first aid stations established and stocked with supplies, cots, blankets and stretchers.

ASSISTANTS TO FLIGHT SURGEONS

A class of enlisted men began a six weeks course of instruction, March 2, at a school of aviation medicine to qualify as flight surgeons' assistants.

ORGANIZATION SECTION

MEDICAL LEGISLATION

STATE MEDICAL LEGISLATION

New Jersey

Bills Introduced.—S. 217 proposes to require every physician, within one week after making a diagnosis of cancer or other malignant tumor under his care, to report the facts to the state department of health. A similar report must be made by the pathologist in any laboratory to which has been submitted a tissue specimen which after examination discloses the existence of these conditions. A similar report must be made by the person in charge of any hospital, clinic, dispensary, nursing home or other similar public or private institution of every case of cancer, malignant tumor or malignant disease of the blood, and lymphatic systems in a patient receiving care or hospitalization at the institution. A. 238, to supplement the medical practice act, proposes to require every person licensed to practice medicine and surgery, or any branch thereof, to register annually with the secretary of the licensing board on or before July 1 and at that time to pay a registration fee of \$3.

New York

Bills Introduced.—S. 1729 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic. The bill proposes to define chiropractic as "the science of locating and the removing of nerve interference in the human body, where such interference is the result of or caused by misalignment or subluxations of the vertebral column. It excludes operative surgery, the reduction of fractures, the prescription or use of drugs or medicine, and the practice of obstetrics." A. 2093, to amend the provisions of the law relating to physiotherapy, proposes to define physiotherapy as "the use of actinotherapy, hydrotherapy, mechanotherapy, thermotherapy, and electrotherapy, exclusive of the x-ray, *including necessary examinations to determine existing conditions that could be treated thereunder.*" Under the present law the definition of physiotherapy is as just stated, excluding the language in italics.

MEDICAL ECONOMIC ABSTRACTS

COLORADO MEDICAL SERVICE READY

The trustees of the Colorado Medical Service, Inc., through its chairman, Dr. J. W. Amesse, announces in the *Denver Medical Bulletin* for February that the organization of the service has been completed and that it will begin operation in the near future. The preliminary work has been greatly assisted by the Colorado Hospital Association. Nearly three hundred members in the state and county societies of Denver have expressed, over their signatures, a desire to see the medical service plan put into execution. The approval of more than 50 per cent of the active membership indicates that the society as a whole wishes to cooperate in a thorough trial of the plan.

The largest single item in the budget, \$5,214,716.86, is expended for the employment of nurses. Other items with the amounts appropriated are:

For nutrition personnel.....	\$249,663.50
For health education personnel.....	160,434.66
For social work personnel.....	44,852.00
Postgraduate education	384,117.52

MEDICAL SERVICE ASSOCIATION IN PENNSYLVANIA

The annual report of the Medical Service Association of Pennsylvania covering fifteen months of operation appears in the *Pennsylvania Medical Journal* (45:433 [Feb.] 1942). This shows assets and liabilities at \$35,700.78 and a balance on hand of \$7,067.45. Subscribers had increased from 972 on Dec. 31, 1940 to 7,163 one year later. A year ago there were only five small groups and today there are twenty-three groups, some of which are of considerable size.

"This rate of growth is not only healthy," says the report, "but one which may prove to be most advantageous to the association. If the rate were much slower, the volume would be so small that a disproportionate share of income would have to be devoted to the costs of administration. On the other hand, when an organization is traveling uncharted seas as the Medical Service Association is, speed—while it might accomplish certain purposes—certainly increases the possibilities of disaster."

While no attempt has been made to enroll participating physicians except in localities in which there are subscribers, the number of participating physicians has increased through the year from 171 to 226. Physicians have received payments for 466 claims totaling \$13,925. For twelve months out of fifteen a unit value of \$2 has been maintained. A large number of tonsillectomies last summer made it necessary to reduce the unit to \$0.80 for June and \$1 for July and August. A debit balance of \$5,242 is carried on the books of the association in favor of the physicians to whom this reduced value of the unit was paid with the expectation that, as the plan grows, it may be possible to make full payment on these accounts. The percentage of the total income applied to administrative costs has fallen quite rapidly, and in the fifth quarter during which the plan was in operation it amounted to 22.8 per cent of the income.

MEDICAL PRACTICE IN CHILDREN'S BUREAU

The extent to which the Children's Bureau, operating under the Social Security Act in the administration of the State Matching Funds section, is concerned in the practice of medicine is strikingly evident in the budget for the fiscal year ending June 30, 1942. The total budget covers the following items:

Purpose of Proposed Expenditures

	Amount *
Total budgeted	\$10,921,602.21
For professional personnel	8,336,041.32
For nonprofessional personnel (including merit-system employees)	1,028,253.10
For postgraduate education	384,117.52
For hospital care	319,496.66
For other purposes	853,693.61

* Annual budgets and supplemental budgets approved up to Sept. 3, 1941; fifty-one states (the term "state" includes Alaska, Hawaii, District of Columbia and Puerto Rico).

The importance of the medical element in the work of the bureau becomes evident when these items are further broken down. The expenditures for medical personnel, which amount to \$2,027,041.32, are divided into \$1,396,312.02 for full time and \$619,355.89 for part time physicians. A total of \$639,062.28 is assigned to dental personnel, of which \$466,566 goes to full time and \$172,496.28 to part time dentists.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Government Finances Research.—Grants totaling nearly two million dollars have been allocated to the University of California, Berkeley, by the United States government for research to further the war effort. All the work is to be of a confidential nature.

Graduates After Accelerated Courses Eligible for Licensure.—The secretary of the board of medical examiners reports that the attorney general of California has advised him that he may accept for licensure applicants who have graduated from an accelerated medical course. The attorney general pointed out that the medical practice act requires that an applicant must have attended four resident courses of instruction, each consisting of not less than thirty-two weeks with a total of four thousand hours of instruction, but such courses need not be pursued continuously or consecutively. The regulation of the time, if any, elapsing between resident courses of instruction, the attorney general said, is a matter to be handled by each approved school.

Annual Heart Meeting.—The California Heart Association will hold its annual meeting at the Hotel Del Monte, May 3. Dr. Wallace M. Yater, professor of medicine, Georgetown University School of Medicine, Washington, D. C., will be the guest speaker. Other speakers will include:

- Drs. James H. Thompson, Francis L. Chamberlain and William J. Kerr, San Francisco, Auricular Flutter in Childhood.
- Dr. Lewis T. Bullock, Los Angeles, The Importance of Age in the Relative Frequency of Various Congenital Cardiac Lesions.
- Dr. Morris H. Nathanson, Los Angeles, Observations on the Rhythmic Property of the Human Heart.
- Dr. Arthur Seizer, San Francisco, Study of the Circulation in Acute Myocardial Infarction.
- Dr. Walter Beckh, San Francisco, A Revaluation of the Serologic Status in Syphilitic Heart Disease.

A number of papers are devoted to electrocardiographic studies. Dr. John Martin Askey, Los Angeles, will present a report on "Carotid Sinus Sensitivity Accidents."

DELAWARE

Dr. Speer Returns as Secretary to State Society.—Dr. William H. Speer, Wilmington, has again been appointed secretary of the Medical Society of Delaware to fill the vacancy that occurred when Dr. Charles Leith Munson went into army service. Dr. Speer previously served as secretary from 1934 to 1937.

DISTRICT OF COLUMBIA

Director of Venereal Disease Unit.—Dr. William E. Graham, formerly with the U. S. Public Health Service, has been appointed director of the division of venereal diseases of the District health department, effective February 5. He graduated at Rush Medical College, University of Chicago, Chicago, in 1932.

Physician Arrested on Narcotic Charge.—Dr. Laurence M. Hynson, Washington, and Mrs. Janie Mae Jacobs were arrested, January 10, and accused of violations of the Harrison Narcotic Act, according to the *Washington Star*. The physician was accused of writing prescriptions for more than 9,000 grains of narcotics in a year for persons not under his direct professional care. The woman was named as a "contact" who procured "patients." The physician, up to March 9, was still in jail because he was unable to produce the \$2,500 bail, it was said.

Prizes for Research.—The Medical Society of the District of Columbia has announced the winners in its first contest to promote postgraduate medical research, newspapers reported on March 26. First prize went to Dr. Roy G. Klepser, assistant resident in surgery at Gallinger Municipal Hospital, for his work on "Problems in the Local Use of Sulfonamides." Second prize to Dr. Ben D. Chinn, medical officer at St. Elizabeths Hospital, for his paper on "Influence of the Bacterial Flora on the Cultivation of *Endameba Histolytica*." Dr. Irving B. Brick won third prize for his work on "Influenzal Meningitis: Evaluation of Treatment and the Use of Sulfadiazine."

Work for Women.—A meeting was held at the Hotel Mayflower in Washington, March 20-21, under the auspices of the Institute for Women's Professional Relations to discuss opportunities in a wartime world for girls who have enjoyed training in specific types of work, according to the *New York Times*. Among the speakers were Dr. Warren F. Draper, assistant surgeon general, U. S. Public Health Service; Dr. Sara M. Jordan, Boston, chairman of the Women's Committee on Defense Assignment and Procurement of the American Medical Association, and Helen S. Mitchell, Ph.D., chief nutritionist, Office of Defense Health and Welfare Service.

GEORGIA

Memorial to Physicians.—Crystal chandeliers have been presented to the Fulton County Medical Society as memorials to the late Dr. Edward C. Davis and the late Dr. Stewart R. Roberts. The one in memory of Dr. Davis came from one of the old homes of Philadelphia. The chandelier in memory of Dr. Roberts is a ten light fixture of Waterford crystal made in 1775. It was formerly the property of Duke De Abernethy, removed from Esher Palace, Esher Surrey, England. Friends and colleagues of both physicians donated the memorials. Dr. Davis was president of the county medical society in 1928 and Dr. Roberts in 1915. The Fulton County Medical Society has a committee on memorials which as time goes on is to decide on suitable memorials to honor its members.

University News.—The University of Georgia School of Medicine, Augusta, has received a grant of \$4,350 for continuation of researches in the venereal diseases under the direction of Dr. Robert B. Greenblatt, professor and head of the department of experimental medicine. Another grant of \$2,000 was received for continuation of the work in nutrition by Dr. Virgil P. W. Sydenstricker, professor of medicine, and his staff. Recent lecturers at the school of medicine include Drs. James Dellinger Barney, Boston, on "A Consideration of Some of the Problems of Renal Stones" and Leopold Clarence Cohn, Baltimore, "Carcinoma of the Female Breast." The former Willenford Hospital for Women and Children at the university has been converted into a tuberculosis hospital and was occupied on February 1. Its capacity is sixty beds. Dr. Lucius N. Dodd, professor of tuberculosis, is in charge. Robert H. Shuler, Ph.D., formerly of the University of Chicago, has been appointed assistant professor of physiology at the school of medicine, Augusta.

ILLINOIS

Increase in Diphtheria.—The state department of health has announced a 10 per cent increase in diphtheria over last year and asks the cooperation of local health officers to augment their local programs of control. Up to April 1, 302 cases had been reported in Illinois this year.

Conference on Delinquency Prevention.—Governor Green has called a three day conference on delinquency prevention at the LaSalle Hotel, Chicago, April 20-22. The theme of the conference will be "Onward with Youth to Good Citizenship" and will be participated in by youth leaders from Illinois and surrounding states.

Survey to Determine Hospital Facilities.—A survey of all hospital facilities in Illinois was started on March 26 to determine the number of hospitals, bed capacities, and possibilities for expansion and to list additional buildings which may be used for temporary hospitals, newspapers announce. The work is under the direction of Dr. Herbert L. Pettitt, Morrison, emergency service medical coordinator for the Illinois Council of Defense.

Welfare Group Reorganized.—The Illinois Conference on Social Welfare recently adopted a new constitution and changed its name to the Illinois Welfare Association. As a part of its reorganization, the association has appointed Mr. Bernard A. Roloff, Chicago, executive secretary. Mr. Roloff for two years had been serving as director of public information of the Illinois Children's Home and Aid Society. The new offices of the association are at 225½ South Fourth Street, Springfield.

Chicago

The Hedblom Lecture.—Dr. Stuart W. Harrington, Rochester, Minn., professor of surgery, University of Minnesota Graduate School, Minneapolis, will give the fifth annual Hedblom Memorial Lecture at the University of Illinois College of Medicine, April 29, on "Diagnosis and Surgical Treatment of Intrathoracic Tumors." The lecture is sponsored by local chapter of Phi Beta Pi Fraternity.

Public Meeting on Cancer.—The Northwest and Irving Park branches of the Chicago Medical Society sponsored a public meeting on March 20 for the consideration of cancer. Dr. David E. W. Wenstrand, Milwaukee, medical director, Northwestern Mutual Life Insurance Company, discussed "The Prevalence of Cancer" and Dr. Arthur C. Christie, professor of clinical radiology, Georgetown University School of Medicine, Washington, D. C., "What Is Being Done to Control Cancer." Dr. Benjamin H. Orndoff, clinical professor of radiology, Loyola University School of Medicine, discussed the papers.

Competition for the Capps Prize.—The Institute of Medicine of Chicago announces that competition is now open for its annual Joseph A. Capps Prize for medical research for "the most meritorious investigation in medicine or in the specialties of medicine." The investigation may also be in the fundamental sciences, provided the work has a definite bearing on some medical problem. Competition is open to graduates of approved Chicago medical schools who completed their internship or one year in laboratory work in 1940 or thereafter. Manuscripts must be submitted to the secretary of the Institute of Medicine of Chicago, 86 East Randolph Street, not later than Dec. 31, 1942.

INDIANA

New Head of Dermatology Department.—Dr. Frank M. Gastineau, Indianapolis, has been appointed head of the department of dermatology and syphilology at the Indiana University School of Medicine, Indianapolis, succeeding Dr. Paul Cregor, who retired. Dr. Gastineau was born in Indianapolis and graduated at the medical school in 1918.

Changes in Health Personnel.—Dr. Richard P. Good has been appointed a member of the Kokomo city board of health.

—Dr. Palmer O. Eichler, Decatur, has been named health officer of Adams County.—Dr. Carl B. McCord, Veedersburg, is the new health officer in Fountain County.—Dr. Charles F. Abell, Marion, has been named city health officer.—Dr. William E. Jenkinson, Mount Vernon, has been appointed in charge of the Posey County health unit, and Dr. William Robert Tipton, Greencastle, in charge of the unit in Putnam County.—Dr. Harley F. Flannigan, Lagrange, has been appointed health commissioner for Lagrange County.

KANSAS

Dr. Porter Resigns as Secretary of State Society.—Dr. John M. Porter, Concordia, who was called to active duty in the U. S. Navy on March 6, has resigned as secretary of the Kansas Medical Society. He was elected to the office in May 1939. Dr. Porter was commissioned lieutenant commander in the navy.

Society News.—A joint meeting of the Kansas Obstetrical and Gynecological Society was addressed in Dodge City, March 20, by Dr. William F. Mengert, Iowa City, on "Consideration of Dystocia and of Practical Methods of Estimating Pelvic Capacity."—The Ford County Medical Society and the Kansas Obstetrical and Gynecological Society was addressed in Dodge City, March 20, by Dr. William F. Mengert, Iowa City, on "A Consideration of Dystocia and of Practical Methods of Estimating Pelvic Capacity."—The Wyandotte County Medical Society was addressed, March 3, by Drs. John A. Billingsley on "Aniseikonia" and Harold V. Holter, "Uses and Abuses of Ovarian Hormones." Both are from Kansas City.

MARYLAND

Graduate Week in Medical History.—The Institute of the History of Medicine, Johns Hopkins University School of Medicine, Baltimore, will hold its third "graduate week in medical history," April 27-May 2, on the theme "Contributions of Greece and Rome to Medicine." The course will consist of lectures, seminars, demonstrations, exhibits and discussions. Dr. Henry E. Sigerist, William H. Welch professor of the history of medicine, and director of the institute of medicine, will deliver the opening address. Other speakers will be:

Dr. Owen Temkin, A Hippocratic Surgeon's Practice, April 28, and Anatomical Demonstrations in Antiquity, April 30.
I. E. Drabkin, Ph.D., A Medical Student in Alexandria, April 29.
Dr. Alan F. Guttmacher, Soranus Makes a Delivery, May 1.
Henry T. Rowell, Ph.D., Hygiene in Every-Day Roman Life, May 2.
There will be seminars on:
Bibliography of Greek and Roman Medical Literature, Dr. Sigerist, April 27.
The Cult of Asclepius, April 28, and Greek and Latin in Medical Terminology, May 1, Dr. Ludwig Edelstein.
Drug Lore and Drug Trade in Greece and Rome, April 30, G. Raynor Thompson, Ph.D.

There will also be exhibits on Medicine in Greece and Rome, Greco-Roman Medical Literature, New Literature on Medical History, Publications of the Institute of the History of Medicine and Permanent Museum of the Institute of the History of Medicine.

MASSACHUSETTS

Course in Industrial Hygiene.—Harvard University School of Public Health, Boston, will conduct a course in industrial hygiene, April 27-August 1. The course is open to physicians and engineers who desire training in this field and covers, among other subjects, sanitary parasitology, ecology, industrial ventilation and air conditioning.

Fifteen Years of Cancer Control.—Since a cancer control program was inaugurated fifteen years ago by the commonwealth of Massachusetts, about 14,000 patients with cancer have attended the cancer clinics. A recent report shows that 40 per cent of the patients are still alive. At the end of ten years, 47 per cent of the patients with cancer of the skin were alive, 23.3 per cent with cancer of the mouth, 21.6 per cent with cancer of the uterus and 15.6 per cent with cancer of the breast. The report states that, as ten years after clinic admission the "dying off curve" for clinic patients is almost identical with that of the Massachusetts population, most of these cases may be considered to be cured. In 1940 physicians referred 80.8 per cent of the patients to the clinics as compared with the 20.1 per cent who were referred in the first year of the program. Between 1927 and 1935 there were 421 physicians who used the tumor diagnostic service; in 1940 there were 798. In the same period the number of specimens increased from 2,813 to 3,907. The report also comments on the remarkable change in attitude of the public toward education; in the early days of the program it was difficult to obtain an audience when cancer was under discussion. Today, members of the cooperative cancer control committees number over ten thousand and have little difficulty in arranging for cancer meetings.

In discussing education of the public in the program, the report stated that the delay between the time of the first recognized symptoms of the disease and the time the patient presents himself to a physician is one measure of judging the effectiveness of a program. In the early years of the program the delay averaged 6.5 months. Between 1936 and 1939 it was 5.3 months and in 1940 was 4.6 months. A similar estimate of the effectiveness of education is the percentage of patients with cancer who go to their physicians within the first month of recognized symptoms. In 1940, 21 per cent of the clinic cancer patients went to their physician within the first month of their symptoms as compared with 15 per cent in the early years of the program.

During the period of the cancer program the actual number of deaths has increased annually by about 2 per cent; the clinic attendance of cancer patients has increased annually about 11 per cent, the number of specimens sent to the diagnostic laboratories about 4.5 per cent, and the admissions to general hospitals about 5 per cent. In 1932, 31.1 per cent of the fatal cases had never been treated in a cancer hospital; in 1940 this figure was 15.8 per cent, indicating that hospitalization for cancer is increasing far more rapidly than the cases of the disease. The report states that the attendance of new cancer patients at the state aided clinics has increased five times as fast as the deaths; only about 8 per cent of the cancer population are seen in the clinics. The other 92 per cent make use of other facilities for diagnosis.

MINNESOTA

Pioneer Veterinarian Retires.—Charles E. Cotton, D.V.M., state pioneer of the bovine tuberculosis campaign, has retired after twenty-two years as executive officer and secretary of the Minnesota State Livestock Sanitary Board. The first tuberculin testing of cattle in Minnesota in 1894 is attributed to Dr. Cotton. Through his efforts and those of the Minneapolis Board of Trade, the legislature was induced to pass a law permitting cities to regulate the production and distribution of milk within their limits. In 1903 when the state livestock sanitary board was established, Dr. Cotton was named a member and in 1918 was chosen head of the board.

Course for Physicians on Kenny Method.—The first continuation course for physicians dealing especially with the Kenny technic for infantile paralysis was completed at the University of Minnesota Center for Continuation Study on April 2. Physicians taking the course included Earl C. Elkins, Rochester; William J. Gardiner, Toronto, Canada; Hyman M. Ginsburg, Fresno, Calif.; Frances A. Hellebrandt, Madison, Wis.; Frank H. Krusen, Rochester; William H. Northway,

San Francisco; Malvin J. Nydahl, Minneapolis; Arthur L. Watkins, Boston, and Bertha W. Weinmann, Chicago. The course occupied a week and included studies of the pathology and general care of infantile paralysis as well as special demonstrations in the Kenny method.

NEW JERSEY

State Medical Meeting in Atlantic City.—The one hundred and seventy-sixth annual convention of the Medical Society of New Jersey will be held at Haddon Hall, Atlantic City, April 21-23, under the presidency of Dr. Thomas K. Lewis, Camden. The speakers will include:

- Dr. John S. Lockwood, Philadelphia, Chemotherapy Under War Time Conditions.
- Dr. Ralph C. Williams, U. S. Public Health Service, Washington, D. C., Public Health in Time of War.
- Dr. Joseph A. Bell, passed assistant surgeon, U. S. Public Health Service, Washington, D. C., Epidemiology in War Time.
- Dr. Frederick R. Hook, captain, M. C., U. S. Navy, Bethesda, Md., Chemotherapy in War Time Surgery.
- Dr. George M. Dorrance, Philadelphia, Plastic Surgery in War Time.
- Dr. Frank C. Yeomans, New York, Stricture of the Rectum.
- Drs. Bernard A. Hirschfield, Trenton, and Anthony S. Tornay and Joseph C. Yaskin, Philadelphia, Spontaneous Subarachnoid Hemorrhage.
- Dr. Meredith F. Campbell, New York, Abdominal Symptoms of Urologic Origin in Children.

One luncheon session will be addressed by Dr. Thaddeus L. Montgomery, Philadelphia, on "Management of the Infertile Pregnant Patient." One panel discussion on acute conditions of the abdomen in infancy will be presented by Drs. Edward J. Donovan, New York, Edward W. Sprague, Newark, and Irvin E. Deibert, Camden. The program also includes a series of scientific motion pictures. The fifteenth session of the woman's auxiliary to the state medical society will be held April 21-23.

NEW YORK

State Medical Meeting in New York.—The Medical Society of the State of New York will hold its annual meeting at the Waldorf-Astoria, New York, April 27-30, under the presidency of Dr. Samuel J. Kopetzky, New York. Included among the speakers will be:

- Dr. William P. Wherry, Omaha, Relations of Faulty Dentition to Deafness.
- Major General James C. Magee, Washington, D. C., Transition of Civilian Doctors to Medical Officers of the Army.
- Col. Leonard G. Rowntree, Washington, Lessons Learned from Physical Examinations of Registrants.
- Dr. George Baehr, Washington, The Physician's Role in the Civilian Defense Program.
- Dr. Henry G. Barbour, New Haven, Conn., Movements of Body Water in Relation to Anesthesia.
- Dr. Martin S. Kleckner, Allentown, Pa., Significance and Interpretation of the Diarrheas Encountered in Proctologic Practice.
- Dr. Jacob Arnold Bargen, Rochester, Minn., Chemotherapy in the Digestive System.
- Dr. Louis Schwartz, Bethesda, Md., Protective Methods for the Prevention of Industrial Dermatoses.
- Dr. Sumner L. S. Koch, Chicago, Tendon and Nerve Injuries.
- Dr. Norman F. Miller, Ann Arbor, Surgery of the Ovary.
- Dr. Virgil G. Casten, Boston, Common Motor Anomalies and Their Treatment.
- Dr. Walter I. Lillie, Philadelphia, A Treatment for Herpes Zoster Ophthalmicus.
- Dr. Francis L. Lederer, Chicago, Otorhinal Deficiencies.
- Dr. Allen F. Voshell, Baltimore, Mechanics of the Knee Joint.
- Dr. Philip Levine, Newark, N. J., The Pathogenesis of Erythroblastosis Fetalis.
- Dr. Henry R. O'Brien, Hartford, Conn., Factors in Obstetrical Care: Report of a Rural Study.
- Dr. Herrman L. Blumgart, Boston, Management of Cardiac Patients Who Require Surgery.
- Dr. Howard F. Root, Boston, Medical Aspects of Diabetic Surgery.
- Dr. James C. McClelland, Toronto, Canada, Relationship of Tuberculosis to Trauma.
- Dr. Walter B. Mount, Montclair, N. J., Alexander Anderson, M.D., 1775-1870, The First Wood Engraver in America.
- Drs. Roy B. Henline, New York, and William P. Yunek Jr., Jersey City, N. J., Scrotal Infections: Their Relationship to Trauma and Compensation.
- Drs. Louis M. Orr and Palmer R. Kundert, Orlando, Fla., Late Results Following Transurethral Prostatic Resection.
- Dr. Charles B. Huggins, Chicago, Endocrine Relationships of Prostatic Cancer.
- Dr. William G. Leaman Jr., Philadelphia, Physical Therapy in Heart Disease.
- Dr. Wilson de Rezende, Rio de Janeiro, Experiments with "Glue Suture" in Repair of Nerve Injury: Description of Technique and Results.
- Miss Elizabeth Kenny, formerly of Australia and recently of Minneapolis, The Technique of the Kenny Treatment of Acute Poliomyelitis.

The program will be divided into general sessions, sectional meetings and symposiums, including one on diseases of the chest, in which Dr. Edgar Mayer, assistant professor of clinical medicine, Cornell University Medical College, will deliver the fourth A. Walter Suiter Lecture on "Advances in Tuberculosis of Importance to the General Practitioner."

New York City

Personal.—Dr. Julius Hass, who formerly occupied the chair in orthopedic surgery at the University of Vienna, has been appointed attending orthopedic surgeon, in charge of the Orthopedic Service, at Montefiore Hospital.

Meeting on Anesthesia.—The regular session of the American Society of Anesthetists, Inc., was held at the Squibb Auditorium, April 9. The speakers included Dr. Henry K. U. Beecher, Boston, on "Possibilities and Limitations of Barbiturates in Anesthesia as Suggested by Experimental Work"; Dr. Frederick M. Allen, "Refrigeration Anesthesia for Limb Operation"; Dr. Samuel A. Thompson, "Asphyxial Resuscitation: The Phenomenon and Its Mechanism," and Dr. George L. Birnbaum, "Comparison of Methods of Resuscitation."

Interest in Healthmobile.—The Brooklyn Tuberculosis and Health Association reports that in the first forty-seven days that the healthmobile was open to the public 37,788 persons, chiefly adults, viewed the fifty-one dioramas, an average of 804 daily. During the eleven days it was shown in the Brooklyn Navy Yard 10,563 civilian employees and enlisted men viewed the exhibit. It is planned to show the healthmobile as a part of the scientific exhibit at the annual meeting of the National Tuberculosis Association in Philadelphia May 4-9.

Report of Museum of Health.—Plans are under consideration to establish the American Museum of Health in a wing of the American Museum of Natural History, New York, according to a report of the museum's activities of the past year. More than three hundred thousand people have seen the museum's exhibits since the close of the fair in 1940. Through its exhibit loan program, museum materials were displayed by fourteen organizations in twelve cities in the past year. The report also announces the forthcoming publication of the first report on the Visitor Reaction Study conducted by the museum and the U. S. Public Health Service, under a grant of the Carnegie Corporation, New York, entitled "What the Public Knows About Health" comprising a compilation of the results of the health knowledge tests given at the New York World's Fair and the San Francisco Golden Gate Exposition. Recently elected members of the board of directors include John A. Marcuse, Basil O'Connor, New York, and Edwin A. Salmon. Mr. O'Connor was elected treasurer of the museum. Plans are now going forward to hold a meeting of the American Museum of Health on April 27.

NORTH CAROLINA

Internships and the Accelerated Program.—In order to cooperate with the accelerated medical school program, the Duke Hospital internships of twelve months in the various services will commence on July 1, 1942, April 1, 1943, Jan. 1, 1944, Oct. 1, 1944 and July 1, 1945. This schedule will provide an overlapping in internships for a period of three months, during which the preceding group will be senior interns. Applications should be sent to the superintendent six months before these dates.

PENNSYLVANIA

Meeting of Ophthalmologists.—A joint meeting of the Wilkes-Barre, Southern Anthracite and Reading Eye, Ear, Nose and Throat societies will be held at the Schuylkill Country Club near Pottsville, April 29, with a view to forming the Eastern Pennsylvania Association of Eye, Ear, Nose and Throat societies. The following scientific program has been arranged:

- Dr. Benjamin F. Souders, Reading, Ocular Absorption of Certain Sulfonamides.
- Dr. Thomas R. Gagon, Pittston, Ocular Signs of Myasthenia Gravis and the Prostigmine Test.
- Dr. Horace J. Williams, Philadelphia, Ménière's Disease.
- Dr. Douglas MacFarlan, Philadelphia, Deafness.
- Dr. Algernon B. Reese, New York, Practical Ophthalmological Therapeutics.

Dr. Lewis T. Buckman, Wilkes-Barre, is temporary chairman of the proposed group and Dr. James E. Landis, Reading, temporary secretary.

Philadelphia

De Schweinitz Memorial Library.—Plans are under way to equip a library in the University Hospital in honor of the late Dr. George E. de Schweinitz, professor emeritus of ophthalmology, University of Pennsylvania School of Medicine. Friends of Dr. de Schweinitz have undertaken to finance the project. Any one wishing to contribute may address Mr. Edmund R. Purves, chairman of the committee, at the University Hospital.

Dr. Ruth Weaver Succeeds Dr. Martha Tracy.—Dr. Ruth Hartley Weaver, registrar of vital statistics of Philadelphia, has been appointed assistant director of health to succeed the late Dr. Martha Tracy. Dr. Weaver graduated at Woman's Medical College of Pennsylvania in 1917 and was an instructor in surgery there from 1919 to 1925. She has served as epidemiologist of the city department of health and is at present assistant professor of epidemiology and vital statistics, Temple University School of Medicine.

RHODE ISLAND

Health Institute.—The twelfth New England Health Institute will be held at the Biltmore Hotel, Providence, April 21-23. Dr. Thomas Parran, Washington, D. C., surgeon general, U. S. Public Health Service, will give the principal address, and Mark D. Elliot, D.D.S., Boston, will address a luncheon meeting of the Rhode Island Nutrition Association and the Rhode Island Dental Society on "Nutrition and Dental Health."

WASHINGTON

Medical Round Table of the Air.—Station KIRO, Seattle, and the King County Medical Society are cooperating in a weekly program entitled "Medical Round Table of the Air." The series opened on April 9 and featured a panel of physicians to discuss medical developments of current interests particularly from the standard of their effects on physical fitness. A question of the week will be chosen from among those received from listeners. The names of the physicians are not mentioned on the broadcast nor in any of the general public releases.

PUERTO RICO

Report of School of Tropical Medicine.—A report has been issued concerning the activities of the School of Tropical Medicine, San Juan. Teaching started in the department of public health on Feb. 17, 1941. This department will confine its work to the training personnel for administrative and field duties within the Insular Health Department. A sum of \$65,000 had been apportioned under the National Security Act to maintain an educational program under the direction of this department. The library, which was expanded, was moved into a new building at the close of the calendar year.

Legislative action of May 1, 1940 set aside the University Hospital as a diagnostic and research unit, cooperating with the district hospitals of the Insular Health Department in the study and investigation of tropical diseases. During the year ended June 30, 1941 the hospital admitted 688 patients for medical attention. Forty children were treated in the children's ward, recently opened through the gift of \$2,000 of the Rotary Club of San Juan. A total of 16,998 outpatients were treated. Of the two hundred and fifteen operations performed, one hundred and one were on charity patients; one hundred and forty-one blood transfusions were given. The report treats the many problems of research carried on in the various departments of the schools, bringing the many activities up to date.

Dr. George W. Bachman, director of the School of Tropical Medicine, recommends that the school be given a permanent operating budget; this lack he says explains why no promotions have been extended to the full time faculty members. The school has grown from an organization which could be supported on a yearly budget of \$30,500 in 1926 to one that now requires an annual maintenance appropriation of \$276,747.

GENERAL

Meeting of Psychoanalysis Association.—The meeting of the Association for the Advancement of Psychoanalysis will be held at the Copley-Plaza Hotel, Boston, May 19. The morning session will be devoted to a panel discussion on human destructiveness. The speakers at the afternoon session will include the following New York physicians:

Dr. William V. Silverberg, Psychoanalysis, Religion and World Crisis.
Dr. Bernard S. Robbins, Evolution of the Neurotic Present from the Traumatic Past.

Dr. Karen Horney, The Role of Unconscious Arrogance in Neurosis.
Dr. Judah Marmor, The Role of Instincts in Human Behavior.
Dr. Clara M. Thompson, What Is Penis Envy?

Annals of Surgery to Appear in Spanish.—Beginning with the June issue, *Annals of Surgery* will henceforth appear also in a Spanish edition. This arrangement was a result of negotiations of the Coordinator on Inter-American Affairs. Mr. Lewis Hanke, director of the Hispanic Foundation, Guillermo Kraft Company, one of the oldest publishing firms in Buenos Aires, will translate the *Annals of Surgery* each month for South American physicians and surgeons. The editorial board

of the journal, of which Dr. Walter E. Lee, Philadelphia, is chairman, will cooperate with Latin American physicians in the new project.

Association for the Study of Neoplastic Diseases.—The spring meeting of the American Association for the Study of Neoplastic Diseases will be held in the Bowman Gray School of Medicine, Wake Forest College School of Medical Sciences, Winston-Salem, N. C., April 23-25. The Robert E. Lec Hotel, Winston-Salem, will be the headquarters. The following subjects will be covered: tumors of the soft parts and miscellaneous tumors, intrathoracic tumors, tumors of bone, tumors of the female generative organs, tumors of the breast and tumors of the gastrointestinal tract. The summer meeting of the association will be held at the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, June 25-27, with Dr. Grant E. Ward, Baltimore, in charge.

American Federation for Clinical Research.—The first annual meeting of the American Federation for Clinical Research will be held at the Center for Continuation Study, University of Minnesota, Minneapolis, April 20-21. Among the speakers will be:

Drs. Henry N. Harkins and Conrad R. Lam, Detroit, Quantitative Studies on Plasma Therapy in Severe Burns.

Dr. Edward C. Reifstein Jr., Syracuse, N. Y., The Effect of Gonadal Hormones on Senile Osteoporosis.

Drs. Carl G. Morlock and Byron E. Hall, Rochester, Minn., The Association of Hepatic Cirrhosis, Thrombocytopenia and Hemorrhagic Tendency.

Dr. John A. Anderson, Minneapolis, The Antagonism of Adrenal Cortical Extract to Pitressin in Human Diabetes Insipidus.

Dr. Irving Greenfield, Brooklyn, Thrombosis of the Abdominal Aorta.

Drs. Fuller Albright, Patricia H. Smith and Russell Fraser, Boston, Short Stature Associated with Congenital Hypoplasia of the Ovaries.

Dr. Nahum J. Winer, New York, Renal Function in Diabetes Insipidus.

Dr. Willis E. Brown and Violet M. Wilder, Ph.D., Omaha, Response of the Human Uterus to Adrenalin.

Five Day Cure for Gonorrhea.—For the first time, a five day cure for gonorrhea has been perfected and proved in large scale tests, Surg. Gen. Thomas Parran of the U. S. Public Health Service announces. Sulfathiazole is now credited with the cure of at least 80 per cent of all gonorrheal infections. Of the remaining 20 per cent, many may be cured by another course of treatment with the same drug or by other special methods. The surgeon general's announcement coincides with the appearance of an article describing the five day treatment in *Veneral Disease Information*, published by the service. Entitled "The Management of Gonorrhea in General Practice," the article was prepared by the executive committee of the American Neisserian Medical Society. Originally developed in the venereal disease research laboratory of the public health service, the cure has been confirmed by tests on thousands of patients in medical centers and is being recommended for routine use by the medical profession.

Meeting of Health Officers.—Dr. Carl V. Reynolds, Raleigh, secretary and state health officer of the North Carolina State Board of Health, was elected president of the State, Territorial and Provincial Health Authorities of North America at the recent meeting in Washington, succeeding Dr. Frederick W. Jackson, deputy minister of health, Winnipeg, Man. Other officers are Drs. Gregoire F. Amyot, provincial health officer, Victoria, B. C., vice president, and Albert J. Chesley, Minneapolis, secretary and executive officer, Minnesota Department of Health, who was reelected secretary and treasurer for his eighteenth term. Following a meeting with the U. S. Children's Bureau a new organization was formed composed of state and territorial health officers of the United States and its possessions to act as a clearing house on matters of federal import relating to the various states and territories. The regular association had met earlier with the U. S. Public Health Service to hear, among others, addresses by Dr. Thomas Parran, surgeon general of the service, and Paul V. McNutt, administrator, Federal Security Agency, on "Health Agencies, Their Responsibilities and Their Opportunities During the Present Crisis."

Annual Exhibit of Physician's Art Association.—The fifth annual exhibit of the American Physician's Art Association will be held at Atlantic City, N. J., June 8-12. The gallery will be on the main floor of the auditorium. The secretary of the art association, Dr. Francis H. Redewill, has sent entry blanks to members giving details of the kind of art pieces that will be exhibited and how to send them. Dr. Redewill's address during the annual meeting will be the Hotel Claridge, Atlantic City, where all exhibitors should send their pieces express collect to arrive between June 1 and June 6. Through the courtesy of Mead Johnson & Co., Evansville, Ind., there will be no fees for hanging and no express charges

either way. The type of art to be exhibited includes personal work of the following types of medium: oil portraits, oil still life, landscapes, sculpture, water color, pastels, etchings, photography, wood carving, leather tooling, ceramics and tapestries (needle work). All pieces should be sent preferably by railway express collect, automatically covered with \$50 insurance. The dues of the American Physician's Art Association after March 1, 1942 are \$2. However, those who paid their \$1 dues prior to March 1 will be eligible to exhibit. Mead Johnson & Co. has published a book containing photographs of art work done by six hundred physicians, a copy of which will be mailed gratis to every member of the American Physician's Art Association in a short time. Exhibitors should send now for entry blanks to Dr. Redewill in the Flood Building, San Francisco, one of which should be used for each medium in which it is desired to exhibit. There is a charge of \$1 for each extra medium. Only two pieces of art are allowed in each type of medium. The prizes offered will include more than fifty trophies, twenty-five medals and six plaques.

FOREIGN

Soviet Doctors Use American Methods.—Dr. B. A. Petrov, chief surgeon of the Black Sea Fleet of the Soviet Union, in an intercontinental news dispatch from Moscow is reported to have said that the application of American surgical technics by Russian doctors are bringing highly gratifying results. Soviet field surgery, he said, now applies a cast directly on the open wound. The favorable action is rapid, makes for rest of the wound and the fracture, facilitates the removal of the patient, and effects tremendous saving in dressing materials. Dr. Petrov stated that 70 per cent of the wounds in naval battles are wounds of the extremities. He referred particularly to the plaster cast technic developed by Dr. H. Winnett Orr of Lincoln, Neb. Dr. Orr's book "Trueta's Treatment of War Wounds and Fractures" is one of a list that Russian doctors have requested.

Dr. Petrov pointed out that burns of the extremities and of the face and body were more frequent in the navy than in the army and "as a basic means of the treatment of such wounds we have adopted the method of the American physician Batman, which has produced excellent results."

Russian War Relief, Inc., 535 Fifth Avenue, New York City, endeavors to supply Soviet medical authorities with information about the latest American medical advances.

Public Health Under Hitler's Rule.—The following items have been collected from various sources:

Smallpox has been reported in the Paris area, and the Academy of Medicine has urged the people to have themselves revaccinated, according to Radio Lyons.

The official report of the Budapest health officer states that during January there were 4 cases of typhus in Budapest, according to the *Deutsche Zeitung*, Budapest. The burgomaster of Aalborg insists there are no lice in his community and refuses to take precautions against typhus, declaring that the medical officer's methods of investigations are illegal, according to the Göteborgs *Handels-och Sjöfartstidning*. The meeting of the district medical officers at Copenhagen decided that the need for delousing centers is not pressing, but the Ministry of Health is prepared to act at short notice.

According to the *Paris Soir*, the comité nationale de l'enfance has submitted a report to the Academy of Medicine of Paris, stating that emaciation and an increase in tuberculosis are prevalent among the population in the occupied zone as a result of food restrictions.

Twelve persons were seriously "poisoned" by meat in Miskole, according to the *Deutsche Zeitung*, Budapest. The illness was traced to sausage sold by a butcher named Augustini. The authorities made an investigation to determine whether the meat came from a diseased animal clandestinely slaughtered. The chief physician of the Elisabeth Hospital established that the cause of the illness was "paratyphoid infection." This announcement caused great anxiety in Miskole, as a number of families had bought meat from this butcher.

The Croat minister of public health, according to the *Neues Wiener Tagblatt*, in an address at the annual meeting of Croat physicians, pointed out that the Croat state is confronted with an impossible public health situation, as in the whole of Croatia there are only fifteen hundred physicians, less than in the old Croatia before the war of 1914-1918.

All persons of Jewish descent in Bulgaria who belong to the medical, dental and pharmaceutical professions and who no longer can follow their profession in urban areas will, according to *Transocean*, now be settled in rural districts, under the law of civilian mobilization, where there is a shortage of doctors and pharmacists.

In an article in the *Deutsche Allgemeine Zeitung* the death rate among infants is said to be favorable in Germany, although measures must be taken to reach still better figures. A center for collecting mother's milk is to be created in Gau Essen.

Paris had 2,270,253 inhabitants on January 8, according to Havas, as compared with 1,051,506 in 1940 and 2,824,746 in 1936. The total number of people in the department of the Seine is 4,136,614.

The reich youth leader, Axmann, addressed the Hitler youth leaders in Berlin and said, according to DNB, that during 1942 the Hitler youth would pay particular attention to securing candidates for the army medical corps and will increase its efforts in caring for the welfare of the soldiers and for the next of kin of those killed. Axmann is reported to have said that all the Hitler youth leaders fit for service were now with the forces and the practical work in this organization was now being done by the younger and subordinate elements of the corps. All the other activities of the Hitler youth would be of the kind dictated by the necessities of the war. Axmann stated that service in the East is now the most important task.

Government Services

General Dunham to Go to Ecuador

Brigadier General George C. Dunham, Medical Corps, U. S. Army, has been appointed director of a new division of health and sanitation in the Office of Inter-American Affairs. General Dunham will be placed at the head of a mission which is going to Ecuador to undertake malaria control, improvement of sewage disposal and other sanitary measures in cooperation with the Ecuadorean government. According to *Science*, members of the mission will include Dr. Walter C. Earle of the International Health Division of the Rockefeller Foundation and recently health officer of the Champaign-Urbana (Ill.) health district. General Dunham was chief of the division of preventive medicine, Office of the Surgeon General, War Department, from 1922 to 1925; director, military sanitation, medical field service school, Carlisle Barracks, Pennsylvania, 1926-1931; technical adviser of public health to the governor general of the Philippine Islands, 1931-1935, and director of laboratories of the Army Medical School since 1936.

Health of the Army

A new low death rate per thousand strength for the U. S. Army was established in 1940. According to the annual report of the surgeon general, there were 257,136 admissions to sick report from all causes, giving an annual rate per thousand of 763.3, an increase of 44 per cent over that for 1939, which was the lowest on record. Diseases of the respiratory system were responsible for the largest number of admissions. In second place were infectious diseases and conditions of the digestive system. There were 267 admissions with one hundred and eight deaths due to aircraft accidents in 1940, and thirty-two deaths from accidental drowning. The admission rate for venereal diseases for the whole army was 42.5 per thousand strength. The number of days lost from duty due to venereal disease was 456,148. The average number of men absent from duty each day from this cause was 1,246. The average length of treatment in hospitals or quarters for all venereal diseases was thirty-two days. The average number of days lost per case for syphilis was twenty-eight, for gonorrhea thirty-five and for other venereal diseases twenty. Gonorrhea continued to lead the causes of noneffectiveness. During the year, 1.39 per cent of the strength of the army was lost by discharge or retirement for physical disability. Dementia praecox was the leading cause for first charge. Manic depressive psychoses also appeared for the first time among the leading causes. Tuberculosis as a leading cause of death reached a new low and is near the bottom of the list. There were 229 deaths attributed to motor vehicle accidents.

During the fiscal year 1941 the average number of men present daily in the Civilian Conservation Corps was 243,926, a reduction of 22,252 from the preceding year. Of the 337,343 admitted to sick report during the year, 316,758 were for disease and 20,612 for injuries. This was the smallest total for injuries in any one year since the inception of the corps in 1933. There were 521 deaths, of which 248 were attributed to injuries and 273 to disease.

On Jan. 2, 1941 the Office of the Surgeon General, except the Army Medical Museum and the Army Medical Library, was moved from War Department Annex Number 1 into a portion of the Social Security Building.

Health Conditions in Germany

Information as to health conditions in Germany is difficult to obtain. The press is rigidly controlled, and truth is not only suppressed but replaced by any fiction which is thought to be helpful. However, leakage will occur. Few German medical journals come to this country now, but the *Times* is able to quote from information showing that undernourishment and fatigue are beginning to tell on the population. In a copy of the *Münchener medizinische Wochenschrift* the date of which is not given, Dr. G. Seiffert sets out to prove that precautions suggested by previous wars kept epidemics under control until the outbreak of the conflict on the eastern front, but his figures suggest the opposite. Cases of diphtheria during the first five weeks of 1931 numbered 25,144; in 1939, 65,144; in 1941, 65,775. For scarlet fever the figures were in 1931, 19,494; in 1940, 56,154; in 1941, 167,428. For dysentery, 1931, 2,596; 1939, 6,135; 1940, 12,705. Similar increases are shown for whooping cough, tuberculosis and food poisoning. The average number of cases of disease given in 1931 is increased threefold in 1939 and sixfold in 1941.

The *Deutsche medizinische Wochenschrift* devotes the major part of two December issues to the effects of prolonged fatigue on health. It states that only relaxation can remove the effects, often far reaching, of sustained fatigue. All attempts to do so by stimulant drugs, such as amphetamine sulfate, have utterly failed. Increasing observations that the use of such drugs has not only produced total collapse but inculcated drug habits is strengthening the resolve of physicians not to use them for combating fatigue.

Report on the Public Health

The reports on the public health continue good in spite of war conditions. Sir William Jameson, chief medical officer of the Ministry of Health, states that there is no indication of an influenza epidemic, although it is too early to say that we shall completely escape. In the one hundred and twenty-six large cities of England and Wales the deaths recorded from influenza in the week ended January 3 numbered only three, compared with fifty-three last year. The measles epidemic, which raged last year, has almost disappeared. The cases notified during that week numbered 926, compared with 17,853 last year. Decreases are also recorded in notifications of scarlet fever, diphtheria, pneumonia, cerebrospinal fever and whooping cough. Jameson advises all mothers of infants to take advantage of the black currant preparations made available through maternity and child welfare centers and food offices. There is black currant juice for infants up to 6 months and black currant purée for those from 6 months to 2 years of age.

Reduction of Rationed Foods

In a broadcast the minister of food, Lord Woolton, said that our food position was so strong that he had been able to grant a winter bonus of rationed foods. But a new factor had arisen: the war with Japan. Much of our food had been coming across the Pacific Ocean. Ships that brought us food must now carry men and munitions to new places far over the seas, and we should have to manage with smaller imports for a time. We could for a time live on our present rations, but it would not be wise. It would be much more comfortable to cut our rations a bit and know that there was safety behind them. The weekly rations of the following goods are now reduced to the level

before an increase recently granted: sugar 8 ounces, butter and margarine 6 ounces, of which not more than 2 ounces may be butter; cooking fat 2 ounces. The cheese weekly ration will be reduced from 3 to 2 ounces. For the present a bigger ration will be allowed to certain classes of workers, and the ration for vegetarians and the diabetic will not be reduced.

The Increased Use of Canned Foods

One of the most important dietetic changes brought about by the war is an increased use of canned foods. The Ministries of Food and Health have therefore made a joint announcement on these foods. They state that canned food compares favorably with cooked food. Articles for canning are selected with care and are canned almost at once before they have lost any of their nutritive value. Processing or sterilization is done with scientific care and less loss of nutritive value than in cooking on an open range. Chemically there is little risk of contamination with tin. Articles, such as acid fruits, which might attack tin are packed in lacquered cans, which give a high degree of protection. Little or no solder is now used to seal food cans. Bacteriologically, canned is less likely to be infected than fresh food. It is handled less, as most of the preparation is done by machinery, and it is sterilized after packing in the tin.

The life of canned foods varies with the article, the presence or absence of protective internal lacquer, and the temperature and humidity of the place of storage. The last acts only by producing rusting and eventually perforation of the tin. One year is given as the usual period for the storage of canned soft stoned fruits in a cool place. After that the food value is not impaired but the pack may appear less attractive and the natural acidity of the fruit may attack any scratched or damaged parts of the lacquer. Honey or jam should keep at least three years in lacquered cans. Vegetables store well for at least two years. They then become less attractive, but their food value remains unchanged. Fish, especially sardines and salmon, keep for over five years. So do meat packs (sausages, meat rolls, galantine, tongues, soups). Canned hams present a special problem; the packer usually guarantees them for only six months. But if after longer storage the can is not bulged, the contents are usually sound. Condensed milk keeps for varying periods according to the sugar content. Unsweetened condensed milk keeps for three years, sweetened full cream for six to nine months, after which the sugar may crystallize, but this is in no way objectionable. Dry milk powder should be used within a few weeks.

Increase of Professional Fees

An inevitable result of war is increased prices, resulting in the first instance in scarcity of certain commodities resulting from diversion of industry into war channels. An effect of the increased cost of living is a demand by organized workers for an increased wage to meet this. The increased wage leads to a further increase in the cost of living. This process is known as inflation, and the government, which now controls the whole economy of the country, says that it is anxious to avoid this. Nevertheless it has been responsible for a good many increases in wages. If the process does not go too far we can stand it, as we can other evils. The General Practice Committee of the British Medical Association has recommended that the fees in private practice be increased by 20 per cent. Certain insurance companies have already increased from \$5 to \$6 the fee for life insurance examinations. The committee has decided to make representations to companies which have not yet taken this course. It has also decided to advise branches and divisions to secure readjustment of the salaries of district medical officers in view of the additional work in many areas and increased practice expenses. A wartime increase in the fees of public

vaccinators is also advised and an application for the same increase in the fees of police surgeons. For medical officers of fire departments a fee of \$2.50 is advised for medical examination of entrants and for rendering first aid to persons injured at fires, if the attendance did not exceed half an hour.

Use of Glass and Resins in Rebuilding Houses

In consequence of destruction by air raids there will be a good deal of rebuilding after the war, and improved forms of construction are already being discussed. In a lecture on "The Postwar Home: Its Interior and Equipment," Dr. E. Frankland Armstrong said that glass would soon be more widely used as a building material. There were toughened varieties at which stones could be thrown with impunity, and window glass which cut out the heat rays but admitted the health giving ultraviolet rays of the sun. Transparent synthetic resins would also supplant glass.

MEXICO CITY

(From Our Regular Correspondent)

Feb. 20, 1942.

Tuberculosis in Mexico

The prevalence of tuberculosis in Mexico can be roughly estimated only through the available figures regarding its mortality. The tuberculosis death rate, including all forms of the disease, was 78.83 per hundred thousand in 1922, 68.71 in 1930 and 55.38 in 1938. Notification of cases to public health authorities is quite deficient, but it is believed that an average of 120,000 to 150,000 cases of all forms of tuberculosis exist, and that about 10 per cent of them are in the Federal District. Tuberculosis is more prevalent in the crowded districts of the cities than in the rural areas, although in places located on the coast and in the tropical zones, owing to the presence of malaria, hookworm disease, undernourishment and other ailments, the disease is widespread. In the mining districts in Pachuca City, Hidalgo, Guanajuato City, Guanajuato, and others, the presence of silicosis increases the infection. In the cities and ports of Tampico and Veracruz on the Gulf Coast and Mazatlán on the Pacific, the mortality rate is as high as 500 per hundred thousand. Along the northern border, especially in Nuevo Laredo and Matamoros, Tamaulipas, and Nogales, Sonora, the number of cases is high because of the large number of cases deported. The statistics of the sanatorium of Huipulco show that 68 per cent of patients arrive with bilateral lesions and that 50 per cent of the patients show cavities when entering. In addition to overfeeding the surgical treatment is the most used. The ambulatory treatment of patients with mild types of tuberculosis is extensively used in Mexico with a long rest in their homes supervised by specialized nurses.

During the last ten years several measures to fight against tuberculosis have been taken by the Division of Tuberculosis in the Federal Department of Health, the Department of Public Assistance and the National Tuberculosis Committee. The number of beds for tuberculous patients in official institutions in Mexico amount to less than one thousand beds plus over one hundred in private hospitals. In the last six years the number of tuberculosis clinics has increased. There are eight in the Federal District and twenty-five scattered in the most stricken areas over the nation. A preventorium for children, supported by the Department of Public Education, with fifty beds is located in one of the suburbs of Mexico City. The Departments of Labor and Agriculture are doing their share in improving working conditions and encouraging proper feeding among people living in rural areas. During 1941 the National Tuberculosis Committee started a drive to raise funds which was followed by unexpected success, because in a short time the committee was able to collect about \$750,000 and the bureau of finances of the committee is studying the possibility of raising funds regularly, through the sale of a stamp and by a sort

of social security against the disease. Dr. Víctor Fernández Manero, federal director of health, appointed Dr. Neftalí Rodríguez as chief of the division of tuberculosis, who was elected also president of the national tuberculosis committee. Licenciado Aarón Sáenz was elected treasurer general and Dr. Alejandro Berges executive secretary of the committee. The program for the present year includes the building of a sanatorium for children, hospitals for advanced cases, a preventorium and a rehabilitation farm in the Federal District, and two more sanatoriums on the Gulf and Pacific coasts, at a cost of about \$1,000,000, with which there will be about two thousand more beds available.

Department of Health Manufactures Biologic Preparations

Chemists and bacteriologists working in the Institute of Hygiene of the Federal Department of Health have been increasing the manufacture of biologic preparations, chemicals and medicines to prevent the shortage of such products. Biologic preparations manufactured by the Institute of Hygiene are identical to the foreign ones used before the present situation developed, and the cost is much lower. Officials think that production can be increased for exportation. The Federal Department of Health through the Department of Economics has bought another ton of quinine to be distributed in the malaria zones. In a laboratory recently opened in Guatimoc, Chiapas, in which the cinchona plantation is located, the manufacture of quinine products as an experiment has started. President Camacho has issued an order that all cinchona trees and plantations must be in charge of the Federal Department of Health.

Hospital Program in Mexico

According to a broadcast made by Dr. Gustavo Baz, minister of public assistance, last Sunday the federal government during the present year will encourage the building of hospitals in all large cities, the improvement of hospital and laboratory equipment all over the country and the building of a big medical center in Mexico City with all modern facilities for patients coming to the capital for treatment. Dr. Baz announced also that during the year work will be started on the Children's Hospital, the Mundet Maternity Hospital, the Infectious Disease Hospital, the Dental Institute and the Civil Hospitals of Monterrey, Tampico, Mazatlan and Juquilpan, besides clinics in Veracruz, Puebla, Tuxtla Gutierrez, San Luis Potosi and Sonora.

Marriages

SIMON EUGENE DRISKELL to Miss Tallulah Scruggs Turner, both of Jacksonville, Fla., in St. Augustine, February 20

LEIGH FESTUS WATSON, Los Angeles, to Miss Pepita La Mone of Hollywood, Calif., in New York, January 6.

CREIGHTON WRENN, Mooresville, N. C., to Miss Charlotte Hutson Martin of Charlotte, February 17.

WILLIAM EDWIN DICKERSON, Danville, Va., to Mrs. Cecil May Graeter of Richmond, January 3.

SOLOMON TANENBAUM, Augusta, Ga., to Miss Esther Ann Cordish of Baltimore, January 18.

CHARLES D. SCHILLING, Charlottesville, Va., to Miss Alice Thompson of Gretna, January 10.

EPHRAIM E. CAMP, Russellville, Ky., to Miss Ruth Bonham of Dresden, Ohio, January 25.

GEORGE HOLLANDER to Dr. BEATRICE ELSIE STERLING, both of Philadelphia, January 25.

BYRON Z. BINNS, Monticello, Ark., to Miss Pauline Berry at Benton, January 17.

IVAN ISAACS, New York, to Miss Lola Hortense Schain of Brooklyn, February 11.

ROBERT H. ROBBINS, Waukegan, Ill., to Miss Rachel Eglert of Urbana recently.

Deaths

Frank Leech * Washington, D. C.; Columbian University Medical Department, Washington, 1891; formerly clinical professor of medicine at his alma mater, now known as the George Washington University School of Medicine; served during World War I; lieutenant colonel, Medical Reserve, U. S. Army; past president of the Medical Society of the District of Columbia and of the Clinico-Pathological Society of Washington, D. C.; emeritus fellow of the American Academy of Pediatrics; served in various capacities on the staff of the Childrer's Hospital from 1892 until his retirement in 1938, when he was honored by a tablet citing his distinguished services to the institution, and his friends established the Frank Leech Laboratory Fund; formerly on the consulting staff of the Garfield Memorial Hospital; fellow of the American College of Physicians; aged 72; died, February 7, in the Walter Reed General Hospital of cerebral thrombosis.

John Joseph Killeen, Chicago; Jenner Medical College, Chicago, 1904; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; member of the Illinois State Medical Society; formerly assistant clinical professor of ear, nose and throat diseases at the Loyola University School of Medicine; assistant in ear, nose and throat diseases, Rush Medical College, Chicago, from 1907 to 1909; instructor in ear, nose and throat diseases, Chicago Polyclinic from 1909 to 1911; surgeon for the Baltimore and Ohio Railroad from 1909 to 1914; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; served during World War I; consulting ear, nose and throat surgeon, U. S. Marine Hospital; otolaryngologist and attending surgeon, St. Anthony de Padua Hospital and St. Mary of Nazareth Hospital, where he died, March 17, aged 64.

Maynard Ladd, Newton Square, Pa.; Harvard Medical School, Boston, 1898; member of the Massachusetts Medical Society; past president of the American Pediatric Society and the New England Pediatric Society; assistant in physical chemistry from 1900 to 1902, assistant in diseases of children from 1900 to 1903, assistant in pediatrics from 1903 to 1906, instructor in pediatrics from 1906 to 1922 and associate in pediatrics from 1922 to 1938 at his alma mater; was deputy commissioner of the children's bureau of the American Red Cross in France and directed hospitals there during World War I; in 1934 was made an *Officier d'Académie*, France; consulting physician to the Children's Hospital; medical director of the preventive clinic, Boston Dispensary; aged 69; died, March 9, in Media of cardiorenal disease.

Daisy Maude Orleman Robinson * Washington, D. C.; Columbian University Medical Department, Washington, 1890; member of the Medical Society of the State of New York; joined the medical corps of the French army during World War I and later was transferred to the United States Army, with a commission as major; received decorations from both governments; formerly associated with the U. S. Public Health Service; at one time member of the state board of health of New York; aged 72; died, March 13, in St. Luke's Hospital, Jacksonville, Fla.

John Frederick Kuhn * Oklahoma City; Georgetown University School of Medicine, Washington, D. C., 1901; professor emeritus of gynecology at the University of Oklahoma School of Medicine; member of the Central Association of Obstetricians and gynecologists; fellow of the American College of Surgeons; member of the surgical staff of the State University and Crippled Children's Hospital; consulting surgeon, St. Anthony's Hospital; aged 69; died, February 14, in Decatur, Ga., of coronary thrombosis.

Bryan Charles Magennis, Paterson, N. J.; University of the City of New York Medical Department, New York, 1883; formerly a dentist; member of the Medical Society of New Jersey; past president of the Passaic County Medical Society; fellow of the American College of Surgeons; veteran of the Spanish-American War; at one time health officer and member of the city board of health; consulting surgeon, Paterson General and the Nathan and Miriam Barnert Memorial hospitals; aged 83; died, February 17.

Charles Barnett Reynolds, Philadelphia; Medico-Chirurgical College of Philadelphia, 1899; fellow of the American College of Surgeons; served during World War I; formerly associate professor of obstetrics at the Medico-Chirurgical College, Graduate School of Medicine, University of Pennsylvania; on the courtesy staff of the Graduate Hospital; visiting gynecologist of the Germantown, Jewish, Presbyterian and Hahne-

mann hospitals; aged 69; died, March 1, of carcinoma of the rectum.

Henry Wilbur Irwin, Indianapolis; University of California Medical School, San Francisco, 1910; member of the Indiana State Medical Association; served during World War I; formerly a medical missionary in China and instructor at the West China Union University School of Medicine at Chengtu, Szechwan, China; aged 60; on the staffs of St. Francis Hospital, Methodist Hospital, Indiana University Hospital and St. Vincent's Hospital, where he died, February 8, of bronchopneumonia.

Jacob Joshua Levy, Syracuse, N. Y.; Syracuse University College of Medicine, 1903; member of the Medical Society of the State of New York, American Roentgen Ray Society and the Radiological Society of North America, Inc.; associate professor of clinical medicine in physical therapy at his alma mater; on the staff of the University Hospital of the Good Shepherd; aged 62; died, February 22, in Rochester, Minn., of acute myelogenous leukemia.

Hermann Fischer * New York; Columbia University College of Physicians and Surgeons, New York, 1896; an Affiliate Fellow of the American Medical Association; fellow of the American College of Surgeons; member of the American Association for Thoracic Surgery; formerly clinical professor of surgery at the New York University College of Medicine; on the staff of the Lenox Hill Hospital; aged 70; died, March 5, of coronary thrombosis.

Fuad Isa Shatara * Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1916; fellow of the American College of Surgeons; instructor in the department of anatomy at the Long Island College Hospital from 1924 to 1929; visiting surgeon and chief, traumatic service, Cumberland Hospital; member, surgical courtesy staff, Harbor Hospital; surgeon, Prospect Heights Hospital; aged 48; died, January 8.

Dorsey Mahon McPherson * Washington, D. C.; Howard University College of Medicine, Washington, 1877; Columbian University Medical Department, Washington, 1884; joined the medical corps of the Army and served two years in the field with the Indian Scouts and the Sixth Cavalry; served as medical examiner of pensions and later as medical expert in the office of the Secretary of the Interior; aged 84; died, March 2.

Harold Carl Goodwin, Springfield, Mass.; Dartmouth Medical School, Hanover, N. H., 1900; member of the Massachusetts Medical Society; division examiner of prisoners for the commonwealth of Massachusetts; at one time superintendent of the Albany (N. Y.) Hospital; on the staffs of the Mary Lane Hospital, Ware, and of the Mercy and Wesson Memorial hospitals; aged 63; died, March 1, of coronary thrombosis.

Charles Wilson Doughtie * Norfolk, Va.; Medical College of Virginia, Richmond, 1898; fellow of the American College of Surgeons; past president of the Norfolk County Medical Society; served on the staff of the Norfolk General Hospital in various capacities; for many years surgeon to the Norfolk and Western Railway; member of a draft board during World War I; aged 65; died, March 5, of pulmonary embolism.

Lionel David Prince * San Francisco; University of California Medical Department, San Francisco, 1912; member of the American Academy of Orthopedic Surgeons; fellow of the American College of Surgeons; past president of the Western Orthopedic Association; served during World War I; chief orthopedic surgeon, Mount Zion Hospital; aged 55; died, March 6, in the University of California Hospital.

Archibald Addison Alexander, Oakland, Calif.; University of California Medical Department, San Francisco, 1907; member of the California Medical Association; fellow of the American College of Physicians; chief in cardiology, Samuel Merritt Hospital; associate in medicine, Alameda County Hospital; consultant in cardiology, Children's Hospital of the East Bay; aged 61; died, January 17.

James Brodie Ross, Montreal, Que., Canada; McGill University Faculty of Medicine, Montreal, 1924; assistant professor of medicine at his alma mater; member of the American Clinical and Climatological Association; secretary of the medical board of the Montreal General Hospital; formerly medical superintendent of the Children's Memorial Hospital; aged 41; died, March 7.

Dennis David Daly, Ellenburg Depot, N. Y.; Syracuse University College of Medicine, 1901; member of the Medical Society of the State of New York; had been health officer for many years of several Clinton County communities at intervals

since 1904; formerly member of the board of education; aged 66; died, February 5, of ventricular fibrillation, coronary occlusion and sclerosis.

Carolyn N. Macdonald @ Chicago; Rush Medical College, Chicago, 1925; formerly clinical assistant in urology at the Northwestern University Medical School; past president and vice president of the Chicago Council of Medical Women; on the staff of the Women and Children's Hospital; aged 54; died, February 20, in St. Luke's Hospital of chronic nephritis and uremia.

Dana W. Kingsbury @ Nanticoke, Pa.; College of Physicians and Surgeons, Baltimore, 1882; an Affiliate Fellow of the American Medical Association; was a member of the draft board during World War I; member of the board of education; for many years surgeon for the Pennsylvania Railroad Company; aged 89; died, February 8, of arteriosclerotic heart disease.

William De Lue Anderson, Portland, Maine; Medical School of Maine, Portland, 1915; also a pharmacist; fellow of the American College of Surgeons; member of the Maine Medical Association; formerly county medical examiner; associate surgeon, Maine General Hospital; surgeon, Maine Eye and Ear Infirmary; aged 61; died, March 1, of coronary thrombosis.

Adolph Von Prief Fardelmann @ Brooklyn; Long Island College Hospital, Brooklyn, 1916; fellow of the American College of Surgeons; president of the Brooklyn Surgical Society; surgeon during World War I; aged 48; courtesy surgeon, St. John's Hospital; on the staffs of the Lutheran Hospital and the Bushwick Hospital, where he died, February 17.

Rowland William Hall @ Jackson, Miss.; University of Nashville (Tenn.) Medical Department, 1901; past president of the Central Medical Society; member of the American Academy of Dermatology and Syphilology; at one time registrar of vital statistics, state board of health; aged 66; died, February 14, at his home in Clinton.

Dora Van Buren Burkett, Columbus, Ohio; Ohio Medical University, Columbus, 1902; member of the Ohio State Medical Association; veteran of the Spanish-American War and World War I; formerly a lieutenant colonel and chief surgeon of the Ohio National Guard; aged 69; died, March 2, of coronary sclerosis and arteriosclerosis.

David Henry Lawrence, Big Spring, Texas; University of Texas School of Medicine, Galveston, 1902; member of the State Medical Association of Texas; served during World War I; formerly associated with the U. S. Veterans Bureau; on the staff of the Big Spring State Hospital; aged 66; died, February 5, of coronary disease.

David Stewart Fettes, Brooklyn; Long Island College Hospital, Brooklyn, 1907; member of the Medical Society of the State of New York; served during World War I; assistant visiting surgeon on the staff of the Cumberland Hospital; secretary of the medical board of the Madison Park Hospital; aged 61; died, February 16.

Henry Bacon, Jacksonville, Fla.; Bellevue Hospital Medical College, New York, 1883; member of the Florida Medical Association; was retired with rank of brigadier general after nearly twenty-five years of service in the Florida National Guard; for many years on the staff of St. Luke's Hospital; aged 84; died, February 8.

Robert Black Hopkins @ Milton, Del.; Jefferson Medical College of Philadelphia, 1887; past president of the Medical Society of Delaware; member of the board of education of Milton and past president of the county board of education; formerly mayor; at one time member of the state legislature; aged 76; died, March 8.

Jack Halton, Sarasota, Fla.; Miami Medical College, Cincinnati, 1895; member and formerly vice president of the Florida Medical Association; past president of the Florida Railway Surgeons Association; served during World War I; aged 73; died, February 26, in St. Petersburg of coronary thrombosis.

George Joseph Tusson, New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1901; assistant demonstrator in the microscopic laboratory at his alma mater, 1907-1908; veteran of the Spanish-American War; on the staff of the French Hospital; aged 74; died, January 17.

Joseph Wright McCreedy @ Newburgh, N. Y.; Bellevue Hospital Medical College, New York, 1888; an Affiliate Fellow of the American Medical Association; member of the Medical Society of the State of New York; aged 78; died, Dec. 31, 1941, of cerebral hemorrhage, hypertension and arteriosclerosis.

Albert Frederick Ullman, New York; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany,

1914; member of the Medical Society of the State of New York; on the staff of the Hospital for Joint Diseases; aged 52; died, January 20, in Bellevue Hospital.

Franz Pfister, Milwaukee; University of Wooster Medical Department, Cleveland, 1895; past president of the Milwaukee County Medical Society; formerly professor of ear, nose and throat at the Marquette University School of Medicine; aged 81; died, March 2, of pneumonia.

C. Curtis Hudson @ Greensboro, N. C.; University College of Medicine, Richmond, Va., 1910; served during World War I; health officer; formerly health officer of Danville, Va., Charlotte, N. C., and Richmond, Va.; aged 60; died, February 17, of coronary occlusion.

Frederick Prescott Batchelder, Boston; Boston University School of Medicine, 1891; professor emeritus of physiology at his alma mater; consultant on the staff of the Massachusetts Memorial Hospitals; aged 77; died, February 14, of carcinoma of the left kidney.

James Thomas Ferrell, Chapmanville, W. Va.; West Virginia College of Medicine and Surgery, 1913; member of the West Virginia State Medical Association; aged 56; died, February 9, in a hospital at Huntington of anaphylactic shock and hypertrophy of the prostate.

Arthur M. Bishop, Good Hope, Ill.; Northwestern University Medical School, Chicago, 1898; member of the Illinois State Medical Society; aged 70; died, January 11, in St. Luke's Hospital, St. Louis, of injuries received in an automobile accident on Dec. 30, 1941.

Franklin Herbert Hagerman, Milwaukee; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1892; member of the State Medical Society of Wisconsin; aged 80; died, February 1, in the Milwaukee Hospital of carcinoma of the bladder.

Andrew Peters @ Springfield, Mass.; Columbia University College of Physicians and Surgeons, New York, 1914; member of the American College of Chest Physicians; chief, tuberculosis service, Health Department Hospital; aged 51; died, January 8.

George Van Wyland @ Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1898; on the staff of St. Anne's Hospital; aged 71; died, March 23, of injuries received in an automobile accident.

George Irvine I. Ireland, Tyler, Pa.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1923; member of the Medical Society of the State of Pennsylvania; aged 41; died, February 8, in Mill Run of malignant hypertension.

Joseph E. Hawley, Burr Oak, Kan.; St. Joseph (Mo.) Hospital Medical College, 1882; member of the Kansas Medical Society; past president of the Jewell County Medical Society; aged 89; died, February 11, of hypostatic pneumonia.

Peter Joseph Fleming, Boston; University of Western Ontario Medical School, London, Ont., Canada, 1902; member of the Massachusetts Medical Society; aged 66; died, Dec. 15, 1941 of chronic lymphatic leukemia and bronchopneumonia.

Thomas Buffington Bird, Baton Rouge, La.; Tulane University of Louisiana School of Medicine, New Orleans, 1914; member of the Louisiana State Medical Society; served during World War I; aged 54; died, February 6, of carcinoma.

Perry Arnold Kendall @ Crothersville, Ind.; University of Louisville (Ky.) Medical Department, 1893; aged 72; died, February 1, in St. Joseph's Infirmary, Louisville, Ky., of diabetes mellitus, arteriosclerosis and ulcer of the stomach.

Scott M. Huff, Belleville, N. J.; Jefferson Medical College of Philadelphia, 1893; served during World War I; formerly on the staff of the Veterans Administration Facility, Lyons; aged 73; died, February 25, of cerebral hemorrhage.

Charles Howard Dalton @ Somerville, Mass.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1901; on the staff of the Somerville Hospital; aged 65; died, February 12, of coronary thrombosis.

Joseph Casimer Ciesla, Chicago; University of Illinois College of Medicine, Chicago, 1927; member of the Illinois State Medical Society; aged 39; died, February 14, in Mexico of pulmonary tuberculosis.

John Richard Bozarth, Miami, Fla.; Rush Medical College, Chicago, 1891; aged 71; died, February 3, in the Jackson Memorial Hospital of bronchogenic carcinoma of the right lung and pleurisy with effusion.

Frank Joseph Kosek, Wilkes-Barre, Pa.; University of the South Medical Department, Swannee, Tenn., 1904; formerly city bacteriologist; aged 61; died, February 10, of carcinoma of the prostate.

James Charles Pecl * Cleveland; Ohio State University College of Medicine, Columbus, 1922; served during World War I; aged 47; died, January 9, at his home in Brecksville, Ohio, of coronary occlusion.

William P. Knight * Greensboro, N. C.; Baltimore Medical College, 1898; past president of the Guilford County Medical Society; aged 69; died, February 2, in St. Leo's Hospital of carcinoma of the lung.

Samuel James Herman, Detroit; Maryland Medical College, Baltimore, 1900; Baltimore Medical College, 1901; aged 68; died, February 20, in Los Angeles of multiple septic cerebral emboli and lung abscess.

Leon Grotowski * Chicago; Chicago College of Medicine and Surgery, 1913; served during World War I; on the staff of St. Mary of Nazareth Hospital; aged 63; died, February 4, of coronary occlusion.

Joseph Maurice Becker, Washington, D. C.; Georgetown University School of Medicine, Washington, 1934; member of the Medical and Chirurgical Faculty of Maryland; aged 33; died, January 14.

Alois Friedrich Haas, Rutland, Mass.; Medizinische Fakultät der Universität Wien, Austria, 1937; aged 28; died, February 14, in the State Sanatorium of tuberculosis of the lungs and larynx.

Anthony Augustus O'Neill, Chicago; Kansas City (Mo.) Medical College, 1890; member of the Illinois State Medical Society; fellow of the American College of Surgeons; aged 82; died, January 4.

James Luther Adams * Hobart, Okla.; College of Physicians and Surgeons, Little Rock, Ark., 1910; county health superintendent; aged 62; died, Dec. 31, 1941, of coronary thrombosis.

Frederick William Heath * Oakdale, La.; Tulane University of Louisiana School of Medicine, New Orleans, 1933; aged 37; died, January 27, in a hospital at Alexandria of pneumonia.

Okey N. Windle, Sayre, Okla.; Maryland Medical College, Baltimore, 1905; member of the Oklahoma State Medical Association; aged 58; died, January 3, of coronary occlusion.

Isaac H. Lane, La Grange, Ga.; Atlanta Medical College, 1891; member of the Medical Association of Georgia; aged 75; died, February 25, of nephritis and coronary thrombosis.

James Christian Chestnut * Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1897; on the staff of the Stetson Hospital; aged 66; died, January 28.

William Henry Hicks, Newark, N. J.; University of the City of New York Medical Department, 1893; aged 77; died, February 13, of chronic myocarditis and chronic prostatitis.

Claude Alvah Horton, Glens Falls, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1892; aged 75; died, February 14, of myocarditis.

Austin Taylor Bryant, McKinney, Texas; Memphis (Tenn.) Hospital Medical College, 1894; aged 81; died, February 11, of coronary thrombosis.

John E. Lawson, Jeffersonville, Ind.; University of Louisville (Ky.) Medical Department, 1874; aged 87; died, February 15, of arteriosclerosis and uremia.

William Elmo Arthur * Cardiff, Md.; University of Maryland School of Medicine, Baltimore, 1892; bank president; aged 73; died, January 2.

Charles W. Boush, Beavertown, Pa.; Baltimore University School of Medicine, 1893; aged 73; died, January 26, of chronic myocarditis and arteriosclerosis.

William Robert Gaddie * Duenweg, Mo.; Hospital College of Medicine, Louisville, Ky., 1898; aged 71; died, January 11, of coronary occlusion.

Chester Harlow Gould, Pasadena, Calif.; Boston University School of Medicine, 1896; aged 70; died, February 8, in a local hospital of pneumonia.

Isaac Bright Hines, Fresno, Calif.; Boston University School of Medicine, 1890; aged 85; died, February 18, in St. Agnes Hospital of pneumonia.

Henry Francis Sears, Boston; Harvard Medical School, Boston, 1887; member of the Massachusetts Medical Society; aged 79; died, January 1.

Theodore Ferdinand Segelcke, Brooklyn; Long Island College Hospital, Brooklyn, 1898; aged 65; died, January 13, of coronary thrombosis.

Andrew Charles Topie, Cincinnati; Medical College of Ohio, Cincinnati, 1899; aged 73; died, January 6, of diabetes mellitus and pneumonia.

Campbell McGavern Chapman, Des Moines, Iowa; Rush Medical College, Chicago, 1894; aged 73, died February 13, in Miami, Fla., of heart disease.

Walter Irving Stockton, Siler City, N. C.; College of Physicians and Surgeons, Baltimore, 1914; aged 51; died, January 16, in Pittsboro.

Arthur W. Wilson, Chicago; Bennett Medical College, Chicago, 1903; aged 74; died, January 22, in Los Angeles of cerebral hemorrhage.

Joseph Watry, Evanston, Ill.; Hahnemann Medical College and Hospital, Chicago, 1883; aged 78; died, January 22, of coronary sclerosis.

G. P. Fisher, Ethel, W. Va.; Kentucky School of Medicine, Louisville, 1908; aged 68; died, February 9, in Pocataligo of diabetes mellitus.

William T. Henry, Stevensville, Md.; College of Physicians and Surgeons, Baltimore, 1896; aged 72; died, January 25, of hemiplegia.

Ottul Klaranus Lindboe, Lac Qui Parle, Minn.; Rush Medical College, Chicago, 1887; aged 90; died, February 5, of myocarditis.

James Thomas Dean, Moorhead, Miss.; Louisville (Ky.) Medical College, 1891; aged 82; died, February 3, of chronic myocarditis.

Howard Riely Moore, Charles Town, W. Va.; College of Physicians and Surgeons, Baltimore, 1883; aged 80; died, January 10.

Perry Dickie, New York; New York Homeopathic Medical College, 1880; aged 85; died, January 20, of bronchopneumonia.

Charles Mead Griffin, West Tisbury, Mass.; Bellevue Hospital Medical College, New York, 1881; aged 84; died, Dec. 15, 1941.

William Carter, Chicago; National Medical University, Chicago, 1904; aged 71; died, January 4, in the Provident Hospital.

William Keer Fouts, Dallas, Texas; University of Louisville (Ky.) Medical Department, 1888; aged 73; died, January 15.

Martin V. Newman, Fouke, Ark. (licensed in Arkansas in 1903); aged 66; died, January 8, of carcinoma of the gall-bladder.

Joseph Maybank, Charleston, S. C.; University of Maryland School of Medicine, Baltimore, 1889; aged 72; died, January 2.

Solomon F. Oden, Brentwood, Tenn.; University of Nashville (Tenn.) Medical Department, 1872; aged 93; died January 6.

George Kennedy Frink, San Francisco; Medical College of the Pacific, San Francisco, 1887; aged 81; died, January 23.

William Augustus Griffith, Covina, Calif.; Long Island College Hospital, Brooklyn, 1889; aged 83; died, January 20.

Justus O. Enzor, Baker, Fla.; Medical College of Alabama, Mobile, 1901; aged 64; was found shot and killed, February 23.

Harper Ancel Wright, Duncansville, Pa.; Baltimore University School of Medicine, 1904; aged 60; died, January 6.

DIED IN MILITARY SERVICE

Ira Brown * Chicago; University of Oklahoma School of Medicine, Oklahoma City, 1932; was appointed a first lieutenant in the medical reserve corps of the U. S. Army, Oct. 16, 1935; became a captain April 11, 1940 and a major Feb. 1, 1942; fellow of the American College of Surgeons; formerly clinical instructor of gynecology and obstetrics at the University of Chicago, The School of Medicine; at one time associate in obstetrics and gynecology at the Chicago Lying-in Hospital and Dispensary; aged 35; was burned to death, April 10, when a fire destroyed an officers' barracks at Camp Grant, Ill.

Harry Sage Gorelick, Detroit; University of Michigan Medical School, Ann Arbor, 1930; member of the Michigan State Medical Society; commissioned a first lieutenant in the medical reserve corps of the U. S. Army March 29, 1934 and promoted to captain, July 5, 1941; formerly on the staff of the City of Detroit Receiving Hospital; aged 35; was burned to death, April 10, when a fire destroyed an officers' barracks at Camp Grant, Ill.

Bureau of Investigation

THEODORE MARGOLIN—A MODERN PROTEUS

He Promoted One Fraud One Day, Another the Next

A man of rare gifts is Theodore Margolin of Brooklyn. In his pursuit of profitable schemes to foist on a trusting public, not even the Post Office fraud orders that have been issued to debar his schemes from the mails have seemed to discourage him; he has gone merrily on his way developing new swindles to separate the credulous from their money. Apparently without training in medicine or chemistry, Margolin blossomed out as an alleged expert in bust development. Under his own name and a fancier trade style, "Developex Company," he advertised and sold through the mails what he called "Developex" for increasing the size of the bust and building up "thin or unshapely" legs to attractive proportions. For either condition his treatment constituted "a new and easy method."

It mattered not to Mr. Margolin that other "bust developers" had at various times run afoul of the postal laws and been banned from the mails by Post Office fraud orders. But the day came when the government caught up with him. After due investigation of his scheme the Post Office on June 12, 1941 ordered him to show cause why a fraud order should not be issued and the mails closed to his scheme. Even after Margolin had obtained several postponements he did not appear at the hearing when it finally occurred on August 8, nor did any one else appear there to represent him.

Nothing more wonderful than lanolin (hydrous wool fat), cocoa butter and a little water and perfume was found to make up Developex, according to the testimony of a government chemist who had analyzed it. Such a mixture contributed nothing new to medical science, as shown by an expert medical witness for the government, since hydrous wool fat and cocoa butter have for years been familiar substances to the medical profession and used chiefly as bases for ointments. This witness further testified that flat, undeveloped or sagging breasts are due to various causes, such as underweight, undernourishment, hypothyroidism, tuberculosis, anemia and failure of the endocrine glands to develop. Further, sagging breasts may result from prolonged nursing after pregnancy. He proceeded to show that a mixture like Developex could not affect the glandular system which controls the bust development or tighten or shorten the fibrous supporting bands of breasts which have been stretched by overlactation. Hence, he testified, the product is worthless for effecting any change in the size or contour of the breasts.

"Thin or unshapely" legs, this witness further testified, may be due to any one of many causes such as underweight, undernourishment, debilitating, chronic diseases, hereditary influences, glandular disorders, mineral and vitamin deficiency, bony deformities, bowlegs, knock-knees, misshapen feet and other factors. Developex of itself, he pointed out, would have no effect on the size or shape of the legs or on any disorder which might cause the legs to be thin or unshapely because it would not build up the tissues or affect the fat deposits in the body, since any absorption which it might bring about through the skin would be inconsequential.

As a result of the foregoing evidence, the Post Office on Nov. 27, 1941 issued a fraud order against the Developex Company of Brooklyn, Theodore Margolin and their officers and agents. On the same date a similar order was brought against the Legalure Company of Brooklyn and its officers and agents. The Legalure name was the trade style under which Margolin had promoted "Legalure Method," another nostrum that was supposed to make unsightly legs attractive. Its advertising blurbs were similar to those of Developex. When this case, after several postponements, finally reached a hearing on Aug. 8, 1941 neither Margolin nor any one representing him appeared to offer a defense, though a written answer denying

the charges of fraud had been submitted. A government chemist who had analyzed the cream which constituted the "treatment" testified that it consisted of a white, oily ointment of which 1.1 per cent was camphor, 8.37 per cent water and the rest fats, oils and wax, with a trace of perfume. Hence it seems to have been similar to, if not entirely identical with, Margolin's other "leg beautifier," Developex.

An expert medical witness for the government gave testimony regarding this second "leg developer" and showed it to be equally worthless. He stated further that the use of the Legalure Method might even prove dangerous to the user in instances in which diseases causing unattractive legs might call for exercises, and these the customer might neglect in favor of Legalure. Altogether the treatment was shown to be as worthless as Developex, and hence the companion fraud order against it.

But Margolin had by no means run out of anatomy for correction. Though forbidden longer to pretend to beautify America's busts and legs, he could at least claim to reduce the obese and adorn the bald—until the Post Office again might catch up with him. Soon he was angling for the two most gullible types of suckers—the fat woman who yearns for svelt lines and the bald-headed man who hopes for a hair restorer.

As an illustration of his total disregard for Post Office fraud orders, ". . . Margolin, having been advised that a fraud order was issued against Thinalax Co., at Jersey City, New Jersey, on February 10, 1941, and that another fraud order was issued against Grohair Company, at Jersey City, New Jersey, on February 15, 1941, both of which concerns were at that time owned by one Harry Hitter, purchased from said Hitter the stock in trade of said concerns, including the products known as 'Thinalax' and 'Grohair,' the mailing lists of said concerns, and the names and addresses of all persons who had been provided with the advertising literature of said concerns. . . ."

Hitter's nostrum "Thinalax" was reported by a government chemist to consist of pink coated pills whose essential constituents were extracts of belladonna and cascara sagrada with aloin, podophyllum and oleoresin of ginger. Although the advertising gave the impression that the user of these pills would not have to follow a diet, the treatment was accompanied by a "Slenderizing Menu for the Week" which prescribed what the Post Office called "an extremely limited dietary, both as to quantity and character of food permitted." A physician who testified for the government at the hearing of this case declared that the diet list in question amounted to a starvation regimen. He further testified that among other things the use of these pills would tend to produce a laxative habit—one of the conditions that the promotor warned against in the directions that came with the pills! Less than ten months later, on Dec. 3, 1941, a Post Office fraud order was issued which barred Margolin's Thinalax Company from the mails.

Hitter's nostrum "Grohair" was promoted with representations that it would grow a full head of hair on any one who used it, "no matter what condition" the user's hair was in or even if he was completely bald. According to the government chemist who analyzed it, the stuff was a hydroalcoholic liquid containing about 14 per cent of kerosene, 15 per cent of castor oil and 0.11 per cent of betanaphthol with about 60 per cent of alcohol, the remainder being water. Grohair was the second of Hitter's swindles to be scotched by a Post Office fraud order, which was issued on Feb. 15, 1941. Some time thereafter, it is reported, the business was taken over by Margolin, who purchased from Hitter all of the stock in trade, mailing lists and names of customers, just as he had done with Hitter's Thinalax Company. But, as in his experience with the latter business, a fraud order put an end to his Grohair enterprise. on Dec. 3, 1941.

From the record, do not be surprised to find Margolin blossoming out some time with a "cure" for projecting ears or flapping ears. And then of course the Post Office Department will investigate and there will be another fraud order, and so on and on and on through the years.

Correspondence

VITAMIN K FOR THE NEWBORN

To the Editor:—Is administration of vitamin K to the newborn of clinical value? This question has been answered guardedly by Sanford and associates in *THE JOURNAL* of February 28 but confidently by Quick in a communication to *THE JOURNAL* of March 21. The difference of opinion represents the chasm between a clinical and a chemical evaluation of the problem. Not all hemorrhagic manifestations in the newborn are due to acute hypoprothrombinemia, and not all cases of "hemorrhagic disease of the newborn" are due to diminution in blood prothrombin.

The clotting mechanism may be defective in platelets, leading to thrombocytopenic purpura; in platelet function, leading to thrombopathy; in fibrinogen, leading to fibrinogenopenia; in vascular resistance, leading to allergic, infectious or toxic purpura. The clotting mechanism may be normal, and yet bleeding may occur from vascular injury incident to the birth process. In the past, hemorrhagic disease of the newborn was a syndrome attributed to any defect in the clotting mechanism excluding vascular injury. Today, hemorrhagic disease of the newborn is a disease entity due specifically to prothrombin deficiency. This concept was formulated by me from 9 case reports published in *THE JOURNAL* Sept. 10, 1932, page 895.

Acute hypoprothrombinemia in the newborn is the only condition that responds promptly to vitamin K therapy. Since the disease occurs in less than 0.5 per cent of all newborn infants it is folly to waste vitamin K on 99.5 per cent of the remainder, even if many of these may show hemorrhagic manifestations! If the latent hemorrhagic tendency present in all newborn infants becomes active, the rise in clotting time will indicate decrease in available prothrombin. Then and only then is vitamin K therapy indicated.

I. NEWTON KUGELMASS, M.D., New York.

To the Editor:—Dr. Sanford and his associates in an article entitled "Is Administration of Vitamin K to the Newborn of Clinical Value?" (*THE JOURNAL*, February 28, p. 697) seriously question the value of vitamin K in the prophylaxis and treatment of hypoprothrombinemia and associated hemorrhage of the newborn. I am forced to join with Dr. Quick in taking prompt and sharp exception to Dr. Sanford's conclusions.

Early in 1939 in a brief preliminary article my associates and I called attention to the prompt and efficient action of vitamin K in the prevention and treatment of hypoprothrombinemia and hemorrhage in the newborn and have repeatedly stated that hemorrhagic disease would not occur in any infant adequately protected with vitamin K. We have also repeatedly expressed the hope, adequately supported by facts, that infant mortality resulting from intracranial hemorrhage will in the future possibly be materially reduced by this sound therapeutic procedure. Just how well these therapeutic suggestions have proved to be accomplished facts is well attested by the rapidly accumulating literature on this subject. With the single exception of Dr. Sanford there would seem to be complete agreement among all investigators of this subject. As Dr. Quick points out, the efficiency of vitamin K in the prevention and treatment of hemorrhagic disease of the newborn is "unequivocally and emphatically" proved. Having recorded more than two thousand prothrombin time determinations and treated an equal number of infants with vitamin K, I cannot agree with Dr. Sanford in his conclusions. I have yet to see recorded a single case of hemorrhagic disease with associated prothrombin deficiency occurring in any infant adequately protected with vitamin K, and it should be emphasized that treated infants now can be numbered in the thousands.

Dr. Sanford's series of only 42 infants treated with vitamin K through the mothers certainly does not justify any discussion concerning the possible reduction in the mortality rate of intracranial hemorrhage. Certainly his figures can hardly be compared with those of Hellman and Shettles (*South. M. J.* 35:289 [March] 1942). Their mortality of 1.9 per cent among 1,042 infants treated through the mother compared to a mortality of 3.9 per cent among 1,206 untreated infants, with the odds against this being an accident 194.7 to 1, is most convincing. Beck, working in three different hospitals, was able to reduce his infant mortality rate by 3:1. Such convincing reports can hardly be accidental.

Dr. Sanford's experience with the rates of hemorrhage in treated and control groups of infants differs considerably from our own observations and those of Beck (*Am. J. Obst. & Gynec.* 41:765 [May] 1941):

	Controls, Cases	Incidence of Hemorrhage, per Cent	Treated, Cases	Incidence of Hemorrhage, per Cent
Sanford.....	982	6.6	711	6.59
Beck.....	1,037	2.0	1,022	0.5
Waddell.....	219	10.4	1,118	1.07

There seems no good reason why Sanford should be able to show any reduction in the rate of cerebral accidents, since in his series the infant was not treated through the mother. Beck's series tells a different story, with 14 instances of intracranial hemorrhage in a group of 1,037 controls as contrasted with 4 instances of intracranial hemorrhage among 1,022 treated infants.

I had the privilege of assisting in a round table discussion of hemorrhage in the newborn at the recent meeting of the American Academy of Pediatrics. Associated with me in these discussions were Drs. Clifford, Poncher and Snelling, all of whom have had intimate experience with the therapeutic efficiency of vitamin K. All four members of this round table discussion were in complete agreement concerning the role of vitamin K in the prevention and treatment of hypoprothrombinemia and hemorrhage in the newborn. These discussions will shortly be published.

I hope, Mr. Editor, in fairness to infants yet to be born and liable to the potential danger of latent hypoprothrombinemia, that you will give this communication early publication. I trust that those members of the medical profession not conversant with the current literature on this subject will not be encouraged to deny to newborn infants a proved and efficient therapeutic agent.

W. W. WADDELL JR., M.D., University, Va.

PHONOGRAPHIC RECORDING OF HEART SOUNDS

To the Editor:—There has been some correspondence in *THE JOURNAL* in recent weeks about phonographic recording of heart sounds.

For historical interest, I would add that Dr. Richard Cabot made such recordings from Oct. 31, 1925 to Jan. 6, 1926 in New York City with the Columbia Phonograph Company, now the Columbia Recording Corporation. I have some of his old records, which are interesting rather because of their excellent reproduction of Dr. Cabot's voice than for their value in phonocardiography, a characteristic still true of many other such records, though improvements are in progress in the effort to develop this procedure into a practical method of teaching and of recording.

PAUL D. WHITE, M.D., Boston.

Council on Medical Education and Hospitals

CONTINUATION COURSES FOR PRACTICING PHYSICIANS

In accordance with the plan of the Council on Medical Education and Hospitals, advance information concerning continuation courses for practicing physicians available in the various centers is published quarterly. The following list consists of courses

beginning during the period April 20-July 20, 1942. It is hoped that this material will be useful to the practicing physician who is planning to take postgraduate work but does not have a ready means of knowing when and where the subjects in which he is interested will be taught. Since many of the classes are necessarily limited, those who contemplate enrolling in any of these courses are urged to communicate as early as possible with the proper executive officer.

H. G. WEISKOTTEN, M.D.,
Secretary, Council on Medical
Education and Hospitals.

Continuation Courses for Practicing Physicians, April 20-July 20, 1942

Institution	Courses Begin	Length and Content of Course	Number of Students Accepted	Registration Fee and/or Tuition	For Detailed Information Write to
ALLERGY					
Harvard Medical School, Courses for Graduates	July 6	Full time, 2 weeks; diagnosis and treatment, prep. of vaccines	6 ¹	\$50	Dr. Frank R. Ober, Asst. Deao, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
New York University College of Medicine	May 15	MWF afternoons; lab. technique	Limited ²	\$150	Dr. Currier McEwen, Dean, New York University College of Medicine, 477 First Avenue, New York City
	July 16	MWF afternoons; hypersensitivity 6 mo.			
Tufts Medical School, Post-Graduate Division	May 18	1 week; lectures, clinic demonstrations	Minimum: 6	\$25 ³	Dr. Samuel Proger, Chairman, Post-Graduate Division, Tufts Medical School, Boston, Mass.
University of Michigan, Department of Post-Graduate Medicine	May 11	5 days	\$10-\$25	Dr. James D. Bruce, Chairman, Department of Post-Graduate Medicine, University of Michigan, 1313 E. Ann Street, Ann Arbor, Mich.
University of Pennsylvania, Graduate School of Medicine	Arranged on application	4 weeks, about 40 hours	Individual ⁴	\$150	Dr. R. C. Buerki, Dean, Graduate School of Medicine, The Medico-Chirurgical College, 237 Medical Laboratories, Philadelphia, Pennsylvania
ANATOMY—See also Gynecology, Otolaryngology, Psychiatry and Neurology, and Surgery					
Harvard Medical School, Courses for Graduates	July 6	Full time, 6 weeks; microscopic anatomy	\$60 ⁵	Dr. Frank R. Ober, Asst. Dean, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
New York Medical College, Flower and Fifth Avenue Hospitals	Arranged on application	60 hours; applied anatomy of the urogenital system	\$150 ⁶	Dr. J. A. W. Hettrick, Acting Dean, New York Medical College, Flower and Fifth Avenue Hospitals, 5th Ave. at 16th St., New York City
	Arranged on application	60 hours; applied anatomy of ear, nose and throat	\$150 ⁶	
	Arranged on application	90 hours; applied anatomy of pelvis and abdomen	\$250	
	Arranged on application	100 hours; surgical anatomy ⁷	\$250	
ANESTHESIOLOGY					
Columbia University, including the New York Post-Graduate Medical School	Arranged on application	12 sessions	24 ⁴	\$75 ⁵	The Director, Columbia University School of Medicine, 309 East 20th Street, New York City
	When a vacancy occurs	2 weeks, or 3 weeks if desired	1 ⁴	\$100-\$150	
Harvard Medical School, Courses for Graduates	Monthly	Arranged on application	3	\$90	Dr. Frank R. Ober, Asst. Dean, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
New York Polyclinic Medical School	1st of any month between Oct. 1 and June 30	Arranged on application	Arranged	Dr. F. H. Dillingham, Executive Officer, New York Polyclinic Medical School, 325 West 50th Street, New York City
New York University College of Medicine	April 20	Full time, 3 weeks; inhalation anesthesia	5	\$150	Dr. Currier McEwen, Dean, New York University College of Medicine, 477 First Avenue, New York City
University of Georgia School of Medicine	Arranged on application	Several weeks; training for government service	Limited	None	Dean, University of Georgia School of Medicine, University Place, Augusta, Georgia
BACTERIOLOGY—See also Gastroenterology; Medicine					
Columbia University, including the New York Post-Graduate Medical School	May	Full time, 1 month; practical technique of medical bacteriology	2 ²	\$100	The Director, Columbia University School of Medicine, 309 East 20th Street, New York City
Harvard School of Public Health	May	MWF afternoons, 1 month; applied immunology	Limited ²	\$65 ³	Dr. C. K. Drinker, Dean, Harvard School of Public Health, 55 Shattuck Street, Boston, Massachusetts
	Arranged on application	Arranged; immunology and the technique of serum study	Limited ²	\$65 ³	
	Arranged on application	Arranged; research in communicable diseases	Limited ²	\$65 ³	
New York Polyclinic Medical School	1st of any month between Oct. 1 and June 30	Arranged	Limited ²	Arranged	Dr. F. H. Dillingham, Executive Officer, New York Polyclinic Medical School, 325 West 50th Street, New York City
BIOLOGICAL CHEMISTRY					
Harvard Medical School, Courses for Graduates	Arranged on application	Arranged; research	Arranged ^{2,3}	Dr. Frank R. Ober, Asst. Dean, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
Harvard School of Public Health	Arranged on application	Arranged; nutrition	Limited ²	\$65 ³	Dr. C. K. Drinker, Dean, Harvard School of Public Health, 55 Shattuck Street, Boston, Massachusetts
BRONCHO-ESOPHAGOSCOPY—See also Surgery					
Columbia University, including the New York Post-Graduate Medical School	Arranged on application, Oct.-Apr.	3 weeks; instruments and technique of bronchoscopy	Limited ⁴	\$250	The Director, Columbia University School of Medicine, 309 East 20th Street, New York City

Continuation Courses for Practicing Physicians, April 20-July 20, 1942—Continued

Institution	Courses Begin	Length and Content of Course	Number of Students Accepted	Registration Fee and/or Tuition	For Detailed Information Write to
BRONCHO-ESOPHAGOSCOPY—See also					
Harvard Medical School, Courses for Graduates	Surgery—Continued Arranged on application	2 weeks	Limited ⁴	\$150	Dr. Frank R. Ober, Asst. Dean, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
New York Eye and Ear Infirmary, School of Ophthalmology and Otology	Arranged on application	2 or 6 weeks; broneho-esophagology	4 ²	\$150 ²⁰	Mabel R. Stewart, Registrar, School of Ophthalmology and Otology, New York Eye and Ear Infirmary, 218 Second Ave., New York City
CANCER					
Tufts Medical School, Post-Graduate Division	Arranged on application	Arranged	Minimum: ⁴	Arranged	Dr. Samuel Proger, Chairman, Post-Graduate Division, Tufts Medical School, 30 Bennet Street, Boston, Massachusetts
CARDIOLOGY—See also Internal Medicine					
Columbia University, including the New York Post-Graduate Medical School	June 15	Full time, 3 weeks; cardiovascular diseases	4-15 ²	\$75 ⁵	The Director, Columbia University School of Medicine, 309 East 20th Street, New York City
Harvard Medical School, Courses for Graduates	July 1	Full time, 1 month; modern diagnosis and treatment of heart disease	20	\$150	Dr. Frank R. Ober, Asst. Dean, Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts
New York Medical College, Flower and Fifth Avenue Hospitals	Arranged on application	16 biweekly sessions; clinical cardiology and electrocardiography	\$100	Dr. J. A. W. Hetrick, Acting Dean, New York Medical College, Flower and 5th Avenue Hospitals, Fifth Ave. at 105th St., New York City
Tufts Medical School, Post-Graduate Division	May 11	Full time, 1 week	\$25 ³	Dr. Samuel Proger, Chairman, Tufts Medical School Post-Graduate Division, 30 Bennet Street, Boston, Mass.
University of Michigan, Department of Post-Graduate Medicine	May 14	Full time, 3 days; diseases of the heart	\$10 ²⁵	Dr. James D. Bruce, Chairman, Department of Post-Graduate Medicine, University of Michigan, 1313 East Ann St., Ann Arbor, Mich.
CYSTOSCOPY—See Gynecology, Surgery, Urology					
DERMATOLOGY AND SYPHILOLOGY					
Columbia University, including the New York Post Graduate Medical School	Enter when vacancy occurs	3 mornings a week for 6 weeks or 3 months; diagnosis and treatment of syphilis	6 per section	\$25 ¹⁴⁰ ⁵	The Director, Columbia University School of Medicine, 309 East 20th Street, New York City
	Enter when vacancy occurs	3 mornings or afternoons a week, 6 weeks or 3 months; clinical	20 per section	\$40 ⁷⁵ ^{10, 6}	
	Enter when vacancy occurs	3 afternoons a week for 6 weeks or 3 months; practical instruction in dermatologic allergy and immunology	3 per section	\$40 ⁷⁵ ⁸

Stokes, Director, Institute for the Control of Syphilis, Hospital of the University of Pennsylvania, 3400 Spruce Street, Philadelphia, Pa.

1. Male physicians only.

2. Physicians with adequate preliminary training and/or approved by the post graduate department are eligible.

3. Registration fee of \$5 covers all courses taken within 12 months.

4. Limited to specialists who have had preliminary training and experience.

5. A laboratory fee of about \$5 will be added.

6. If 2 or more students register for the course at the same time, a reduction in the fee will be made.

7. Special parts may be taken.

8. Upon application by physicians otherwise unable to meet the expense of post graduate study, grants to defray part of the tuition are made from a scholarship fund.

9. A bond of \$500 is required.

10. If two or more sections are taken, the fee will be reduced.

11. A course for students of mental institutions the next course below/above (Gastroenterology) the combined course will be \$125.

12. Register two to six weeks in advance.

13. May not be offered.

14. Negro physicians in good standing are eligible.

15. For physicians from Washington, Oregon, Montana, Utah, Province of British Columbia.

16. Members of the several Medical Corps will be admitted free of charge.

17. Applications will be accepted in the order of their receipt.

18. A course for Emergency Medical Service officers and selected physicians.

19. For state physicians. Some out of state physicians accepted.

20. State boards of health furnish funds covering tuition fees, maintenance, or transportation for physicians of the state.

21. All or part refunded on satisfactory completion of the course.

22. White registered physicians, practicing in the state.

23. Physicians recommended by the District Medical Societies who have not received a stipend for a course in the same subject within 1 year.

24. Tuition refunded if the war interferes.

25. There are some opportunities to work in hospitals or laboratories situated within the tropics.

26. Out of state physicians will be expected to pay their board.

27. Plus a matriculation fee of \$5.

28. Plus a matriculation fee of \$10.

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various centers, June 22-24. *Part III*. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Oral*. Groups A and B, Cleveland, Jan. 14-15, 1943. Final date for filing application is Dec. 7. *Written*. Various centers, Nov. 16. Final date for filing application is Oct. 5. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: June, Philadelphia, in advance of the meeting of the American Medical Association. Application should be on file 6 weeks in advance of the date of oral examination. *Written*. Oct. 19. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. New York, May 12-13. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral*. Baltimore, June 6, and Philadelphia, June 8. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: *Oral and Written*. Chicago, Jan. 9-10. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 3503 Prytania St., New Orleans.

AMERICAN BOARD OF RADIOLOGY: Locally, Sept. 18. *Oral*. Chicago, Nov. 23. Final date for filing application is July 1. Sec., Dr. C. A. Aldrich, 707

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY: New York, December. Final date for filing application is Oct. 1. Sec., Dr. Walter Freeman, 1028 Connecticut Ave. N.W., Washington, D. C.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Notice to City as Prerequisite to Suit for Malpractice.—The municipal law of the city of New York imposes liability on the city for any damages resulting from the malpractice of a physician while rendering gratuitous services to a person in a public institution maintained by the city. It further provides that no action may be maintained against the city or the physician unless the notice requirements of the law are strictly complied with. Notice of intention to commence an action against the city is required to be served on the city within six months after the cause of action accrues. On July 6, 1937 the plaintiff, a charity patient in the Fordham Hospital, underwent an appendectomy performed by the defendant physician. A gauze pad was left in the plaintiff's abdominal cavity. In January 1938 the presence of the pad was discovered and removed by another physician. Subsequently the plaintiff filed suit against the defendant physician for malpractice and on April 26, 1938, more than two months after the action was commenced, served the required notice on the city. The defendant physician filed a motion to dismiss the complaint and, from an adverse judgment, appealed to the supreme court, appellate division, first department, New York.

The plaintiff admitted that notice had not been served on the city within the required six months period but contended that her substantial compliance with the law was sufficient. She testified that she did not know of the existence of the pad in her abdominal cavity until it was removed in January 1938, and that she was then advised by the physician who removed it that she could not sue because she was a charity patient. She also testified that she underwent a hernia operation in March 1938 and was confined to her home until April 22. The plaintiff argued that these facts excused a strict compliance with the notice provision and that she served the notice as soon as she was able to do so. The appellate division pointed out that in a former appeal of this same case (*Derlicka et al. v. Leo et al.*, 22 N. E. (2d) 367, J. A. M. A. 115:2023 [Dec. 7] 1940) it had been held that a strict compliance with the notice provisions was required in a suit of this nature. Even if a substantial

compliance was sufficient, the court added, the plaintiff's proof did not indicate that degree of compliance. Her testimony showed that she was at home and in her right mind on and after March 22, 1938. She could have served the notice then, either personally or by her attorney. The fact that she did not discover the malpractice for some time did not aid her, because the right of action arose at the time the negligent act was committed whether the plaintiff knew of the negligence or not. The judgment for the plaintiff was therefore reversed and the defendant's motion to dismiss granted. The Court of Appeals affirmed the judgment of the lower court in dismissing the complaint.—*Derlicka v. Leo*, 19 N. Y. S. (2d) 949 (N. Y., 1940); 31 N. E. (2d) 47 (N. Y., 1940).

Medical Practice Acts: Use of Heat Treatment by Chiropodists.—Section 24 of the medical practice act of Illinois penalizes any person who holds himself out to the public as being engaged in the diagnosis or treatment of human ailments; or who suggests or prescribes any form of treatment for the cure or relief of any physical or mental ailments of any person with intent of receiving a fee or compensation therefor; or who shall diagnose, operate on, profess to heal or treat human ailments or maintain an office for such purpose, if he does not "then possess in full force and virtue a valid license issued by the authority of this state to practice the treatment of human ailments in any manner." The defendants, licensed chiropodists, were charged, in two separate suits which were later consolidated, with having violated the foregoing section in that they applied heat to a patient's arm and treated the blisters which resulted by the use of a hypodermic syringe, a surgical knife and the application of salve. The evidence showed that the complaining witness, accompanied by a friend, went to the defendants' shoe store and that one of the defendants wrapped a hose or cable around her shoulder, arm and wrist and turned on a machine which produced heat. After heat had been applied for some time the cable or hose was removed and it was discovered that four or five blisters had resulted from the treatment. One of the defendants opened two of the blisters with a knife, applied a green salve, bandaged the arm and directed the patient not to remove the bandages for two or three hours. On completion of the treatment, the patient paid the defendant \$5 to cover the initial treatment as well as one future treatment. Because of pain caused by the blisters, the patient returned to the defendants for treatment, one of whom then used a hypodermic syringe to draw liquid from the blisters, washed the burns, applied green salve to the sores and again bandaged the arm. From judgments of conviction, which were affirmed by the appellate court, the defendants appealed to the Supreme Court of Illinois.

The defendants first contended that, since they were licensed to practice chiropody, they were not persons who did not possess a license to treat human ailments "in any manner," and were therefore not violating section 24. The Supreme Court held that the defendants had clearly misconstrued the words "in any manner." Those words, said the court, require a person to have a valid license to practice the treatment of human ailments in the manner in which such treatment is practiced. The construction urged by the defendants, continued the court, would authorize a licensed chiropodist to practice surgery, or even the most intricate branches of medical treatment, simply by virtue of his chiropody license. The court therefore held, in effect, that, since the defendants were not licensed to practice as they did, it did not matter what other acts they were entitled to perform. The defendants next contended that a mere isolated instance of treatment did not prove that they were engaged in the practice of medicine. The Supreme Court said, however, that the acts enumerated in section 24 were in the disjunctive and that the commission of any one of them, without possessing the proper license, was a violation of the law. Finally, the defendant contended that the evidence was not sufficient to prove them guilty beyond a reasonable doubt. The Supreme Court held that the trial judge and jury had seen and heard the witnesses and were in a better position to determine their credibility. The mere fact that the defendants' evidence was contradictory to that of the state, said the court, constitutes no grounds for reversal. The judgments of conviction were therefore sustained.—*People v. Friedman (two cases)*, 29 N. E. (2d) 82 (Ill., 1942).

Chiropractic: Office Sign an Indication of Practice.—For over a year the defendant had maintained an office for the practice of chiropractic on the ground floor of a building located in the business section of South Tacoma, Wash. On the window facing the street was a sign which read "Thomas F. Bennett, Palmer Graduate, X-Ray, Chiropractic." Similar statements appeared in the classified section of the city telephone directory and on professional cards found in the defendant's reception room. At no time had the defendant possessed a license issued by the state board of chiropractic examiners. Subsequently he was charged with inducing a belief that he was engaged in the practice of chiropractic at a time when he was not licensed. The only witnesses at the trial were two inspectors from the state department of licenses. In addition to the foregoing facts, they testified that they visited and interviewed the defendant in his office on March 4, 1940. While they were waiting in the reception room, the defendant emerged from his private office with a lady to whom he remarked, "I will see you Wednesday." One of the inspectors stated that the defendant admitted that he had no license and that he thought it was unfair to require chiropractors to pass an examination. The other testified that during the interview the defendant said that he did not feel that he needed a license and that in fact he would not accept one if given to him, because a license would not make him capable of performing his work any better. The defendant did not offer any evidence on his own behalf, and the case was submitted to a jury. From a verdict of guilty and a judgment thereon the defendant appealed to the Supreme Court of Washington.

The defendant contended that the judgment should not stand because there was no proof that he had in fact performed any manual operation on a patient or that any one had been induced to believe that he was engaged in the practice of chiropractic. Section 10109 of Remington's Revised Statutes of the State of Washington provided:

Any person who shall practice or attempt to practice chiropractic, . . . or who shall use the title chiropractic, D.C., Ph.C., or any word or title to induce belief that he is engaged in the practice of chiropractic without first complying with the provision of this act, . . . shall be guilty of a misdemeanor. . . .

The court held that the jury was warranted in inferring not only that the defendant induced such a belief but that his inducement was successful. The defendant could not have maintained an office for so long a period without patients, continued the court, he could not have had patients unless they thought he was engaged in practice, and his advertisements could not have become known to the public unless they had been exposed as they were. The court therefore concluded that the defendant had induced a belief that he was engaged in the practice of chiropractic. The judgment of conviction was therefore affirmed.—*State v. Bennett*, 107 P. (2d) 344 (Wash., 1940).

Privileged Communications: No Waiver Implied by Statement in Application for Insurance; Admissibility of Autopsy Finding.—In his application for a life insurance policy with the defendant company, dated Oct. 6, 1933, the insured stated that he had never been under observation or treatment in any hospital, that he had never been treated for ulcer or diseases of the stomach and that no physician had treated him during the past five years. In reliance on the information stated in the application, the defendant issued a policy to the insured without requiring a medical examination. The insured died on July 21, 1935. In a subsequent suit by the beneficiary, the defendant resisted payment because of alleged false representations in the application. At the trial the defendant offered to introduce the testimony of a physician who claimed to have treated the deceased for peptic ulcer within five years prior to the date of the application. It offered another witness to testify that, within the same period, the deceased spent at least one night in a hospital. Finally it offered to show that the cause of death, as found by an autopsy, was a perforated duodenal ulcer. The admission in evidence of all this testimony was denied on the ground that it was within the protection of the laws of Iowa relating to privileged communications. The trial court directed a verdict for the plaintiff, and the defendant appealed to the Supreme Court of Iowa.

The defendant contended that any privilege which might have existed against the admission of such testimony had been waived

by virtue of the representations made by the deceased in his application for insurance and that the defendant had the right to offer evidence showing that such representations were not true. Concerning the testimony of the physician who had treated the deceased for peptic ulcer, the Supreme Court refused to hold that the privilege had been waived. The general rule, said the Supreme Court, should be that, when it appears that the relationship of physician and patient existed, the bar of the statute should be held applicable. The defendant, the court pointed out, could have inserted in the application an express waiver of the privilege or it could have required the insured to submit to a physical examination by its own physician. Since it did neither, it was bound by the existing statutory law relating to privileged communications.

The trial court erred, however, in the opinion of the Supreme Court, in refusing to permit a physician to testify that he had attended the insured within the five year period and that he took him to a hospital. That the physician attended the insured and prescribed for him involved no disclosure of any information obtained professionally. Testimony as to the cause of death as disclosed by the autopsy likewise was not privileged and should have been admitted. The relationship of physician and patient ends, the court pointed out, with the death of the patient. The judgment for the plaintiff was therefore reversed and the case remanded.—*Cross v. Equitable Life Assur. Soc. of the United States*, 293 N. W. 464 (Iowa, 1940).

Charitable Hospitals: Liability for Injuries to Special Nurse Employed by Pay Patient.—The plaintiff was a special nurse employed to care for a pay patient in the Georgetown University Hospital, which was owned and operated by the defendant corporation, an eleemosynary institution. While so employed she was seriously and permanently injured by the negligence of a student nurse in the regular employ of the hospital. The evidence showed that the hospital was one of the charitable activities conducted by the defendant and that the defendant had an insurance policy to protect itself from any loss imposed in a tort action arising out of the operation of the hospital. In a suit for damages against the defendant the jury found for the plaintiff, so the defendant filed a motion for judgment notwithstanding the verdict. The motion was heard in the district court of the United States for the District of Columbia.

The defendant contended that it was immune from liability either because it was a charitable institution or because the plaintiff was a beneficiary of the charity and therefore precluded from recovering for her injuries. The district court reviewed the history and development of the "total immunity" theory as applied to charitable institutions, from the early English cases down to the most recent decisions in this country, and held that the doctrine applied only to persons who had actually been the recipients of the bounty of an eleemosynary institution. The defendant then argued that the pay patient who employed the plaintiff was a beneficiary and that the plaintiff partook of the same status. The court said that, even assuming that the patient was a beneficiary, it did not follow that the plaintiff stood in a like relationship. Furthermore, many cases have held that a hospital is liable to a pay patient. Finally the defendant insisted that the plaintiff became a beneficiary of the defendant's charity, independently of her relationship to the patient, when she was permitted to enter on and use the defendant's premises to carry on her vocation as a nurse. To this argument the court answered that the hospital was established and maintained to provide "care and medical attention for suffering humanity," not to furnish a place for the employment of trained nurses. They were not the objects of its beneficent efforts even though the presence of trained nurses specially employed by individual patients may be essential to a hospital in fulfilling its merciful aims. Prior cases have held, the court pointed out, that the following persons were strangers to the charity of an eleemosynary institution and therefore not barred from recovering damages: a special nurse, a doctor attending a patient, a visiting husband, a visiting wife, a visiting friend, and a WPA carpenter temporarily working in a building of a charitable institution. The court therefore concluded that the defendant was not immune from liability for tortious injuries to a special nurse caring for

a pay patient in its hospital, and judgment was entered for the plaintiff on the verdict.—*Hughes v. President and Directors of Georgetown College*, 33 F. Supp. 867 (1940).

Medical Practice Act: Statutory Procedure for Revocation of License Must Be Strictly Construed.—The petitioner, a duly licensed physician in the state of New York, was charged with fraud and deceit in the practice of his profession. The charges were first heard, as required by the Education Law, by a subcommittee of the Committee on Grievances appointed by the Board of Regents of the University of the State of New York. The subcommittee reported its recommendations to the Committee on Grievances, which determined on the merits that the petitioner was guilty. Subsequently the Board of Regents followed the recommendations of the Committee on Grievances and suspended, for two years, the petitioner's license to practice medicine. From such action of the Board of Regents, which was approved by the Supreme Court, appellate division, third department, New York, the petitioner appealed to the Court of Appeals of New York.

The petitioner contended that the action of the Committee on Grievances was void because it was not strictly pursuant to statute. The law provides that after the subcommittee has heard the charges and reported to the Committee on Grievances, that committee "... shall determine said charges upon their merits (the vote of each member of said committee to be recorded as part of the committee's findings) ...". It appeared from the record in this case that the entire Committee on Grievances, consisting of ten members, met on Dec. 1, 1938 to determine the petitioner's guilt or innocence. The minutes of that meeting, however, show that only nine members voted, one member being recorded as "not voting." The respondent, Board of Regents of University of State of New York, contended that the lack of unanimity in the December 1 vote was legalized by a unanimous vote on Jan. 5, 1939, concerning the form of disciplinary action to which the petitioner should be subjected. The Court of Appeals refused to sustain that contention, however. It pointed out that rigid qualifications were required to be met before a license to practice medicine could be obtained and that such a license, when obtained, was a valuable right that could only be taken away by following a strict statutory procedure. Since the statute required a unanimous vote by the Committee on Grievances, concluded the court, a determination of the petitioner's guilt on the basis of a nonunanimous vote did not comply with the mandatory requirements prescribed by the legislature. The order revoking the petitioner's license was accordingly reversed.—*Hilfer v. Board of Regents of University of State of New York*, 28 N. E. (2d) 848 (New York, 1940).

Accident Insurance: Carbon Monoxide Gas as "Poison."—The defendant issued a life insurance policy which provided for the payment of double indemnity if the insured suffered an accidental death not resulting directly or indirectly from poison. During the life of this policy the insured died as a result of accidental inhalation of carbon monoxide gas. In a subsequent suit by the beneficiary to recover under the double indemnity provision, the plaintiff introduced evidence tending to show that death due to the inhalation of carbon monoxide gas is the result of asphyxiation, not poison. A physician called by the plaintiff testified that carbon monoxide, when inhaled, combines with the hemoglobin in the blood and thus prevents the absorption of oxygen and its circulation throughout the body. The result was similar to death by drowning, he said, where there is suffocation because of an insufficient supply of oxygen. Furthermore, he continued, poisons are substances which, when they enter the body, destroy the tissues in whole or in part, but carbon monoxide destroys neither tissues nor cells. In conclusion, this witness stated that death resulting from the inhalation of carbon monoxide is due to asphyxia, anoxemia, lack of oxygen in the blood; not from its poisonous action. "It [carbon monoxide gas] isn't a poison. It isn't a poisonous gas. It doesn't destroy tissue." The defendant offered no testimony but cited many dictionaries, encyclopedias and medical works referring to carbon monoxide as a poisonous gas and to its effect as carbon monoxide poisoning. The lower court entered a judgment for

the plaintiff, and the defendant insurance company appealed to the Supreme Court of Missouri, Division No. 1.

The defendant contended in effect that the fact that carbon monoxide is a poison is of such common knowledge that expert testimony should not have been admitted in an attempt to prove otherwise and that the deceased should be held, as a matter of law, to have died from poison. With this contention, the Supreme Court disagreed. In the first place, if the defendant had intended to deny a recovery for death resulting from asphyxiation by gas, the court pointed out, it could easily have so stated in the policy. The test of the meaning of words commonly used should be their ordinary and popular meaning; they should not be construed in the broadest sense possible to include meanings to which they would not be applied by most people. The court expressed agreement with the Supreme Court of Michigan as stated in *Kingsley v. American Central Life Ins. Co.*, 259 Mich. 53, 242 N. W. 836, that "the natural obvious meaning of the word 'poison'—that understood by people at large"—would not include "asphyxiation" from inhaling carbon monoxide gas. Most persons, continued the court, consider a poison as being a potion containing a deadly ingredient. Webster's New International Dictionary so defines it. On the other hand, Webster's definition of asphyxia does not mention poison. The judgment for the plaintiff was accordingly affirmed, with certain modifications.—*Clearer v. Central States Life Ins. Co.*, 142 S. W. (2d) 474 (Mo., 1940).

Workmen's Compensation Acts: Cancer Attributed to Trauma.—The deceased, an employee of the Macon County Coal Company, was struck by some dislodged rock, sustaining lacerations of his lip, chin and scalp, a fractured pelvis with upward and inward displacement and a rupture of the urethra at the bladder neck. He received periodic hospitalization and medical treatment for about nine months, when a blood count showed secondary anemia. Six days later a roentgenogram disclosed a cancer of the stomach; about three months later he died. Subsequently the petitioner, wife of the deceased, was granted an award by the industrial commission, but that award was reversed on appeal to the circuit court. The petitioner appealed by writ of error to the Supreme Court of Illinois.

The employer contended that the deceased's death was caused by preexisting cancer, but the petitioner insisted that the cancer was caused by the injury which her husband had received. A physician who testified for the employer admitted that the deceased died as a result of the cancer and that trauma is a cause of cancer. He then stated, however, that he had never seen a traumatic cancer of the stomach and concluded that the deceased did not have one. This opinion was based on the absence of any injury to the deceased in the vicinity of his stomach; the evidence showed, however, that there were bruises on the deceased's hip and abdomen after the accident. The experts who testified on behalf of the plaintiff definitely stated that there was a causal connection between the deceased's injuries and the cancer. One of them, in answer to a hypothetical question, said positively that the deceased's cancer was caused by the injuries he had received. The witness further stated that in his medical practice he had treated traumatic cancer and that, although he himself had seen no traumatic stomach cancers, medical opinion agrees that they do develop and that actual cases have been reported. Ruptures causing stomach cancers, he explained, result from trauma to the pelvic portion of the abdomen and they frequently occur in a section of the abdominal cavity not directly injured.

The Supreme Court admitted that it was difficult for lay persons to decide this question when the opinions of the medical experts were so conflicting, but it held that the evidence was sufficient to sustain the decision of the industrial commission. The deceased was shown to have been healthy prior to the accident and he grew progressively ill following it. He received severe injuries, "an admittedly recognized cause of cancer," in the region where his cancer was located. The Supreme Court therefore concluded that the evidence was competent to establish that the impaired health and the subsequent death were the result of the accidental injuries. The judgment appealed from was accordingly reversed and the award of the industrial commission confirmed.—*Macon County Coal Co. v. Industrial Commission*, 29 N. E. (2d) 87 (Ill., 1940).

American Federation for Clinical Research, Minneapolis, Apr. 20-21. Dr. Thomas M. Durant, 3401 North Broad St., Philadelphia, Secretary.

American Gastro-Enterological Association, Atlantic City, N. J., June 8-9. Dr. J. Arnold Bergen, 102 Second Ave. S.W., Rochester, Minn., Secretary.

American Heart Association, Atlantic City, N. J., June 5-6. Dr. Howard B. Sprague, 50 West 50th St., New York, Secretary.

American Human Serum Association, Atlantic City, N. J., June 8. Dr. Maurice Hardgrove, 3321 North Maryland Ave., Milwaukee, Secretary.

American Laryngological Association, Atlantic City, N. J., May 25-27. Dr. Charles J. Imperatori, 108 East 38th St., New York, Secretary.

American Laryngological, Rhinological and Otolological Society, Atlantic City, N. J., June 1-3. Dr. C. Stewart Nash, 277 Alexander St., Rochester, N. Y., Secretary.

American Medical Women's Association, Atlantic City, N. J., June 6-7. Dr. Ada Chree Reid, 102 East 22d St., New York, Secretary.

American Neurological Association, Chicago, June 4-6. Dr. Henry A. Riley, 117 East 72d St., New York, Secretary.

American Ophthalmological Society, Hot Springs, Va., June 1-3. Dr. Eugene M. Blake, 303 Whitney Ave., New Haven, Conn., Secretary.

American Orthopedic Association, Baltimore, June 3-6. Dr. Charles W. Peabody, 474 Fisher Bldg., Detroit, Secretary.

American Otolological Society, Atlantic City, N. J., May 28-29. Dr. Isidore Friesner, 101 East 73d St., New York, Secretary.

American Pediatric Society, Sky Top, Pa., Apr. 30-May 2. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.

American Proctologic Society, Atlantic City, N. J., June 7. Dr. William H. Daniel, 1930 Wilshire Blvd., Los Angeles, Secretary.

American Psychiatric Association, Boston, May 18-22. Dr. Winfred Overholser, St. Elizabeths Hospital, Washington, D. C., Secretary.

American Radium Society, Atlantic City, N. J., June 8-9. Dr. Axel N. Arneson, 4952 Maryland Ave., St. Louis, Secretary.

American Society for Clinical Investigation, Atlantic City, N. J., May 4. Dr. Eugene M. Landis, University of Virginia Hospital, Charlottesville, Va., Secretary.

American Society of Clinical Pathologists, Philadelphia, June 5-7. Dr. Alfred S. Giordano, 531 North Main St., South Bend, Ind., Secretary.

American Therapeutic Society, Atlantic City, N. J., June 5-6. Dr. Oscar B. Hunter, 1835 Eye St. N.W., Washington, D. C., Secretary.

American Urological Association, New York, June 1-4. Dr. Clyde L. Deming, 789 Howard Ave., New Haven, Conn., Secretary.

Arizona State Medical Association, Prescott, May 25-30. Dr. W. Warner Watkins, 15 East Monroe St., Phoenix, Secretary.

Arkansas Medical Society, Hot Springs National Park, Apr. 27-29. Dr. W. R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

Association for the Study of Internal Secretions, Atlantic City, N. J., June 8-9. Dr. Henry H. Turner, 1200 North Walker St., Oklahoma City, Secretary.

Association of American Physicians, Atlantic City, N. J., May 5-6. Dr. Hugh J. Morgan, Vanderbilt University Hospital, Nashville, Tenn., Secretary.

California Medical Association, Del Monte, May 4-7. Dr. George H. Kress, 450 Sutter St., San Francisco, Secretary.

Connecticut State Medical Society, Middletown, June 3-4. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.

Georgia Medical Association of, Augusta, Apr. 28-May 1. Dr. E. D. Shanks, 478 Peachtree St. N.E., Atlanta, Secretary.

Illinois State Medical Society, Springfield, May 19-21. Dr. Harold M. Camp, 224 South Main St., Monmouth, Secretary.

Kansas Medical Society, Wichita, May 11-14. Mr. C. G. Munns, 112 West Sixth St., Topeka, Executive Secretary.

Louisiana State Medical Society, New Orleans, Apr. 27-29. Dr. P. T. Talbot, 1430 Tulane Ave., New Orleans, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, Apr. 28-30. Dr. Richard T. Shackelford, 1211 Cathedral St., Baltimore, Secretary.

Massachusetts Medical Society, Boston, May 26-27. Dr. Michael A. Tighe, 8 Fenway, Boston, Secretary.

Medical Library Association, New Orleans, May 7-9. Miss Anna C. Holt, 25 Shattuck St., Boston, Secretary.

Mississippi State Medical Association, Jackson, May 12-14. Dr. T. M. Dye, P. O. Box 295, Clarksdale, Secretary.

Missouri State Medical Association, Kansas City, Apr. 27-29. Mr. E. H. Bartelsmeyer, 634 North Grand Blvd., St. Louis, Executive Secretary.

National Gastroenterological Association, New York, June 3-5. Dr. G. Randolph Manning, 1819 Broadway, New York, Secretary.

National Tuberculosis Association, Philadelphia, May 6-9. Dr. Charles J. Hatfield, 1790 Broadway, New York, Secretary.

Nebraska State Medical Association, Omaha, May 4-7. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln, Secretary.

New Hampshire Medical Society, Manchester, May 12-13. Dr. Carleton R. Metcalf, 5 South State St., Concord, Secretary.

New Jersey, Medical Society of, Atlantic City, Apr. 21-23. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.

New York, Medical Society of the State of, New York, Apr. 27-30. Dr. Peter Irving, 292 Madison Ave., New York, Secretary.

New York State Association of Public Health Laboratories, Cooperstown, May 18. Miss Mary B. Kirkbride, New Scotland Ave., Albany, Secretary.

North Carolina, Medical Society of the State of, Charlotte, May 11-13. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

North Dakota State Medical Association, Jamestown, May 18-20. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.

Ohio State Medical Association, Columbus, Apr. 28-30. Mr. C. S. Nelson, 79 East State St., Columbus, Executive Secretary.

Oklahoma State Medical Association, Tulsa, April 22-24. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.

Pacific Coast Oto-Ophthalmological Society, Portland, Ore., May 11-14. Dr. C. Allen Dickey, 450 Sutter St., San Francisco, Secretary.

Rhode Island Medical Society, Providence, June 3-4. Dr. William P. Buffum, 122 Waterman St., Providence, Secretary.

Society for the Study of Asthma and Allied Conditions, Atlantic City, N. J., May 2. Dr. W. C. Spain, 116 East 53d St., New York, Secretary.

South Carolina Medical Association, Myrtle Beach, May 19-21. Dr. Julian P. Price, 105 West Cheves St., Florence, Secretary.

South Dakota State Medical Association, Sioux Falls, May 13-15. Dr. Clarence E. Sherwood, 107½ Egan Avenue South, Madison, Secretary.

Texas, State Medical Association of, Houston, May 11-14. Dr. Holman Taylor, 1404 West El Paso St., Fort Worth, Secretary.

CENTRAL SOCIETY FOR CLINICAL RESEARCH

Fourteenth Annual Meeting, Held in Chicago, Nov. 7 and 8, 1941

The President, DR. LAWRENCE D. THOMPSON,
St. Louis, in the Chair

(Concluded from page 1324)

Further Experimental and Clinical Studies on Gramicidin

DRS. WALLACE E. HERRELL and DOROTHY HEILMAN, Rochester, Minn.: The bacteriostatic effect of gramicidin and tyrocidine, the two substances obtained from a soil bacillus, has been studied by the tissue culture technic. Small amounts of gramicidin (0.0005 to 0.0025 mg.) inhibited the growth of all strains of pneumococci tested. Slightly larger amounts (0.005 to 0.01 mg.) were required to inhibit strains of hemolytic streptococci, whereas still larger amounts were necessary to prevent growth of *Streptococcus faecalis*, *Streptococcus salivarius* and the staphylococcus. Tyrocidine is much less effective than gramicidin against all of these organisms. We observed earlier that gramicidin was extremely hemolytic even in small amounts. Dubos reported that small amounts of dextrose would prevent the hemolysis produced by gramicidin. Subsequent studies in our laboratory reveal that after twenty-four hours of incubation 1 microgram per cubic centimeter of gramicidin will cause complete hemolysis of 1 per cent suspension of sheep erythrocytes in the presence of 184 mg. of dextrose per hundred cubic centimeters. No hemolysis was observed in preparations containing 1 microgram of gramicidin per cubic centimeter in the presence of 396 mg. of dextrose per hundred cubic centimeters after twenty-four hours of incubation. However, amounts of dextrose as high as 1,960 mg. per hundred cubic centimeters did not prevent hemolysis from occurring in twenty-four hours in preparations containing 100 micrograms of gramicidin per cubic

centimeter. The amounts, therefore, of dextrose necessary to prevent hemolysis are entirely out of the physiologic range.

Studies on cytotoxicity have been made with an amount of gramicidin (5 micrograms per cubic centimeter of tissue culture mediums) which is bacteriostatic for pneumococci and hemolytic streptococci. This amount does not appear to inhibit the migration of lymphocytes or macrophages or to inhibit the normal growth of fibroblasts. Since this amount of gramicidin is actively hemolytic for erythrocytes suspended in the same medium, it appears that the hemolytic effect of gramicidin accounts for a good deal of its toxicity for animals.

For clinical purposes the crude substance tyrothricin has been used. Because of the apparent toxicity, it has not been administered by mouth or intravenously. The substance has been applied locally and has been instilled into body cavities, including the paranasal sinuses, the urinary bladder and the pleural cavity. In general, lesions infected with hemolytic streptococci and *Str. faecalis* have responded more favorably than conditions in which staphylococci were present. This parallels the results noted in the bacteriostatic studies. The preparation used was a solution containing 400 micrograms of tyrothricin per cubic centimeter. Tyrothricin has been used in treatment in 50 clinical cases. In 14, sinusitis was present. In 6 cases of cystitis and 4 of empyema, tyrothricin was used in treatment. The remainder of the cases formed a miscellaneous group including cases of infected postoperative wounds, infectious dermatoses and stasis ulcers. The response was somewhat irregular, but for the purpose of analysis the results fall into three general groups: good, fair and poor. The results could be considered good in less than half (43 per cent) of the cases. Clinical results could be considered no more than fair or temporary in a fourth (25 per cent) of the group. Failures or poor results were observed in a third (32 per cent) of the cases.

Use of Sulfaguanidine in Nonspecific Ulcerative Colitis and Other Infections of the Bowel

DR. JOSEPH B. KIRSNER, ENID C. ROBANICHE, PH.D., and DR. WALTER L. PALMER, Chicago: Sulfaguanidine was found by Marshall and his co-workers to be fairly soluble in water and poorly absorbed from the bowel and to reduce the number of coliform organisms in the feces of mice. Large quantities of this drug were given by us to a series of 20 patients, including 12 with nonspecific ulcerative colitis, 2 with acute bacillary dysentery, 2 with lymphogranuloma venereum of the bowel and 4 with miscellaneous infections of the intestinal tract.

Sulfaguanidine, while not as readily absorbed from the bowel as other sulfonamide derivatives, was, nevertheless, absorbed to some extent; when 10 to 15 Gm. of the drug was given daily the level of total sulfaguanidine in the blood reached 10 mg. per hundred cubic centimeters. The bacterial count of the feces usually was decreased considerably and the flora transformed from one predominantly coliform in type to one composed entirely of gram-positive organisms. The bacterial content of the feces increased rapidly when chemotherapy was discontinued.

Toxic reactions occurred in 4 cases in this series and consisted of localized or generalized cutaneous lesions. Evidence of a toxic effect on the bone marrow was noted in 1 instance. There was usually a decrease in the leukocyte count, and occasionally a diminution in the red cell level occurred. Varying quantities of crystalline *N*-acetylsulfanilylguanidine were found in the urine in cases in which it was sought for.

Sulfaguanidine therapy appears to be of value for acute bacillary dysentery but not for paratyphoid B infection. It apparently has no advantage over other sulfonamide derivatives in the treatment of lymphogranuloma venereum. The continued use of sulfaguanidine over a long period may be beneficial in the treatment of chronic nonspecific ulcerative colitis.

With regard to bacillary dysentery, we have been much interested in the susceptibility of *Shigella paradysenteriae* to these sulfonamide drugs in vitro. We have observed that all cultures tested by us grew out within forty-eight hours in a medium containing 200 mg. of sulfaguanidine per hundred cubic centimeters. However, with sodium sulfathiazole organisms of the Flexner group require about twenty days to grow in a medium with a concentration of 20 to 30 mg. per hundred cubic centi-

mers, but those of the Sonne group are less susceptible to sodium sulfathiazole. They grow out normally in twenty-four hours in a medium containing 1 mg. per hundred cubic centimeters of sodium sulfathiazole, in one week in one containing 80 mg. and in two weeks in one containing 150 mg. These observations would indicate that the bacteria of the *Shigella* group are less susceptible in vitro to sulfaguanidine than to sulfathiazole.

DISCUSSION

DR. M. L. COOPER, Cincinnati: I raised a question concerning the high levels of the drug in the blood which Dr. Palmer obtained and the possible influence of ulcerations of the intestinal tract on such high levels. Marshall's studies indicated that the drug is absorbed only slightly from the intestinal tract, produces low levels in the blood and builds up high intestinal drug levels; hence he thought it would be a good therapeutic agent in bacillary dysentery. During the past summer my associates and I observed 1 child with ulcerative colitis. At the time this child was admitted to the hospital he had severe bloody diarrhea; the diagnosis was dysentery, and he was given sulfaguanidine. The following day when we obtained a report regarding the level of the drug in the blood we were surprised to find that it was 10 mg. per hundred cubic centimeters. We had not been obtaining levels in children above 2 mg. The next day the level in the blood was 11.7 mg. Therapy with the drug was then stopped. Further study revealed that the patient had ulcerative colitis. Later the child was again given sulfaguanidine, and high levels in the blood were again obtained. The question then arose regarding the influence of ulcers of the intestinal tract on the absorption of this drug. It seemed likely that the high levels obtained in this child might be due to increased absorption through the ulcerative processes. If ulcerations facilitate greater absorption of sulfaguanidine, it may be that extraordinarily high levels in the blood should lead one to think of the possibility of an ulceration of the intestinal tract when an ulceration may not otherwise be suspected.

DR. H. MARVIN POLLARD, Chicago: I should like to ask Dr. Kirsner if in severe ulcerative colitis the patients have had improvement, improvement either in temperature or in the number of stools, and if he noticed an increase in the number of stools in those who did not show improvement.

DR. JOSEPH B. KIRSNER, Chicago: The mechanism responsible for the high levels of the drug in the blood is not apparent. Dr. Cooper's explanation seems plausible. We have attempted to be cautious in the interpretation of our results in the treatment of ulcerative colitis because it is a disease which is characterized by spontaneous remissions not attributable to specific therapy. We thought that, in the 4 cases in which it was considered that improvement occurred, the drug did have something to do with the improvement. The clinical change was characterized by a return of the temperature to normal and by a decrease in the number of stools. The stools became better formed, and there was also improvement in the proctoscopic appearance of the rectal mucosa. In cases in which improvement did not occur during sulfaguanidine therapy we did not observe an increase in the number of stools.

Combining Drug to Stimulate the Human Colon

HARRY F. ADLER, PH.D., and DRs. A. J. ATKINSON and A. C. IVY, Chicago: Four adults with colostomy served as subjects in experiments conducted to find combinations of stimulating drugs which would supplement one another or act synergistically to stimulate the colon. Prostigmine or physostigmine combined with solution of posterior pituitary have supplementary action. Prostigmine and ergotamine act synergistically. The simultaneous injection of small amounts of solution of posterior pituitary, prostigmine and ergotamine resulted in strong propulsive and nonpropulsive colon motility with repeated evacuations of gas and material. Most important is the fact that this strong action on the colon was not accompanied by side effects.

DISCUSSION

DR. LOUIS N. KATZ, Chicago: Did ergotamine increase the effectiveness of propulsion of solution of posterior pituitary and prostigmine? A glance at the tables presented fails to demonstrate that this was so.

DR. ARTHUR J. ATKINSON, Chicago: I am sorry that I did not emphasize that point. Ergotamine did increase the effect of solution of posterior pituitary and prostigmine. Ergotamine of itself did nothing. I did not point out that the effects we obtained with ergotamine and prostigmine were achieved with one-half the dose that we used in the experiment with prostigmine alone. I have not said anything about the clinical application, and it remains to be seen whether combinations of these drugs clinically will produce propulsive motility as it is seen in the normal colon. We are using patients with a normal colon and not those with adynamic ileus or with megacolon.

Treatment of Hepatic Cirrhosis with Choline Chloride and Diet Low in Fat and Cholesterol

DRS. G. O. BROWN and R. O. MUETHER, St. Louis: In experiments on the production of atherosclerosis in rabbits by means of diets high in cholesterol the development of a fatty liver was uniformly observed, and in prolonged experiments a number of animals showed hepatic cirrhosis. Administration of choline decreased the severity of fatty hepatic changes. We observed the experiments of Griffith on the effects of diets low in choline. In rats subjected to such diets a fatty liver develops. Administration of choline will prevent such fatty changes, and administration of the amino acid methionine will give a similar protective action. Addition of cholesterol to low choline diets appears to increase the toxic effects.

On these bases we have been treating patients with hepatic cirrhosis for more than two years by the administration of choline chloride in a dose of 1 Gm. daily and by giving diets low in animal fats and cholesterol. The daily intake of fat was limited to approximately 70 Gm. The protein content of the diet was increased to as much as 100 Gm. daily in cases in which the plasma proteins were depleted. This protein was largely supplied as skimmed milk since casein has a high methionine content. The remainder of the caloric requirement was supplied by carbohydrate. Fish liver oil concentrates were added as supplementary sources of vitamins A and D.

A number of patients with portal cirrhosis of the liver have responded well to this method of treatment. Elimination of ascites, decrease in the size of the liver, increase in plasma proteins with return of the albumin-globulin ratio to a more normal level, improvement in anemia, increased bromsulphalein elimination, raised hippuric acid synthesis and decrease in blood bilirubin and blood cholesterol were among the evidences of clinical improvement secured. Persistence in treatment is necessary. One patient, who had ascites for eighteen months requiring eighty-nine paracenteses, after fourteen months of treatment has remained completely free from ascites for more than ten months. While we have no doubt that the diet alone is beneficial, 1 patient was treated by the use of the diet, diuretics and plasma transfusions for about six months without much improvement. Continuation of the diet with the addition of choline resulted in disappearance of the ascites after this had been present over a year. It has not recurred in the last four months.

DISCUSSION

DR. WALTER L. PALMER, Chicago: The interesting report presented illustrates the importance of trying to do something for patients with cirrhosis of the liver and ascites. The clinical and pathologic evidence that alcohol plays a primary role in cirrhosis of the liver is becoming more convincing. It is difficult to evaluate such factors as choline and cholesterol. We have had in the past year one experience similar to that reported by Dr. Brown, in a patient with cirrhosis and ascites who regained a satisfactory state of health after the institution of a high carbohydrate-low fat diet. In this case, because of certain recent experiments we used brewers' yeast in large quantities. I wonder if Dr. Brown has tried yeast. The question arises whether choline or yeast is of any more value than diet.

DR. HENRY T. RICKETTS, Chicago: Dr. Brown has shown that he can influence ascites by this method. I am not sure, however, that he has shown he can influence cirrhosis, except possibly in the 1 case in which the liver decreased in size. It is difficult to conceive how the administration of choline or a low fat diet could alter the process of fibrosis once it has become firmly established. It is well known that fatty infiltration can

be prevented by appropriate means, but how a nodular and fibrotic liver can be reduced in size is a question which needs explanation.

DR. G. O. BROWN, St. Louis: In these cases we have not used yeast in large quantities. In the second case we tried vitamin B concentrates in large quantities for several months. During this period there was no improvement. I admit that the question whether equally good results might be secured by treatment with diet alone is unsettled. We have, however, handled several patients with diet alone, some of whom have improved. It is my impression that these patients as a group have not done as well as those receiving choline also. That remains for future demonstration. Regarding diet, it may be recalled that the second patient was treated with diet alone for many months without improvement, but he seemed to respond when choline was added. The third patient was treated with both choline and diet for several months before there was improvement. I do not think the portion of the liver that has undergone advanced fibrotic changes will be influenced by such treatment as we have used. If the cirrhosis has not gone so far and some portions of healthy tissue remain, it is known that the liver has tremendous regenerative activity. Given favorable conditions, in time the healthy liver tissue may regenerate and some improvement in hepatic function will occur. Of the cases studied, in 2 there was a decrease in the size of the liver. There was also definite improvement in the jaundice in 1. Ascites disappeared in all 4 cases reported.

Relationship of Steroids of Adrenal Cortex to Shock

DR. S. C. FREED, I. SHLESSER and E. LINDNER, Chicago: The adrenal cortex is known to protect the animal against the development of secondary shock after trauma, infection or the administration of pharmacologic agents. Adrenal cortex steroid therapy has been suggested for use in the treatment of these conditions. There is evidence that the response of the peripheral vascular system is involved in this relationship. For this reason adrenal cortex preparations were studied for their effect on capillary permeability by Menkin's "leukotaxine" method. Crystalline corticosterone and commercial adrenal cortex extract were found to prevent the increase in skin capillary permeability which follows leukotaxine administration. Crystalline desoxycorticosterone was unable to do so. It is of considerable interest that compound E, which closely resembles corticosterone both physiologically and chemically, is unable to neutralize the effect of leukotaxine.

These experimental results may explain the qualitative differences in the effects of the various adrenal cortex preparations in the treatment of shock. Thus, desoxycorticosterone is capable of combating the shock due to muscle trauma, water intoxication and intraperitoneal injections of dextrose solution but not that following intestinal manipulation, while corticosterone is of benefit in treating the shock following intestinal manipulation. This indicates that a toxic factor similar to leukotaxine may be elaborated by trauma to the intestine resulting in an increased capillary permeability, while the other forms of shock may be due principally to extreme shifts of body fluids unrelated to capillary changes.

DISCUSSION

DR. EDWARD H. RYNEARSON, Rochester, Minn.: In view of the publicity being given the use of adrenal cortex extract and desoxycorticosterone acetate in the prevention and treatment of shock it is more than ever imperative that studies such as the one presented should be carried out. Keating, Power and I have presented our studies on the use of desoxycorticosterone acetate in the prevention of surgical shock. Observing its effect in women about to undergo the radical removal of breasts, we were unable to detect any clinical or laboratory changes in patients receiving this substance as compared with normal controls. This study was not performed with adrenal cortex extract, and it was not tried with any operations other than radical mastectomy.

DR. LOUIS N. KATZ, Chicago: Drs. Killian and Perlow, Mr. Asher and I have been using desoxycorticosterone in another type of experiment. We have found that occlusion of the main veins to the limb will lead to death of an animal in four to twelve hours with the symptoms of shock. We have

demonstrated that this shocklike state is due to the accumulation of fluid in the animal's leg. We have found, in as yet unpublished results, that the preliminary use of desoxycorticosterone tends to prevent death and tends to alleviate shock in such animals. It seems from our results, therefore, that desoxycorticosterone is of value in the treatment of the form of shock due to loss of plasma fluids, and its use would be justified clinically as a prophylactic agent. The demonstration of its use by clinical investigation is unsatisfactory, since one cannot predict which patient will have shock. Furthermore, our animal experiments suggest that it cannot be used effectively after shock has appeared. Not all forms of shock may be due to the same mechanism, so that desoxycorticosterone therapy may not be effective in all. I am sure that as knowledge grows the rationale for use of desoxycorticosterone as well as of other suggested therapeutic agents in shock will gradually become clearer.

DR. S. C. FREED, Chicago: On a theoretical basis the use of desoxycorticosterone in the treatment of shock would be appropriate when there is fluid loss unrelated to any factor which renders the capillaries more permeable. When such factors exist, as after injury to the intestine, then either natural cortex extract or corticosterone, the substance in the extract which is probably responsible for the reduction in permeability of the capillaries, is indicated.

Treatment of Edema with an Oral Mercurial Diuretic

DR. JOSEPH F. BORG, St. Paul: Thirty-nine patients with edema were given orally tablets of a complex mercury compound, sodium salicyllallylamide-o-acetate, with theophylline (salyrgan-theophylline tablets) to determine their diuretic effect. Each tablet contained 0.08 Gm. of salyrgan (containing 0.031 Gm. of mercury) and 0.04 Gm. of theophylline. The patients included 19 men and 20 women from 40 to 80 years of age. Maintenance doses of digitalis were given to patients with heart disease, and 6 Gm. of ammonium nitrate was given daily to all patients. All patients were maintaining stationary weight levels before the therapy was started, and results were judged by the water loss shown by daily weight determinations. Varying methods of administration revealed that best results, with the least toxicity, were obtained with divided daily doses, usually six tablets daily. Observations made over periods as long as sixteen months revealed excellent results in 28 patients, fair in 5 patients and none in 6 patients. Men and women responded equally well. Varying toxic manifestations (nausea, diarrhea, weakness and abdominal pain) occurred in 15 patients but were severe enough to necessitate the discontinuance of therapy in only 3 patients. No renal or hemic complications were noted. The 6 failures reported occurred among the patients treated earlier and 5 were probably due to an inadequate dose. Only 1 patient failed to respond when an apparently adequate trial was given.

DISCUSSION

DR. WILLIAM H. BUNN, Youngstown, Ohio: There are several reasons why this might be a useful remedy. I shall discuss only one. It is often difficult to find a vein suitable for intravenous injection in an obese or an edematous person. Formerly rectal suppositories of the mercurial diuretic were used with good effect, but this practice has had to be discontinued because of toxic effects. I have used the preparation for 16 patients with only one severe reaction (hematemesis); there were several other milder evidences of intolerance. It would seem worth while to continue this experiment, for most patients have a satisfactory diuretic effect.

Diagnostic Value of Certain Studies of Renal Function in Cases of Addison's Disease

DRS. E. J. KEPLER and F. J. ROBINSON and M. H. POWER, PH.D., Rochester, Minn.: Two comparatively simple diagnostic procedures based on renal function eliminate the necessity of salt deprivation in patients suspected of having Addison's disease. The two tests are conducted in the following manner: The day before the test the patient eats his usual three meals but omits extra salt. After 6 p. m. he does not eat or drink. At 10:30 p. m. he voids and discards the urine. All urine

voided from 10:30 p. m. until and including 7:30 a. m. is collected, measured and saved for chemical analysis if this proves necessary. At 8:30 a. m. the patient voids again (if possible) and discards the urine. Immediately thereafter he is given 20 cc. of water per kilogram of body weight, or 9 cc. per pound, in the course of forty-five minutes. He is asked to void at 9:30, 10:30 and 11:30 a. m. and 12:30 p. m. Each of the specimens is measured. At 11:30 a. m. or 12:30 p. m. (the exact time is inconsequential) blood is drawn under oil for chemical analysis if the necessity for such studies appears likely, as by this time the results of this first procedure usually will be apparent.

The first procedure is concluded by comparing the volume of urine voided during the night with the volume of the largest single hourly specimen voided between 8:30 a. m. and 12:30 p. m.; the second procedure, by analyzing the urine voided during the night and the blood for the concentrations of urea and chloride. A ratio is calculated from the values obtained in these four determinations.

From a study of 90 patients (40 of whom were proved by salt deprivation and by the Cutler, Power and Wilder procedure to have Addison's disease) it was ascertained that if the volume of urine which was voided during the night was less than the volume of urine voided at any one hour during the morning the patient did not have Addison's disease. If, on the other hand, the volume of urine voided during the night was greater than the volume voided at any one hour during the morning the patient might or might not have Addison's disease, and the chemical analyses which constitute the second procedure were necessary. Under the latter circumstances the following ratio is calculated from the results of the four chemical determinations (the volume of day urine being the largest of the hourly specimens voided during the day and the volume of night urine being the entire amount voided between 10:30 p. m. and 7:30 a. m.):

$$A = \frac{\text{urea in urine (mg. per 100 cc.)}}{\text{urea in plasma (mg. per 100 cc.)}} \times \frac{\text{chloride in plasma (mg. per 100 cc.)}}{\text{chloride in urine (mg. per 100 cc.)}} \times \frac{\text{volume of day urine (cc.)}}{\text{volume of night urine (cc.)}}$$

In nearly all instances in which the value for *A* did not exceed 25 the patient was found to have Addison's disease. Values for *A* of more than 30 indicated the absence of Addison's disease. The only exceptions encountered occurred in cases of nephritis. In conjunction with clinical evidence, the procedure proved to be decisively diagnostic in cases in which the presence of Addison's disease was proved by other methods.

DISCUSSION

DR. PAUL STARR, Chicago: Dr. Kepler and his associates should be congratulated for working out so simple a diagnostic test. Many potent endocrine substances are on the market, and physicians are urged to use them, with the result that a great deal of therapy is carried out which is dangerous to the patient. I am grateful for any procedure which will definitely indicate the need for therapy and which will also definitely show the conditions not requiring treatment.

The Bronchial Factor in Pulmonary Embolism

DRS. JOSEPH H. JESSER and GEZA DE TAKATS, Chicago: The bronchial tree of the dog was visualized, and the effect of pulmonary embolism on the pattern of the bronchial tree was studied. It was found that powerful bronchoconstriction was produced during embolism, which could be abolished by bilateral vagal section and often by sufficient doses of atropine. Mechanical obstruction to the trachea failed to produce bronchial spasm. Papaverine failed to protect the bronchial tree from this reflex spasm in most instances. These experiments emphasize the existence of widespread autonomic reflexes which occur within the distribution of vagal fibers. The suppression of these reflexes decreases the morbidity and mortality from pulmonary embolism.

Current Medical Literature

AMERICAN

The Association Library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Clinical Pathology, Baltimore 12:1-72 (Jan.) 1942

- *Benign and Malignant Stromal Endometriosis. T. D. Robertson, W. C. Hunter, Portland, Ore.; C. P. Larson, Tacoma, Wash., and G. A. C. Snyder, Spokane, Wash.—p. 1.
Sputum Studies in Pneumonia: Effect of Sulfapyridine and Sulfabiazole. A. W. Frisch, with technical assistance of Miriam F. Frisch, Detroit.—p. 16.
Relation Between Liver and Thyroid Gland: I. Blood Iodine as Indicator of Liver Function. A. Cohn and S. E. Feldman, San Francisco.—p. 27.
Morphologic Variations in Adenocarcinoma of Fundus of Uterus, with Reference to Secretory Activity and Clinical Interpretations. N. W. Elton, Buffalo.—p. 32.
New Standard Slide Test Antigen (Water Purified). B. S. Kline, Cleveland.—p. 48.
Adventitious Substances Removed from Slide Test Antigen by Extraction with Water. Miriam S. Levy, Cleveland.—p. 62.
Drainage of Coronary Sinus into Left Auricle: Report of Rare Congenital Cardiac Anomaly. L. E. Fieldstein and J. Pick, New York.—p. 66.

Stromal Endometriosis.—Robertson and his associates discuss the nature of benign and malignant stromal endometriosis as they observed it in 6 instances. The malignant form is interpreted as a low grade sarcoma. Uterine adenomyosis and stromal endometriosis are variants of the same process originating by extrusion of the endometrium into the myometrium. A case is cited in proof of this assertion. Adenomyosis is the more frequent manifestation. After the menopause, stromal endometriosis may either continue to grow or, as in 1 of their patients, regress. This is unlike glandular endometriosis, which always becomes inactive when ovarian function ceases. Microscopically, stromal endometriosis presents a characteristic and readily identifiable picture.

American J. Digestive Diseases, Fort Wayne, Ind. 9:1-48 (Jan.) 1942

- Clinical and Laboratory Study of Plasma Lipids in Obstructive Jaundice and Several Types of Hepatic Disease. C. A. Jones, Philadelphia.—p. 1.
Comparative Evaluation of Newer Liver Function Tests: (Comparison of Intravenous Hippuric Acid Test, Cephalin-Cholesterol Flocculation Test, Colloidal Gold Test and Serial Bromosulphalein Test with Oral Hippuric Acid Test and Rosenthal Bromsulphalein Test). J. G. Mateer, J. I. Baltz, D. F. Marion and R. A. Hoffands, with assistance of Elizabeth M. Yagle, Detroit.—p. 13.
*Genesis of Pellagra, Pernicious Anemia and Sprue. S. Harris and S. Harris Jr., Birmingham, Ala.—p. 29.
Study of Sphincter of Oddi in the Human and the Dog. H. Necheles and D. D. Kozell, Chicago.—p. 36.
Effect of Food on Sphincter of Oddi in Human Subjects. G. S. Bergh, Minneapolis.—p. 40.
Porphyrinuria in Aged. H. A. Rafsky and B. Newman, New York.—p. 43.
Lymphosarcoma Causing Obstruction at Duodenojejunal Angle: Report of Case. H. J. Svien and A. B. Rivers, Rochester, Minn.—p. 45.

Pellagra, Pernicious Anemia and Sprue.—The HARRISES believe that pernicious anemia, pellagra and sprue are three separate and distinct diseases despite the fact that some symptoms are common to all three and that use of liver or liver extract and a high protein, low carbohydrate diet rich in vitamins is effective. Pernicious anemia differs only in that liver or liver extract therapy must be continued for the rest of the patient's life. Hepatic insufficiency appears to be a factor in the genesis of pellagra, pernicious anemia and sprue. The liver may secrete hormones. Research workers who are prepared to make biologic laboratory investigations may prove or disprove (1) that hepatic insufficiency is the underlying factor in

pernicious anemia and (2) that hormones secreted by the liver may be factors in erythrocytolysis or hemopoiesis. Identical pathologic changes are found in the liver in pernicious anemia and pellagra. It seems possible that hepatic insufficiency by inhibiting the secretion of an endocrine substance which controls erythrocytolysis or hemopoiesis may cause pernicious anemia and that a deficiency of an intrinsic hepatic factor may prevent the utilization or the storage of nicotinic acid, the pellagra preventive factor in vitamin B. Greenspon and Morris suggest a gastric hormone as the intrinsic factor in preventing pernicious anemia. The authors cite instances in which pellagra and pernicious anemia, sprue and pernicious anemia or pellagra, sprue and pernicious anemia coexisted. This suggests common etiologic factors. The frequency of intestinal parasites in anemic patients with pellagra, pernicious anemia or sprue suggests that the intestinal toxemia and hepatic insufficiency may be etiologic factors in some cases.

*Coagulation Globulin in Hemorrhages After Extraction of Teeth, Especially in Hemophilic Patients. S. van Creveld and R. Hamer, Amsterdam, Netherlands.—p. 628.

Coagulation Globulin for Postextraction Hemorrhage.—Van Creveld and Hamer controlled in 6 patients hemorrhage following the extraction of teeth with a powder of coagulation globulin prepared from cow's plasma. Four of the patients had hemophilia, 1 had a history of repeated hemorrhages after tooth extraction and 1 had a moderately prolonged coagulation time, which explained a severe hemorrhage after a former extraction. Coagulation globulin powder, which in the normal blood may be the carrier of the coagulation promoting factor, has a definite hemostyptic activity. When a patient with hemophilia is to have an extraction he should be hospitalized. The wound after extraction should be sprinkled with coagulation globulin and a tampon slightly moistened with saline solution applied. This is to be thickly covered with coagulation globulin powder. The tampon should be pressed on the wound by a finger for four to six minutes. It should be renewed every twenty-four hours after the wound has been cleansed. The repeated application of the powder may cause hypersensitivity. Although the risk of this complication is small, the authors intend in the future to use a coagulation globulin powder prepared from human plasma or from the human placenta.

27:667-744 Orthodontics (Dec.) 1941. Partial Index 667-746 Oral Surgery Orthodontics

- *Effects of Congenital Syphilis on Teeth and Associated Structures in Children. W. D. Johnston, B. G. Anderson and P. F. McAlenney, New Haven, Conn.—p. 667.
First Aid Appliance for Treatment of Fractured Jaw. T. W. Sorrels, Oklahoma City.—p. 714.

General Anesthesia for Oral Operations. S. C. Wiggin, Boston.—p. 704.
Secondary Repair of Cleft Lips and Their Nasal Deformities. J. B. Brown and F. McDowell, St. Louis.—p. 712.

Effects of Congenital Syphilis on Teeth.—Johnston and his associates observed the effects of congenital syphilis on the teeth and oral structures of children by comparing 39 children aged 1 to 15 years who had known congenital or acquired syphilis with a positive Wassermann reaction. The medical

histories of 29 of the mothers (all with positive Wassermann and Kahn reactions) of these children were available. Histories of the children were studied with respect to lesions of teeth, eyes, ears, nose, hair and nails. In examining the oral cavity, particular attention was paid to stigmas which might be of syphilitic origin, such as malocclusion and dental caries. Gross examination of the children revealed that 6 had a "saddle nose," 1 fixed pupils and 2 impaired hearing. No intraoral pathologic lesions of the soft tissues were observed. Direct measurement of roentgenograms of the first and second permanent molars disclosed that the second molar of 20 was larger than the first molar and that the first molar of 5 was larger than the second molar. The incisors of 1 child were the same size, while those of 10 could not be compared because of loss of the teeth. Serially cut sections, stained with Delafield's hematoxylin and alcoholic eosin, of eleven teeth from the children revealed no abnormalities attributable to congenital syphilis. The most characteristic dental abnormalities seen were (1) an apparent lack of development in the anterior region, particularly in the maxilla, (2) involvement of the four incisors, two cuspids and the two first molars of the permanent teeth, (3) a huddled appearance of the mamelons, marginal ridges and cusps of the affected teeth and (4) an undersized, malformed appearance of the crowns of the teeth. Eight of the children had a peculiar type of "open bite." The so-called Hutchinson triad (deafness referable to the acoustic nerve, interstitial keratitis and defect of the first maxillary permanent incisor) was not observed.

Results of Protozoologic Survey of Food Handlers at Professional School in Philadelphia. D. H. Wenrich and J. H. Arnett, Philadelphia.—p. 107.

Protozoologic Survey of Food Handlers.—Wenrich and Arnett state that seven annual examinations of 190 food handlers at a professional school in Philadelphia revealed that the incidence was higher for the employee than for the student group, on first examination for Blastocystis, total protozoa, Endolimax, Endameba coli, Dientameba, Chilomastix and Enteromonas. The

1,060 students had an incidence of 10.7 per cent for Endameba histolytica as compared with 8 per cent for the employees after one examination. The incidence from an average of three and two-tenths examinations for each employee was considerably higher than that for the first examination in respect to most of the intestinal protozoa. Of the six infections with Endameba histolytica detected in the employee group, four were found at the first examination, one at the fourth and one at the fifth. All of the fifteen infections with this species discovered in the students were found at the first examination. Carriers of Endameba histolytica had no more gastrointestinal symptoms than the others.

Job's Illness—Pellagra. C. J. Brim, New York.—p. 371.
*Chemical Evaluation of Superfatted Soap. R. L. Kile, Cincinnati.—p. 377.

Alopecia Areata of Dental Origin.—Complete regrowth of hair is reported by Grace in a case of extensive alopecia areata of three years' duration after several teeth, which were evidently not infected, had been extracted. The teeth contained large fillings of silver amalgam. All but two of the extracted teeth showed evidence of absorption of the filling material. The case demonstrates that improperly filled teeth may be the cause of alopecia areata.

Postclimacteric Dermatoses of Men.—Hollander and Vogel observed the therapeutic effect of the percutaneous use of androgen in the dermatoses of 8 men about and after the climacteric period. The results were most satisfactory. A preparation made from synthetic testosterone propionate was rubbed in over unaffected surfaces of the skin. The use of this substance for the treatment of presenile and senile dermatitis of men appears rational, as the cutaneous lesions in the post-climacteric period appear to be a definite entity. In some instances the generalized dermatitis followed a definite local inflammation produced by local or contact irritation. The symptoms were ameliorated only after the injections had been used.

Superfatted Soap.—Kile tested the practical use of superfatted soap and a control soap on 57 young women. The evidence indicates that more discomfort was experienced when the control soap than when the superfatted product was used. Most of the subjects who reported discomfort with either soap had dry skins. Furthermore, dryness of the skin was observed by more subjects when the control soap than when the superfatted soap was used: the ratio was 3:1 for the entire group and 4:1 for those with dry skins. A few women noticed some improvement in their acne while using the control soap but not while using the superfatted product. Women with dry skins definitely preferred the superfatted soap, while those with normal or oily skins preferred the control soap.

Distant Neuroanatomic Complications of Spina Bifida.

—From a study of several cases presenting the important neuroanatomic complications of spinal dysraphism and a review of the literature, Lichtenstein finds that in many instances of spina bifida (spinal dysraphism) there is an abnormal fixation of the spinal cord which precludes its adequate rostral migration with continued development. In some cases this abnormal fixation results in a pleomorphic variety of neuroanatomic alterations in distant parts of the nervous system. The alterations are (1) short cauda equina and low lying conus medullaris, (2) abnormal stretching of the spinal cord above the fixation, (3) elongation of the hindbrain with localization in the vertebral canal of the medulla oblongata, the choroid plexus of the fourth ventricle and parts of the cerebellum, (4) dysplasia of some of the cerebellar folia, (5) elongation of the lowermost cranial nerves with their compression at the foramen magnum by the hindbrain, (6) stenosis of the aqueduct of Sylvius, (7) internal hydrocephalus due to stenosis of the aqueduct of Sylvius and to impaction of the hindbrain, (8) deformity of the medulla oblongata and of the hind end of the fourth ventricle, (9) hydro-myelia of the uppermost cervical levels of the spinal cord, (10) syringomyelic-like cavitation in the cervical portion of the spinal cord and (11) pressure on the anterior spinal arteries and the vertebral veins at the foramen magnum.

Pyruvic Acid Studies in Wernicke Syndrome.—Wortis and his associates recently observed 34 clinical cases of the Wernicke syndrome which tend to confirm the thesis that the disorder is probably a combination of several nutritional deficiencies and is not due to alcoholism alone. Of the 34 patients, 2 were depressed and refused to eat and 1 had pulmonary tuberculosis and vomiting. Delirium, with its increase in psychomotor activity and hence total metabolism, may increase the requirement of certain of the vitamins and tends to aggravate any latent deficiency state. Other deficiency syndromes, such as pellagra, nicotinic acid deficiency encephalopathy, arboflavinosis and scurvy, may and do superimpose themselves on or accompany the Wernicke syndrome. All patients receiving adequate vitamin therapy recovered unless a concomitant complicating condition was the cause of death. In patients who recovered the Korsakoff syndrome was the rule, and it did not respond to thiamine therapy. The blood pyruvate level was determined for 11 patients. The level of pyruvate in the blood during fasting ranged from 1.44 to 3.63 mg. per hundred cubic centimeters (normal is 0.77 to 1.17 mg.), and when 7 of the patients were subjected to the additional stress of metabolizing ingested dextrose not only was the maximal rise great but the elevation above the fasting level was maintained for at least

four to five hours. The maximal increase in pyruvate did not occur during the first hour as it did in normal subjects but continued to rise until maximal values were reached as late as the fourth hour. After vitamin B therapy, the level of pyruvate in the blood during fasting rapidly returned to normal, but the pyruvic acid curve following the ingestion of dextrose returned to normal only after prolonged treatment. Ophthalmoplegia disappeared and the mental status improved in twenty-four to seventy-two hours. This improvement antedated the return of pyruvate metabolism to normal. Clinical improvement was associated with a definite fall in the level of pyruvic acid in the blood during fasting. The conclusion is that patients with the Wernicke syndrome are unable to metabolize pyruvic acid properly and that prolonged treatment with components of the vitamin B complex corrects this defect.

Convulsive Seizures and Heart Disease.—Foster states that 29 patients with convulsive seizures were encountered among 2,153 with rheumatic heart disease. No patient with an associated convulsive disorder with any suggestion of cranial trauma, syphilis, alcohol, expanding intracranial lesion, uremia or other epileptogenic factors was included in the series. This incidence of 10.76 per cent is higher than that in the general population. Acute rheumatic fever or Sydenham's chorea preceded the convulsive manifestations in 58.6 per cent of the 29 patients, the relation was doubtful in 34.4 per cent and the seizures preceded the rheumatic infection in 6.8 per cent. A familial incidence of convulsive seizures or migraine was six times as frequent among the patients with rheumatic heart disease and seizures as among those with only rheumatic heart disease. Evidence from other sources corroborates the suggestion that the seizures are more than coincidental. Inferential evidence from the common occurrence of paroxysmal cardiac arrhythmia in rheumatic heart disease and the fact that cardiac arrhythmia may be accompanied by seizures affirm the foregoing statement. Several mechanisms associated with the rheumatic state are probably capable of producing seizures in predisposed persons: paroxysmal cardiac arrhythmia, passive congestion of the cerebrum, delayed auriculoventricular conduction time (with or without the superimposition of digitalis) and cerebral infarction.

Syphilis and Cancer of Cervix.—Harding states that among 227 consecutive charity patients with epithelioma of the cervix uteri 36 were syphilitic and 191 were free from syphilis. In the syphilitic women carcinoma developed at an average age of 47 years, as compared to 51 years in the nonsyphilitic women of the series. Among the nonsyphilitic women there was a higher percentage of grade 1 carcinoma, and they showed less extensive involvement than the women with syphilis.

- Significance of Hematuria. W. H. Kinney, Philadelphia.—p. 2.
- *Observations on Kenny Treatment. G. J. Boines, Wilmington.—p. 11.

Kenny Treatment.—Since November 1941 Boines has used the Kenny method (passive and active movement and hot fomentation to relieve the spasticity of the affected muscles) for 16 patients with poliomyelitis. Five of the patients showed 100 per cent recovery within six weeks, 7 showed 90 per cent and 4 showed 75 per cent. Trained technicians are necessary to carry out the passive movements and the muscle reeducation exercises. The National Foundation for Infantile Paralysis has approved the Kenny method. It was clearly demonstrated in the author's 16 patients that no deformity, stiff joints or apparent muscular atrophy resulted. Even some long-standing uncomfortable deformities can be helped with the Kenny treatment. The bright, hopeful, cheerful effect of the treatment on the patient, parents and nursing attendants should not be overlooked. The day by day recovery of muscles is an inspiration to the nurse and to parents and promises a future recovery to the patient. The care of the patient with poliomyelitis as outlined by Sister Kenny consists in 70 per cent nursing care and medical supervision. Corrective and stabilizing operations are necessary when they are indicated. Another advantage of the treatment is that, if residual paralysis does result, the muscles are better preserved for reconstructive orthopedic surgery. The hot fomentations stimulate circulation and bring more leukocytes to the affected parts, which remove the toxins and virus from the body.

Infectious Mononucleosis.—McFarland states that to diagnose infectious mononucleosis early many conditions must be differentiated, and that when a patient has onset of fever, vomiting, pain and tenderness in the right lower quadrant of the abdomen and leukocytosis it is practically impossible to differentiate the disease from appendicitis. The author has performed appendectomy on 3 children who proved to have enlarged mesenteric nodes but not appendicitis and in whom the typical picture of mononucleosis developed later. However, more recently 1 of his patients had to have an appendical abscess drained. He suggests that perhaps mesenteric lymphadenitis is frequently if not always infectious mononucleosis. The prolonged convalescence in mesenteric lymphadenitis fits well with that of mononucleosis. An early blood smear showing only polymorphonuclear leukocytes, an elevation of the temperature higher than that usually seen in appendicitis, pain out of proportion to the tenderness and rigidity, and vomiting out of proportion to all three should suggest mononucleosis. Other nodes are likely to be enlarged, and granular pharyngitis will nearly always be present. Other members of the patient's family may later show more readily identified stages of the disease. How-

ever, in spite of all this it is still unsafe to postpone operation, but with more surgeons on the lookout it may be possible to prove or disprove the identity of any of the diseases mentioned and to make a satisfactory preoperative diagnosis.

Oral Therapy Against Ivy Poisoning.—Gold and Masucci studied the prophylactic effect of oral therapy against ivy poisoning in 20 subjects known to be susceptible. Treatment consisted in having the patient swallow tablets containing 0.5, 2, 5 or 10 mg. of poison ivy oleoresin after the noon meal. The initial dose was one half or one 0.5 mg. tablet. Treatment was given daily unless severe reactions occurred, when it was given every other day or at longer intervals. The dose was increased according to the patient's tolerance. The maximal dose, fifteen 10 mg. tablets, was reached by all but 1 patient, who took 500 mg. a day without untoward effects. After treatment, vesicles and pruritus following field tests, which were more severe than normal accidental exposure, were absent in 17 and present in 3 subjects. These observations confirm those of Shelmire that previous attempts at immunization by subcutaneous injection failed because the extracts used were not potent and the dose was inadequate. The largest amount that other investigators were able to inject was 0.5 cc. of a 1:50 solution, and this invariably produced severe local reactions. The value of oral desensitization is obvious, and the danger of contact dermatitis from handling and swallowing the liquid preparation as advised by Shelmire is removed. The tablets have retained their potency for two and five-tenths years. Large, well controlled clinical trials of the prophylactic measure should be done to determine its true usefulness.

Microscopic Changes of Muscles in Poliomyelitis.—Hipps studied at operation the muscles of patients who had had anterior poliomyelitis for two years or more. The patients were often given physical therapy for varying periods of time before some necessary standard operation was performed. The incision, however, was lengthened enough so that the muscle was visualized fully. Sections for microscopic study were removed from the most damaged part of each muscle. The microscopic evidence suggests that a gain in strength by a partially paralyzed muscle occurs not through the formation of

new fibers but through an overdevelopment or hypertrophy of the remaining undamaged cells. Pathologic changes are brought about primarily through denervation and secondarily from abnormal variations of tension in the muscle. The cellular changes from denervation begin with atrophy and progress to degeneration, disintegration and replacement changes. These pathologic stages due to secondary factors occur in muscle cells in the same way. Too much tension or overstretching results in minute tears, zonal degeneration and subsequent fibrosis, while too little tension produces changes identical with those produced by denervation. The secondary abnormalities may produce just as much weakness as the primary denervative changes. Secondary changes following immobility and disuse appear more severe than those following overactivity. Nothing much can be done for muscle cells which have lost their motor neurons and have regressed or are regressing. The knowledge that secondary changes do occur should be of practical value in planning preventive treatment.

*Effect of Yeast and Muscle Adenylic Acid in Malnourished Persons with Pellagra and Peripheral Neuritis. R. W. Vilter, W. B. Bean and T. D. Spies, Cincinnati—p. 527.

Growth of Fibroblast in Vitro.—Sano and Smith observed the behavior of the fibroblast in tissue culture at temperatures varying from 32 to 98.6 F., and on the basis of their observations they suggest that hypothermy be used more widely in wound healing. The reduction of temperature to between 77 and 86 F. gives optimal conditions for satisfactory wound healing: the cells grow vigorously, they pack closely and the circulation is slowed. Thus the products of metabolism are and remain in close contact with the cells, as the slowed blood stream is unable to carry them away. In addition the lowered

temperature is somewhat bacteriostatic and aids materially in checking infection. Finally, if epithelization is accomplished too rapidly the underlying granulation tissue tends to undergo regressive changes, the collagen contracts and a depressed secondarily contracted scar results, but if the process of repair is slowed the connective tissue is adequate in amount and compactly arranged, with relatively little collagen, and the final scar is minimal, with little or no retraction. The application of hypothermy in plastic surgery, in preventing the formation of keloid and in clearing up old lesions from osteomyelitis is a field to be investigated.

Adenylic Acid for Malnourished Persons.—Vilter and his co-workers point out that the role of adenylic acid in human nutrition is important and extremely diversified. Two to five days after daily intravenous injections of 50 mg. of adenylic acid from yeast or from muscle, ulcers in the mouths of 6 malnourished persons disappeared. In contrast, ulceration in the mouths of 3 persons with stomatitis but with no evidence of a dietary deficiency did not improve. Therapy with yeast or muscle adenylic acid to persons with *pellagrous glossitis* or subclinical symptoms of pellagra caused rapid improvement in strength and well-being and the disappearance of the burning sensation of the mucous membranes. Giving yeast adenylic acid to 6 persons with peripheral neuritis who obtained no benefit from brewers' yeast or thiamine hydrochloride brought about spontaneous relief from pain and hyperesthesia; the perception of light touch improved, and the patients were able to walk without pain. Because the therapy produced immediate reactions and concomitant electrocardiographic changes the authors do not recommend adenylic acid for general therapeutic use. Nicotinic acid, thiamine hydrochloride and a diet rich in protein and calories continue to be the most efficient therapeutic agents for most malnourished persons with ulcerative stomatitis and peripheral neuritis.

*Treatment of Congenital Clubfoot (from Birth to Four Years of Age). L. P. Roy, Quebec, Canada.—p. 16.
Metrazol and Epilepsy. G. H. LaRue and A. Pelletier, Quebec, Canada.—p. 22.

Treatment of Congenital Clubfoot.—Roy discusses the incidence, sex distribution, hereditary character and various types of clubfoot. Ombredanne divides the evolution of talipes into three periods: 1. The period of complete reducibility, dur-

ing which reduction can be accomplished by hand and without violence; this is possible up to the age of 15 days or even a year. 2. The period of relative irreducibility, during which osseous reposition is hindered by ligamentous, tendinous or cutaneous retractions but during which it is possible to remove these obstacles; this is the period between 2 and 4 years. 3. The period of absolute irreducibility, which ensues after the age of 4 years. The prognosis of congenital talipes varies with age, degree of deformity and rigidity, treatment and the period during which the child is observed, because relapse is possible even in a well reduced clubfoot. Early redressement is now almost universally applied. Some surgeons wait until the child is about a year old to perform instrumental redressement. The author thinks that early and mild manual redressement is infinitely better than the brutal manipulations and that treatment should begin when the child is 8 days old. The first deformities to be corrected are the adduction and the supination. While one hand grasps the heel, the other holds the anterior portion of the foot, and abduction is effected. Thus the internal edge tends to become convex and the external edge concave. Against supination one hand grasps the region of the ankle while the other holds the foot and turns it in order to lower the internal and raise the external border. It is necessary to respect the equinus in order to correct the first two deformities; this makes a more solid support. Up to the age of 2 or 3 months these maneuvers can be made without anesthesia; after that a little anesthetic should be given. It is better to correct a clubfoot in several sessions at intervals of several weeks than to make a redressement forcé all at once. Fixation is even more important than reduction. In the newborn, even up to 1 month, the author employs elastoplast, but some workers employ plaster of paris. If a child between 12 and 18 months of age, even perhaps up to 2 years, is brought to the physician a somewhat forced manual redressement is necessary under general anesthesia, which in about 80 per cent of the cases must be accompanied by tenotomy of the achilles tendon. A plaster of paris boot is put on for six to eight weeks and may have to be replaced later. The treatment of the period of relative irreducibility, that is, of the age between 2 and 4 years, consists in forced manual redressement followed by use of a plaster cast for two months; tenotomies of the internal lateral section are often necessary.

Prophylaxis in Epidemic Influenza.—Sulkin and Edwards state that the prophylaxis of epidemic influenza in animals and human beings with the complex vaccine containing influenza A and distemper virus, while not entirely effective, produces immunizing antibodies. The neutralizing antibodies that result from the administration of the vaccine persist for six months. Although many instances of influenza occurred in the institutions in which the authors' clinical experiments were carried on, the disease did not develop in any of the vaccinated persons.

Effect of Mineral Water on Tests of Renal Function.—Muether and his associates determined the effect of a particular mineral water on renal function. Of 16 patients with a urea clearance of 50 or more per cent of normal when they used tap water, 12 showed an increased urea clearance after four days of taking the mineral water and 4 showed a definite decrease. Of 9 patients whose urea clearance with tap water was less than 50 per cent of normal, 7 showed an increased and 2 a decreased ability to clear urea after using the mineral water. Twenty-four tests for the total output of phenolsulfonphthalein were done on 21 patients who had less than a 50 per cent output when they used tap water. The use of the mineral water improved the phenolsulfonphthalein excretion in twenty-one, or 87.5 per cent, of the tests. The phenolsulfonphthalein excretion of only 3 patients was lower after the use of the mineral water than it was with tap water. Twelve of fifteen tests on 13 patients who had a phenolsulfonphthalein excretion of more than 50 per cent with tap water showed an increased output when mineral water was used. The apparent effectiveness of the mineral water to improve the renal excretion of certain substances warrants further investigation.

Carotid Sinus Reflex.—Sigler determined the relative frequency of the cardioinhibitory carotid sinus reflex and of abnormalities in the electrocardiogram of 1,073 patients with coronary disease. Observations show that the hyperactive cardioinhibitory carotid sinus reflex occurs more frequently in the disease than do abnormalities in the electrocardiogram. Therefore the test may perhaps be considered of more diagnostic value than the electrocardiogram in recognition of the disease. However, like any other test or method of examination, use of the reflex has its shortcomings and pitfalls. The reflex does occur in disorders other than coronary disease, and it may be absent in coronary disease. It may perhaps be considered a definite sign in coronary disease if it occurs as an independent phenomenon unassociated with other reflexes of the carotid sinus group, such as a definite fall in blood pressure, dizziness, sensory disturbances and syncope, if it occurs as the principal manifestation of the sinus reflex and if it appears after comparatively slight pressure on the carotid sinus region and no other vagal disturbance occurs. Under such circumstances the selective augmentation of the induced vagal impulse is in the cardiac ganglions rather than in the ganglions of vagal centers

in the medulla. If such augmentation occurred in the medullary centers, it would conceivably affect the entire vagal system. Of the 784 men in the series 91.3 per cent and of the 289 women 72.6 per cent showed the cardioinhibitory response, whereas the electrocardiograms of only 63 per cent of the men and 71.9 per cent of the women showed abnormalities. The explanation for the frequency of the hyperactive reflex in coronary disease is at present purely theoretical. It may be due to local cardiac ischemia which lowers the resistance in the vagal ganglions and in the myoneural junctions or which produces some chemical changes that sensitize the vagus nerves locally.

Testosterone Propionate Therapy of Angina Pectoris.

—Lesser reports that 20 men and 4 women from 40 to 77 years of age with an established diagnosis of angina pectoris were treated with testosterone propionate. The drug was administered intramuscularly every second to fifth day in 25 mg doses for a total of five to twenty-five injections, with an average of eleven injections. The frequency, severity and duration of attacks were diminished in all patients, and the patients have been able to increase considerably their physical activity without precipitating an attack. The beneficial effects persisted for two to twelve months after treatment was withdrawn. The improvement in men was much greater than that in women. No improvement followed control injections of sesame oil, although the control patients responded when given testosterone propionate therapy. Untoward effects were not observed. Fluoroscopic examinations, serial kymograms and electrocardiograms revealed no uniform result from the therapy. Testosterone propionate may be a valuable drug in the treatment of angina pectoris, and the results warrant further investigation.

Diethylstilbestrol for Hypo-Ovarianism.—Byrne and his associates state that the addition of vitamin complexes to diethylstilbestrol given to 35 patients with physiologic ovarian failure and to 12 with ovarian deficiency resulting from surgical procedures did not minimize the incidence of nausea occasioned by diethylstilbestrol alone.

Weil's Disease.—Wilen and his co-workers point out that during August and September 1941 a diagnosis of Weil's disease was made on 4 male patients at the Charity Hospital. All 4 patients had chills, a sudden onset with fever, prostration, muscular aching pains, jaundice and leukocytosis with a white cell count not exceeding 15,000. An interesting feature in the history of 2 of the patients was the fact that they were neighbors and that there were jaundiced cattle in the immediate vicinity of their homes. The serum of one of these cows failed to agglutinate *Leptospira icterohemorrhagiae* and *Leptospira canicola*, and inoculations into guinea pigs with blood from this

cow proved negative. However, the owner of the cow and one of his employees gave a history of a recent severe illness of ten days with a sudden onset associated with fever, prostration, smoky urine and questionable jaundice. Laboratory studies were negative for *Leptospira icterohemorrhagiae*.

Dissemination of Tubercle Bacilli from Fresh Necropsy Material.—In trying to determine the validity of the statement that fresh necropsy material is relatively innocuous as a contaminant of air, Sloan made a glass-enclosed elevating shield and placed it 8 inches (20 cm.) above the pulmonary specimens to be examined from 10 patients who had died from tuberculosis. Necessary precautions were taken before and during the examination so that all drafts from fans and open windows were eliminated. He observed that necropsy methods which make use of a compression technic contaminate the atmosphere in the immediate vicinity. Within the limitations of his study, fresh tuberculous lungs are definitely dangerous and are a potent source of atmospheric contamination. Proper methods of protection should be devised.

Virus Pneumonia.—Moss reports 3 cases of probable "virus pneumonia." The onset was characterized by a harassing, at times paroxysmal, cough, which was nonproductive or productive of only a small amount of mucopurulent sputum. There was no pleurisy. Bacteriologic studies failed to demonstrate the etiologic organism. Repeated leukocyte counts were normal or only slightly elevated. The temperature was rather high during the first few days of the disease, and there was a relative bradycardia until the temperature fell by lysis on the fifth to the seventh day. Two of the 3 patients showed no physical sign of pneumonia until the lesion was revealed in a roentgenogram. Physical signs, when present, were those of incomplete consolidation. The disease was refractory to sulfonamide therapy. Although deaths from "virus pneumonia" have been reported, the disease is relatively benign. It is highly communicable (the author's patients comprised the original patient and his two nurses).

Sulfanilic Acid Derivatives for Trachoma.—Cosgrove and Hundley state that 1,866 patients from the Arkansas Trachoma Service have been given various sulfanilic acid derivatives. The trachoma of 402 (21.5 per cent) was improved, that of 1,359 (73 per cent) was arrested and that of 105 (5.5 per cent) was not improved. The visual impairment of 74.7 per cent of the patients was arrested, that of 19.9 per cent was improved and that of 5.4 per cent was not improved. The improvement in vision has been from 5 to 80 per cent. As 8.7 per cent of the patients have complications which require surgical intervention and 3.5 per cent have been observed for less than three months, the total in which trachoma can be arrested is near 90 per cent. The results show that a sufficient dose of any one of the sulfonamides is equally effective. An average of 1.85 mg. per hundred cubic centimeters of free sulfanilamide in the blood is required to arrest trachoma. Oral administration, supplemented by local application, permits the use of smaller doses. Ambulatory treatment is possible, and there is no danger of serious reactions.

Neonatal Erythroblastosis.—Javert separates neonatal erythroblastosis into hydropic, icteric, anemic, hemorrhagic and unclassified types. In his series of cases the total incidence of erythroblastosis was 1.438 and the fetal mortality caused by the disease was 3.2 per cent. Of the mothers 92 per cent were

multiparous. A high incidence of preeclamptic toxemia existed among the mothers of hydropic and icteric infants. Excessive uterine enlargement was due to the weight of the infant and the placenta and not to the hydramnios. The hydropic infants were born a month or more prematurely, whereas the icteric infants were born nearer term. Asphyxia within the uterus, after birth or during neonatal life was a prominent symptom of the fetus. Therefore, if erythroblastosis is suspected all prepartum analgesia and anesthesia is interdicted. Local infiltration can be used for an episiotomy. The incidence of postpartum hemorrhage was increased, particularly among mothers of hydropic infants. The incidence of operative delivery because of fetal distress was 56 per cent. The patient's obstetric history should replace the "family history," as the disease is not strictly familial. Parity is important, as the incidence of erythroblastosis after its initial appearance is approximately 50 per cent. If the first born had the disease, the subsequent incidence is nearly 100 per cent. Studies of the maternal blood usually gave normal results except for an increased icteric index and uric acid. The serum proteins were generally reduced. Several of the mothers were Rh negative. The infants had a high incidence of congenital anomalies. The increased number and ratio of the erythroblasts and the normoblasts in the cord blood are important diagnostic criteria. The immediate treatment of erythroblastosis is to combat asphyxia. The mortality for the hydropic infants was 100 per cent, for the icteric 54 per cent. The Buddha-like habitus of the fetus in utero seen on roentgen study is an important diagnostic feature. Paternal studies revealed that the fathers were Rh positive. The probable pathogenesis of erythroblastosis is hepatic dysfunction. Erythroblastosis runs part of its course in utero, and the obstetrician and the pediatrician are in a strategic position for antepartum diagnosis.

Antihemorrhagic Effects of Vitamin K-like Substance.

—Davison and his co-workers discuss their experience with the new water soluble vitamin K-like preparation the tetra sodium salt of 2-methyl-1, 4-naphthohydroquinone diphosphoric acid ester, or preparation N-123, in 41 patients. Most of the patients had disease of the biliary tract or the liver associated with jaundice, and a few had gastrointestinal disturbances or severe sepsis conducive to vitamin K deficiency. The prothrombin level of the blood was determined, and a daily dose of 10 mg. of the preparation was given for six days. The blood prothrombin levels were determined daily for eight days, and on the seventh and eighth days after treatment was begun the clotting time was also determined. The prothrombin level of most of the patients rose to normal limits within twenty-four to forty-eight hours after the initial dose of the preparation. After a 100 per cent level was reached it could be maintained for forty-eight to seventy-two hours without further medication unless there were fluctuations during medication. The level fluctuated when existing jaundice was aggravated or when a high fever, profuse vomiting or anorexia appeared suddenly. The rise of the prothrombin level was retarded in patients with pyloric obstruction, hepatic damage and severe sepsis and after colostomy. Patients with K avitaminosis from uncomplicated obstructive jaundice responded promptly to the daily administration of 10 mg. of preparation N-123. Patients with hepatic damage interfering with vitamin K storage and utilization and those with sepsis and pathologic changes in the gastrointestinal tract responded less promptly, less completely and for a shorter period.

Injury to Lung from Detonation of High Explosive.

—King and Curtis describe the effects on the body of the detonation of a high explosive, particularly on the pulmonary system, and compare them with those observed in civilian life in peace time. Explosives are of two types: low and high. Low explosives have explosion velocities of a few thousand or less feet per second in contrast to high explosives, which have velocities of 5,000 to 25,000 feet. At every point in the immediate neighborhood the detonation of a high explosive sets up a momentary wave of high pressure and then a negative "suction" pressure, owing to the fact that the positive compression wave reduces the density of the air behind it to below normal atmospheric pressure. The wave of pressure is highest in the immediate region of the explosion and falls off rapidly as it moves away. The prime characteristic of a detonation is that whereas

the disturbance moves forward the objects through which it travels do not move with it but oscillate backward and forward. Thus the violence of a blast can bruise the walls of the lung as if they had been struck by a solid object. The pulmonary damage from the detonation of a high explosive is characterized by alveolar rupture and hemorrhage. Examination of persons killed by explosion (without obvious external injury) may reveal a tear of the lung or a bulbar hemorrhage, or in those who live for a time the meningeal vessels may be ruptured and the viscera may be lacerated. The results of experimental studies confirm the clinical and postmortem observations that pulmonary lesions predominate and substantiate the view that the lesions are due to the impact on the thoracic wall of the pressure component of the blast wave. Lesions of the central nervous system also may be produced by a blast. The mechanism responsible for the cerebral lesions has been explained as due to the hydraulic-like pressure that develops from the sudden compression of the thoracic cage and the consequent violent back pressure on the venous side. The pulmonary injury may be prevented by the use of air raid shelters, ditches, holes and gutters, by just lying flat on the ground in the prone position (the back of the thorax yields less to injury than the front part) or by covering the chest with sponge rubber or some similar material. The early recognition of the injury is of prime therapeutic importance. Complete rest is imperative, and judging from the condition of the lungs at necropsy and clinically from the embarrassed breathing every effort should be made to avoid any additional trauma to the lungs. Oxygen therapy may be worthy of more extensive use. The awareness that such damage may occur should stimulate all physicians to look for it among air raid casualties.

Myeloscropy.—Pool states that since the principle of intraspinal endoscopy, adapted to the diagnosis of lesions affecting the cauda equina and the lowermost portion of the spinal cord, was suggested four years ago nearly 400 "myeloscopic" examinations have been done. The instrument devised for the purpose may be introduced between lumbar spinous processes in much the same manner as a lumbar puncture needle. Trauma to nerve roots has not ensued. The conditions to be recognized by myeloscropy are varicose vessels, arachnoid adhesions of post-traumatic or postinflammatory origin, neoplasms, inflamed nerve roots associated with neuritis and herniated nucleus pulposus or hypertrophied ligamentum flavum. Despite the loss of 5 to 15 cc. of cerebrospinal fluid during myeloscropy, the incidence of postpuncture headache has not been any greater than that which follows a lumbar puncture. The explanation for this may be that the procedure is carried out with the patient in the upright position so that intracranial dynamics accommodate themselves as the spinal fluid flows out. Myeloscropy has revealed large collections of epidural fluid two

four days after lumbar puncture, demonstrating that spinal fluid can continue to leak for some time after a lumbar tap. Therefore, myelography should be delayed for at least five days after a lumbar puncture has been done; otherwise the procedure may be difficult, as the hydrostatic tension of the dural and arachnoid membranes will have been lost as a result of the leak. Myelography has not yet been performed over the spinal cord, although it was done successfully within the cisterna magna of an anesthetized dog. The myeloscope has been used for intra-ventricular visualization through trephine openings in the human skull, and attempts are now in progress to study action currents from the nerve roots of the cauda equina. Myelography will aid in the differential diagnosis of operable and inoperable lesions of the cauda equina and the lower portion of the spinal cord. It may often rule out post-traumatic malingering. The necessity of injection of iodized oil and exploratory laminectomy may be obviated by preliminary myelography. Inoperable conditions depicted by myelography are various types of varicose veins of the cauda equina, arteriosclerosis of the spinal cord and metastatic neoplasms.

Hemangioma of Liver.—Shumacker encountered a large hepatic hemangioma during a laparotomy which required the decision whether it was the cause of the patient's symptoms and whether resection would relieve the distress. He reviews 66 similar cases reported in the literature. The tumor of 56 of the 67 patients was resected. The youngest patient was 6 years old and the oldest 76. Fifty-one of 62 patients on whom data are available were females. The initial complaint of the patients was of a mass in the epigastrium or of some equivalent symptom. Other complaints were weakness, evening fever, slight local discomfort, a sense of weight, fullness or pressure in the upper part of the abdomen, dysmenorrhea, dysuria, pain in the back of the legs and severe or mild epigastric pain. Nausea, vomiting and anorexia were common. In 3 in whom the hemangioma ruptured, the illness was of short duration and suggested acute appendicitis, ruptured tubal pregnancy or peritonitis. In most of the others the complaints were chronic, beginning in some instances ten or twenty years before operation. The average duration of symptoms was nearly five years. In 54 an epigastric tumor was palpable at the time of operation. The symptoms of only 7 suggested disease of the gallbladder or of the biliary tract. On palpation nothing characteristic was observed about the tumor. The correct preoperative diagnosis was made on only 2 patients. Only 1 of the 56 patients operated on died. Various procedures were employed. Adequate mobilization of the liver, through division of the ligamentous attachment to the diaphragm and temporary compression of the hilar structures, is helpful in controlling bleeding. The tumor should never be cut into nor should it be aspirated. The real danger associated with hemangioma of the liver is rupture of the tumor. In bleeding from a hemangioma better results may be expected from resection than from packing. There were 5 deaths among the 11 patients whose tumor was not removed. Contributing factors were spontaneous rupture of the tumor before, during or after operation or bleeding from tapping or incising the tumor at operation. Two patients were treated successfully with the roentgen ray; 1 had an inoperable tumor of the right lobe and the other a tumor in the right lobe several months after a hemangioma of the left lobe had been resected. In general, most of the patients were relieved of their complaints after the tumor had been resected.

Exudative Interstitial Nephritis.—Bell states that in subjects seen at necropsy the obstructive form of pyelonephritis is about twelve times as frequent as the nonobstructive type. The age and sex distribution corresponds with that observed in hydronephrosis. The symptoms are usually overshadowed by those of hydronephrosis. Renal infection is present at necropsy about twice as often (61 to 83 per cent) in obstruction of the lower portion of the urinary tract as in ureteral obstruction above the bladder (23 to 46 per cent). The incidence of chronic hypertension in hydronephrosis is not greater than that in a control population of corresponding age. Cortical abscesses are frequently seen post mortem, but only 40 typical instances of acute nonobstructive pyelonephritis were observed among more

than 32,000 necropsies. Only 14 examples of chronic bilateral nonobstructive pyelonephritis were encountered. The available evidence indicates that this disease seldom causes chronic hypertension. The blood pressure of 5 patients has been reported to remain normal for more than one year after a unilateral nephrectomy for chronic atrophic pyelonephritis. Therefore there may be some other explanation for the success of the treatment in these cases, since many failures have been observed. In unilateral renal ischemia produced by Goldblatt's method the blood pressure returns to normal if the ischemic kidney becomes severely atrophic. The thick walled arteries in atrophic pyelonephritis represent disuse atrophy and not primary vascular disease.

Formation and Use of Plasma.—Semoff believes that a practical and simple method of preparing and storing blood plasma in a small hospital or clinic is the Baxter vacuum technic. A series of 500 cc. flasks, containing the proper diluents and a partial vacuum, a machined valve, needles and a donor are all that is needed. The entire system is a closed one, safeguarded by rubber vacuum seals. Merthiolate is added as an extra precaution. A further technic for diluted plasma makes use of a 1,000 cc. flask which contains 500 cc. of an anticoagulating diluent. The initial donors will have to be volunteers, but thereafter blood should be replaced as it is drawn. Diluted stored plasma will answer almost all needs. However, for increased intracranial pressure undiluted plasma is best. The cost, discounting labor, is about one-tenth that of commercial human plasma. The small hospital or clinic with no added personnel can easily prepare its own plasma for its needs.

Present Treatment of War Wounds.—Gordon-Taylor states that wounds caused by bomb fragments are produced not only by metal but by glass splinters, fragments of wood, pieces of stone and debris. The rarity with which gas gangrene has been encountered in this war is in striking contrast to its frequency during World War I. The débridement practiced now is not more thorough than it was then. The use of the sulfonamide derivatives and of plaster casts to insure complete rest is probably the important factor. Antigangrene serum is administered not in a routine manner but only to persons with severe wounds especially susceptible to gas infection, such as wounds of the buttocks, the perineum and the calf muscles. Secondary hemorrhages constitute a serious problem, but in the author's experience they were rare. Tetanus was extremely rare because of immunization. Burns have been a frequent lesion during this war. Treatment by coagulation is indicated for extensive burns of the body; it is definitely contraindicated for burns of the hands and the face. For the latter saline dressings, sulfonamide derivatives and tulle gras are most frequently used. Lesions caused by mines, which involve chiefly the lower extremities, are frequent in the navy. The calcaneum

is particularly vulnerable. All bones of the lower leg may be fractured, and dislocation of the knee is not rare. Compression fracture of the first lumbar vertebra is encountered after mine explosions; every patient who complains of a pain in the back should be subjected to roentgenoscopy. Abdominal injury is particularly likely to be produced by small fragments of bombs. The value of abundant transfusions of blood or its derivatives in grave shock has been demonstrated. Blast injury of the lung is characterized by expectoration and by distention of the lower part of the thorax. The typical abdominal lesions of blast are retroperitoneal hematoma, perirenal extravasation and intermesenteric encircling of the intestinal wall. MacWilliams called attention to "blast by immersion." It is observed in shipwrecked persons exposed to detonations in the surrounding water and may result in rupture of the small intestine, of the cecum or of the ascending colon. Some patients with lesions of this type have been known to survive after operation.

Duodenal Achalasia.—Cantero and Jutras classify duodenal dyskinesias as mechanical and functional. The term achalasia was first applied by Hurst to the deficient relaxation of the sphincters. Two groups of symptoms may be present: those caused by stasis and those resulting from autointoxication. Stasis and dilatation manifest themselves in a sense of fullness and of epigastric distention during or shortly after a meal. The distention may develop into a severe pain and may be followed by vomiting, prostration and headache. Among the consequences of duodenal autointoxication, attacks of migraine take the first place. They may cause the patient to abstain from food, with resulting emaciation and weakness. The malnutrition reacts on the mental state. Although anxiety, emotional stress, prolonged chagrin and intellectual overwork often elicit the syndrome, the psychic effects of malnutrition likewise influence the character. The incidence of duodenal stasis is comparatively high. Although the authors detected duodenal achalasia in children 9 and 11 years of age the disorder is rare in children. It is frequent in the aged and the middle aged and is somewhat more frequent in women than in men. It progresses in bouts that last from several weeks to several months, in the course of which the subject becomes pale or yellowish and loses weight, strength and control of the nerves. The resulting reduction in resistance involves the threat of intercurrent infections. Surgical treatment rarely produces satisfactory results. Medical treatment, if carried out faithfully, is, as a rule, effective. It includes provision for a diet rich in proteins, carbohydrates, mineral salts and vitamins, mental and physical relaxation such as may be obtained by life in the open air, drainage and lavage of the duodenum repeated two or three times a week for several months, and medication to establish vagosympathetic equilibrium, especially with acetylcholine and prostigmine.

Meningococcic Meningitis.—Dingle and Finland review the present status of the prevention, diagnosis and treatment of acute bacterial meningitis. Epidemics which occurred during the last world war are prevalent in some countries today and may in the near future become widespread in the armed forces

or the civilian population of this country. Every patient with meningitis represents an individual problem and should be in the hands of one physician during the entire course of his illness. The diagnostic aids and procedures are the clinical history, physical examination, blood culture, hematologic examination, cultures of miscellaneous material, the determination of the nonprotein nitrogen of the blood, urinalysis and lumbar puncture performed as soon as possible under strict surgical asepsis, determination of the initial pressure, determination of the dynamics of the cerebrospinal fluid, chemical analysis of the cerebrospinal fluid and the blood, cytologic study and bacteriologic isolation. The treatment of meningococcic meningitis consists in the institution of chemotherapy immediately after the presence of organisms is known, the correction of dehydration by administering isotonic solution of sodium chloride with or without dextrose, specific serum therapy to supplement chemotherapy, the treatment of focal infections, the utilization of laboratory aids (determination of the level in the blood and cerebrospinal fluid of the drug administered, the hemoglobin concentration, blood counts and cultures) for the control, change or withdrawal of therapy and symptomatic and supportive treatment. The convalescent period should be about one month after complete recovery and longer if the illness was severe and protracted. In the management of a patient with a relapse or a recurrence the differential diagnosis should include a concomitant infection, infection at another focus caused by the original organism, drug fever and serum sickness. A lumbar puncture, with complete examination of the cerebrospinal fluid as after the initial puncture, should be performed, the total and differential erythrocyte counts should be repeated and treatment as for an initial infection should be resumed if indicated.

Experimental Gas Gangrene.—Reed and Orr controlled experimental gas gangrene in guinea pigs after inoculating them with ten times the minimal lethal dose of *Clostridium welchii*, *Clostridium septicum*, *Clostridium novyi* or *Clostridium sordelli* or with a mixture of one or more of these and *Clostridium sporogenes* or *Clostridium histolyticum* by local therapy with one of the sulfonamide derivatives. Infection caused by *Cl. welchii* responded most readily to chemotherapy. Infections caused by *Cl. septicum* and *Cl. novyi* were somewhat more resistant, and those caused by *Cl. sordelli* were definitely resistant to chemotherapy. In the order of increasing effectiveness the drugs tested were sulfanilamide, sulfacetamide, sulfaguanidine, sulfapyridine, sulfamethylthiazole, sulfadiazine and sulfathiazole. The superiority of local to oral treatment is more definite with the less efficient than with the more efficient drugs.

Zinc Peroxide for Experimental Gas Gangrene.—Reed and Orr observed that the introduction of zinc peroxide into wounds of guinea pigs into which ten fatal doses of *Clostridium welchii*, *Clostridium septicum*, *Clostridium novyi* or *Clostridium sordelli* previously had been injected resulted in a high percentage of recoveries and a prolongation of the survival time among guinea pigs with a fatal infection. Zinc peroxide was slightly less effective than sulfathiazole in the treatment of wounds in which gas gangrene infection had become established before therapy was instituted.

Prevention of Gas Gangrene.—Stewart outlines a method for concentrating *Clostridium perfringens* toxoid which she has successfully used in the prophylaxis of gas gangrene. Her evidence is based on the results obtained with 54 guinea pigs given injections of the toxoid. The serum of only 7 of them showed 0.25 unit of antitoxin or more per cubic centimeter. One month after the last injection of toxoid each guinea pig was inoculated intraperitoneally with one to four minimal lethal doses of a *Cl. perfringens* culture. None of the animals survived except those which showed antitoxin in the serum by mouse titration. When ten to thirty minimal lethal doses of culture were injected intramuscularly into an immunized guinea pig only a localized infection frequently resulted. The low antigenicity of the toxoid may be due to a loss of some antigenic factor during filtration. Since the lethal toxin can be concentrated many times by this process, it may be that other factors are necessary to produce a good antigen and that these are lost in filtration.

*Familial Renal Dwarfism. S. Graham and J. H. Hutchinson.—p. 253.

Familial Renal Dwarfism.—Graham and Hutchinson report 3 and probably 4 instances of renal dwarfism that occurred among 8 live-born children. Both parents are healthy. A history of renal disease on either side of the family was not present. The 4 instances occurred in successive pregnancies in the middle of the mother's childbearing life. No information is available with regard to the underlying pathologic changes, as permission for postmortem was not granted for the 2 patients seen by the authors, the third patient died some time before and the fourth patient is apparently well but still small. As usual, hypertension was not present nor were casts found in the urine. Because of these features it has been suggested that renal dwarfism is more often due to congenital hypoplasia of the kidneys than to chronic nephritis. Coplin has suggested that the renal hypoplasia might be due to defective arteriogenesis with a consequent defective development and a scarcity of secretory units. Such an inherent fault in the germ plasma might explain the familial incidence.

Experiments with Renin. R. W. Scarff and N. H. Martin.—p. 309.

Influenza B in Southern England.—Lush and her associates tested against influenza B virus all the serums available from the 1939 epidemic of influenza in England, including serums known to have shown a rise in titer against influenza A virus. The rise in titer in the 8 serums positive to the B strain of the virus was respectively 600, 150, 150, 100, 50, 40, 20 and 10 fold. Influenza caused by the B virus was widespread not only during the early part of 1939 but throughout the whole epidemic period. It occurred in two of the institutions investigated at the same time as an outbreak of influenza A, and clinically it was not distinguishable from virus A infection. No serum showed an antibody rise against both the A and the B virus. The serum of about half of the patients showed no rise in antibody against either virus, and consequently the authors assume that in these patients the disease was due to an as yet unknown agent.

Wounding Mechanism of High Velocity Missiles.—According to the investigation carried out by Black and his colleagues on rabbits and on blocks of 20 and 5 per cent gelatin into which a cordite charge (a $\frac{3}{32}$ inch steel ball weighing 53 mg.) was fired at velocities varying from 500 to 5,000 feet per second, it appears that the disproportionate degree of

tissue destruction caused by small high velocity bomb splinters is due to the fact that particles lying in their path are thrown radially with sufficient violence to leave a central cavity around which tissues at some distance from the track are momentarily stretched. While blood vessels are usually elastic enough to experience this strain without anatomic and functional injury and nerves without obvious anatomic injury, bones are often broken at some distance from the track.

Pfeiffer's Bacillus (Influenzal) Meningitis.—Mutch states that influenzal meningitis due to Pfeiffer's bacillus, which is comparatively uncommon in England, has been observed in 3 patients and probably in 2 others since August 1941. England's comparative immunity, the author suggests, may be due to a higher individual resistance to Pfeiffer's bacillus acquired in the land of the common cold. In America the bacilli are described as being numerous. In the author's patients the bacilli were so few that they might easily have escaped notice. The disease may possibly be overlooked sometimes when laboratory facilities are inadequate. The organism often is not seen or fails to grow from cerebrospinal fluid from patients with suppurative meningitis. There is a tendency to ascribe this failure to death of the bacteria during transport of the specimen or to administration of sulfonamide derivatives before the fluid is collected, but it is conceivable that the group of cases in which culture is unsatisfactory may include a proportion of cases of influenza.

Dust Laying Oils for Bedclothes.—The possible importance in preventing the spread of infection and the relative simplicity of treating bedclothes with liquid petrolatum have caused van den Ende and Thomas to find substitutes for liquid petrolatum, which in the quantity necessary is expensive, and to simplify the method of application. The shortage of paraffinum liquidum British Pharmacopoeia has led to the introduction of paraffinum liquidum leve British Pharmacopoeia. This is a highly refined, inert petrolatum oil with a lower density and viscosity than the original oil and represents the most refined type of what are known technically as white oils. These white oils are available in considerable quantities, and the authors have used one which differs from the new British Pharmacopoeia product only in that it has a higher acid value. Unlike refined yellow spindle oils, the white oils are not carcinogenic. All

the white oils tested have proved to be efficient dust layers. The fact that these oils, with the aid of suitable wetting and emulsifying agents, result in centrifuge stable emulsions with water overcomes the original difficulty of applying an organic solvent and makes mass treatment of bedclothes a practical possibility in hospital laundries. Furthermore, the emulsifiers used are bactericidal under natural conditions, especially against wet organisms, as those in moist droplets. Bedclothes are thoroughly soaked in a 20 per cent water solution of the oil, spun in a hydroextractor and then dried in the hot air drying chamber. Bedclothes treated with the soluble oils not only retain most of the organisms within the actual fabric but also kill the organisms in droplets before they dry. The use of the soluble oils in hospital trials resulted in a 99 per cent reduction in the number of organisms liberated during bed making.

Chronic Alcoholism and Suicide: Bandel's Theory of Influence of Alcoholism on Incidence of Suicide. Z. Shimshony.—p. 1429.

Suction Drainage of Pulmonary Cavities.—Schubert suggests that immunobiologic states and mechanical factors play a part in the varying healing tendencies of tuberculous cavities. The cavernous wall and its surroundings, the air pressure inside the cavity and the behavior of the draining bronchus are important mechanical factors. The production of a continued negative pressure in the tuberculous cavity, such as is produced by Monaldi's suction drainage, promotes its shrinkage. By removing the toxic contents, suction drainage also cleanses the cavernous walls. As a result coughing decreases, bacilli disappear from the sputum and the cavity, the toxicity diminishes and the general condition improves. Among the indications for Monaldi's suction drainage the author stresses that there must not exist a free pleural space corresponding to the region of the cavity. The presence of even a small pleural space results in the formation of empyema. It is therefore essential to make careful attempts at pneumothorax, and only after adhesion is absolutely certain can suction treatment be started. If the pleural space is only partially free, an attempt can be made to obliterate it by the introduction of talcum. The author found this procedure helpful in a number of cases as a preparation for suction drainage. A fairly good immunobiologic equilibrium is also desirable. Fever bouts should have subsided. It may be desirable first to subject the patient to sanatorium treatment. Experience has demonstrated that the danger of complications is comparatively slight. The author employed the treatment in 56 cases. The time elapsed is too

short to permit evaluation of the permanent results. Suction drainage is a valuable addition to the treatment of tuberculous cavities. When it alone does not produce a permanent cure, it puts the patient into a better condition for a subsequent thoracoplasty. Suction drainage makes thoracoplasty possible in some cases in which it would otherwise have been impossible.

- *Value of Artificial Estrogens in Gynecologic Disease. N. Arenas.—p. 441.

Synthetic Estrogens in Gynecologic Disease.—Dichylstilbestrol, according to Arenas, produces estrus in spayed animals and proliferation of the endometrium, enlargement of the breasts and similar phenomena in menopausal or castrated women. The drug is twice as strong as natural estrogens. It can be administered by mouth and is less expensive than the natural estrogens. It should be taken in milk to prevent gastric symptoms. The author obtained satisfactory results in a large number of patients with menopausal symptoms, hypogonadism, vulvar pruritus and cessation of milk secretion and in young girls and old women with vaginitis. The daily dose varied from 1 to 2 mg. of the substance up to a total of 80 mg. It is advisable to stop the treatment when symptoms are almost under control and either to repeat after a moderate period of rest or to administer the substance in smaller doses and at longer intervals.

*Seven Years' Experience with Diabetes Mellitus in Children. Maria Luisa Saldún de Rodríguez.—p. 796.
Nicolas-Favre's Disease in Child of Eighteen Months. V. Pereira and J. V. Gil.—p. 812.

Diabetes in Children.—Saldún de Rodríguez reports observations lasting seven years on 57 children with diabetes mellitus. The course of diabetes in the child is determined by two groups of factors: (1) physiologic factors involving growth, development, glycemic instability and the glands of internal secretion and (2) treatment, which is concerned with diet, the use of insulin, adjuvant medication, hygienic care and social protection. The dietetic treatment is fundamental. The most effective diet is one which is rich in carbohydrates and in which the ratio of antiketogenic to ketogenic substances is kept at 2 or more. The quantity of proteins and the caloric value should correspond to the requisites for healthy children. The menu should be individualized and as far as possible adjusted to the taste of the child and to the economic status of the family. Insulin therapy is indispensable for the child; without it the course of the disease will always be unfavorable. At first insulin should be given in a quantity sufficient to metabolize all the diet and to maintain a humoral equilibrium. Later, in cases of evident improvement, the amount can be gradually diminished and some of the injections omitted, but the humoral equilibrium must always be maintained. The author employed ordinary insulin because it is easier to manage and does not produce nocturnal hypoglycemia. Liver therapy produced favorable results in hepatomegaly and in nocturnal hyperglycemia; ovarian, testicular and hypophyseal therapy are useful in the prepuberal period. Therapy with vitamins B₁ and D and calcium was employed. Social protection is an important factor; it comprises instruction of the family, prevention of the development of an inferiority complex and collaboration with the teacher and the visiting nurse. If correct treatment is given, clinical normalization of the secretory equilibrium, of the metabolism and of physical and intellectual growth can usually be obtained in the diabetic child. Disturbances in the sexual sphere, such as delayed puberty or menstrual disturbances, are comparatively frequent but can be ameliorated or corrected by endocrine therapy. It is much more difficult to establish a humoral equilibrium in a child in whom it has been neglected for a long time than in a child who has been correctly treated from the beginning.

*Therapy of Chronic Arterial Hypertension by Large Doses of Vitamin A. J. Govea Peña and M. Villaverde.—p. 332.

Vitamin A in Chronic Arterial Hypertension.—Govea Peña and Villaverde administered vitamin A to 65 patients with chronic hypertension. Administration of 180,000 units of vitamin A for several days resulted in lowering of the blood pressure 30 to 40 mm. of mercury. After this 90,000 units was given daily for several months. Lowering of the blood pressure frequently took place during the first forty-eight hours. In all cases, symptoms of hypertension diminished early in the course of the treatment. Headache generally disappeared within the first forty-eight hours. The symptomatic and functional improvement continued long after the treatment had been discontinued. None of the 65 patients were treated by any special rest different from that which they had in the course of previous treatments, which had failed. The only 4 whose treatment was a failure had malignant arterial hypertension. Vitamin A given in large doses has a considerable hypotensive effect. The vitamin is best administered by mouth; intramuscular injections give rise to inflammation in about 90 per cent of cases.

*Artificial Active Immunization Against Typhoid and Paratyphoid A and B with Only One Dose of Typhoid and A and B Paratyphoid Vaccines Precipitated with Alum. A. P. León, F. Escarza and E. Rabasa.—p. 161.

Active Immunization Against Typhoid and Paratyphoid A and B.—León and his colleagues found that alum has a bactericidal effect on salmonellas of the typhoid and paratyphoid groups and precipitates them; a given dose of precipitated typhoid or paratyphoid bacteria immunizes animals with greater immunity than that which is produced by three times the same dose of nonprecipitated bacteria. They prepared a vaccine with typhoid and A and B paratyphoid bacteria which was precipitated with alum. The vaccine was administered to several hundred persons in one dose of 1 cc. containing 1,000 million typhoid bacteria and 500 million each of paratyphoid A and B bacteria. The O, H and Vi agglutinins and protecting antibodies were determined in the blood serum before and after vaccination by the mouse protection test. A single dose of the alum precipitated vaccines gave immunity as high or higher than that produced by three doses of the standard vaccines. The local and general reactions caused by the alum precipitated vaccine are almost equal to those caused by one of the three doses of the standard vaccine and are not considered a contraindication to its use in individual or mass immunization.

*Influence of Surgical Trauma on Venous Blood Pressure. P. Ollinger.—p. 628.

Solitary Xanthoma of Bone.—According to Puhl, localized xanthoma of bone occurs in solid or cystic form, and in its clinical behavior and microscopic appearance it greatly resembles giant cell tumor or genuine bone cyst, which are dysontogenic mesenchymal blastomas. The difference consists merely in the yellow discoloration of the tissue or the cholesterol content of the cyst produced by a lipid modification of the mesenchymal tumor cell. The appearance of lipophagic granuloma, the inflammatory component of which can be intensified by necrosis, develops only after disintegration of the xanthoma cells and precipitation of crystalline cholesterol, as the result of foreign body irritation of the still functioning mesenchymal cells. Xanthoma of bone thus is a giant cell tumor or a bone

cyst the mesenchymal cells of which have undergone secondary lipid changes, such as occur also in other tumors. For this reason bone xanthoma is best identified by the term "solid or cystic xanthomatous mesenchymal blastoma." There is no primary disturbance in the lipid metabolism, although slight hypercholesteremia may have been demonstrated in a few cases; the tumor formation is independent of such a disturbance. The lipid storage of the mesenchymal tumor cell develops neither from an increased supply nor from absorption from decaying foci. Stasis of lymph likewise cannot be demonstrated. Xanthoma is apparently the result of an actively increased cellular function comparable to the lipid and particularly the cholesterol metabolism. The giant cell tumors and ganglions of the tendon sheaths are mesenchymal blastomas. Their genesis corresponds to the corresponding neoplasms in bone. These tumors likewise frequently show a lipid modification of the mesenchymal cells. Thus the embryonal mesenchymal cell is the vehicle of the lipid modification in all these tumors. Localized xanthoma of bone is a benign tumor as far as its histologic character corresponds to that of giant cell tumor or bone cyst. However, a malignant tumor may be masked by similar roentgenologic and macroscopic appearances. A differentiation from the systematic and generalized lipidoses seems necessary, but the occurrence of polystotic forms must be considered.

Struma Suprarenalis Cystica Hemorrhagica.—According to Schröder, Henschen applied the term struma suprarenalis cystica hemorrhagica in 1906 to blood cysts of the adrenal glands. The literature contains records of only 20 cases of this condition. The cyst originates from an adrenal gland or an adrenal tumor and develops gradually, as a rule in the course of decades and as the result of successive hemorrhages into the cystic cavity. Generally the cyst causes difficulties and is discovered only after it has become so large that it interferes with neighboring organs (kidney, spleen, liver, large intestine). Frequently an internal epithelial lining is absent. Adrenal tissue can be demonstrated in the cystic wall or adhering to it; this corroborates the diagnosis. The author reports the successful extirpation of an adrenal blood cyst of 3.75 liters capacity from a woman aged 61. The flank incision of Küttner with combined retroperitoneal and intraperitoneal maneuvers proved advantageous in the removal of the cyst. Marsupialization of the cyst should be resorted to only in an emergency.

Influence of Surgical Trauma on Venous Blood Pressure.—Ollinger investigated the effect of the anesthetic and of surgical trauma on the venous pressure during the postoperative period. The pressure was determined by the Moritz and von Tabora method. In all, two hundred and seventy-four determinations were made on 78 patients, the pressure being determined once before the operation and from two to six times afterward. In two thirds of the patients the venous pressure fell immediately after the operation, but in the other third it rose. The fall was greatest in patients undergoing gastric resection and the rise in those undergoing strumectomy. The extent and persistence of fluctuations in venous pressure generally show some relationship to the extent and nature of the intervention and to the type of anesthesia. The postoperative venous pressure reaction is greater when general anesthesia is used. Trauma caused by general anesthesia is at first considerable but is less persistent than that caused by surgical intervention. Slight upward or downward fluctuations are of no particular prognostic significance. Considerable fluctuations indicate substantial circulatory impairment, particularly if the arterial pressure decreases at the same time. If several days after the operation the venous pressure shows no tendency to return to the initial figure, the circulation is threatened even in the absence of considerable fluctuations in the arterial pressure. The behavior of the venous pressure early indicates possible circulatory and respiratory complications and thus gives hints as to the treatment to be employed. Impairment of the respiratory function may likewise play a part in the development of postoperative fluctuations in the venous pressure. Fluctuations in venous pressure suggest that the postoperative condition is nearly always a collapse for which the term "shock" is not suitable.

Book Notices

The Furtherance of Medical Research. By Alan Gregg, M.D., Director for the Medical Sciences at the Rockefeller Foundation, New York. Cloth. Price, \$2. Pp. 129. New Haven: Yale University Press; London: Oxford University Press, 1941.

This is the eighteenth in the series of the Terry Lectures. It records the development and importance of modern medical research. Gregg emphasizes the importance of selecting the proper persons for research. The investigator should be in a university environment where he is at least tolerated if not appreciated and where he has easy and informal access to the minds of colleagues, where he may have the opportunity to develop disciples and to sharpen his mind. The medical scientist needs association and assistance from a wide range of sciences. "Medical research bears obviously close relation to research of many kinds. As the physiology of today may become the clinical knowledge of tomorrow, so the discoveries of physics and chemistry of today may become an intimate element in the physiology of tomorrow." This should convey to the student who plans to enter medicine the importance of the preclinical sciences, the significance of which seems to elude the grasp of many who are attempting to teach them.

The requirements of state boards of licensure are not synonymous with those of an adequate training for medical research. The author contrasts the practitioner of medicine and the investigator in the words of Sir Thomas Lewis: "Self confidence is by general consent one of the essentials to the practice of medicine, for it breeds confidence, faith and hope. Diffidence, by equally general consent, is an essential quality in investigation, for it breeds inquiry. . . . A natural companion of confidence is an easy and uncritical acceptance of statements of fact and of hypothesis; it is often coupled with a very wide and diverse acquaintanceship with other men's work and thoughts. The companion of diffidence is skepticism; it tends to be coupled with knowledge less extensive but derived more from personal experience and analysis, knowledge more precise, and often more fundamental. . . . The support of research men of no ability is an extremely wasteful procedure. It is somewhat worse than burning of money because you can easily dispose of the ashes left by a check, whereas the residue of worthless research is publications which choke the libraries, the bibliographies and the minds of students everywhere."

Gregg has described the research worker thoroughly. Usually possessing little means, self sacrificing and shy, these people devote themselves to their ideas, working long into nights and holidays, with little thought of pecuniary return. They are not to be diverted from their course, and they are to be thought of kindly and treated with consideration despite the fact that they do not conform to the usual social pattern. They are occupied with the world's work and they are stimulated by nothing so much as by devotion to an idea and to a job. The modest salary of the researcher is deprecated, as it encourages the talented man to deviate toward the more lucrative alternative, the practice of medicine. It also forces the best who remain in research to such economic struggles as to produce "a virtually sterile academic society, a professoriate overconcerned with economic security and therefore secretly rebellious or timidly resigned, or the academic career open only to those who have inherited money or married it. Men with energy and common sense but no fortune of their own will refrain from entering or advising entrance into so timid and defenseless a company." The part time man, bound to one city by a local practice which supplements his income, encourages the use of availability rather than ability as the criterion for clinical appointment. Gregg believes that this practice is the most serious present danger to the future of clinical medicine in this country. The thought that the clinician may repress the development of research by undoing the groundwork laid by the preclinical teachers is a provocative one.

From his wide experience Gregg has arrived at a fascinating method for computing academic health. If one divides the professors' salary by the figure that it costs a student per year to live and to attend medical school, a quotient is obtained which if below 3.6 is associated with languishing academic recruitment

and decay of the university. When it is above 6.5 the life of the professors' post is comfortable and well competed for.

The main resources for the support of medical research besides the self-sacrificing researcher and his family are personal friends of research men, public subscription (for example, the President's birthday ball), industry, patenting the results of research, the government, the universities and the foundations. The remarks on support for medical research from government are timely, for it must be obvious to any one with half an eye that the future of medical research stands or falls by the nature of this support. The Medical Research Council in Great Britain is presented as a model because of the quality of its work and its unincumbrance by political or parsimonious factors. This council of eleven members is composed of eight men chosen for their scientific and medical qualifications; one other member represents the House of Lords and another the House of Commons. At present the remaining member, the treasurer, is a distinguished banker. Direct political influence is not likely to affect the decisions of the body. This council consists mainly of a group of experts in medical research with full authority to use and control the public money placed at its disposal, independently of all other bodies. This body, as well as our own National Research Council, has pioneered in a field beset by many thorny problems.

The book points out that about one hundred foundations have been organized within the last ten years, and therefore money possibly has been diverted from universities into these tax free holdings. One feels that this development has catalyzed some modern political thought into punitive plans against these financial giants. Gregg has some advice to spare for these relative newcomers in the field. It has been found that capital grants for endowment or long term grants are healthier than short term grants. Foundation support for a germinal idea is advisable (for example, the Commonwealth Fund in the development of child guidance). The fellowship system has yielded unexpected returns, particularly when the fellows were able to range the world.

This short book is addressed to the entire medical profession, to the medical student, to the student who contemplates entering medicine and to many in the allied and basic sciences. It should be read by any who evince or profess an interest in medical research. It will most certainly result in a reevaluation of the position of the thinking man, for its pages shout the admonition "justify yourself."

Enfermedades de las arterias periféricas. Por el Dr. Alfredo V. di Cío, profesor adjunto de patología médica en la Facultad de ciencias médicas de Buenos Aires. Paper. Pp. 461, with 129 illustrations. Buenos Aires: Librería y Editorial "El Ateneo," 1941.

This work emanates from the First Division of Clinical Medicine of the University of Buenos Aires under the able direction of Prof. Mariano R. Castex, well known in this country, who wrote the prologue. Diseases of the peripheral arteries constitute an interesting chapter in human pathology, not only because much of value remains to be explored, but because new syndromes have appeared which have been proposed as independent entities but which have the one common characteristic of being based on diseases of the arteries or of their smallest ramifications. The author studied some 400 cases exhibiting some disturbances attributable to alterations of the peripheral arteries, the great majority presenting signs of claudication and gangrene in the lower extremities. The work includes a study of these 400 cases in detail, as well as descriptions of the technic and the results obtained with the author's new procedure of employing the injection of a carbon dioxide-oxygen mixture. He believes this constitutes a distinct advance in treatment. The subject is presented in orderly fashion, including generalities and technic of methods of exploration in Part I. Part II is devoted to arterial disturbances of functional origin, and part III to arterial diseases of organic origin. The fourth and final part deals with the treatment of peripheral vascular disease. The author recommends absolute abstinence from tobacco in any form, declaring that he has never seen improvement in any patients under his care unless this suppression of tobacco was demanded. He has observed, moreover, that simple suppression of tobacco was accompanied by the arrest of the disease, causing the initial symptoms to disappear without recourse to any other

therapy. His statistics include a series of cases in which the symptoms improved following the treatment instituted plus the suppression of tobacco but reappeared when the smoking habit was renewed. Abstinence from alcohol also is advised. The author goes into great detail regarding general hygienic, dietetic and medical management, and surgical treatment when it is required. His own procedure includes the use of the carbon dioxide-oxygen mixture. The latter is used in place of subcutaneous injections of carbonic acid. The technic of the injection is related in great detail. Summaries of 72 cases and a bibliography terminate the work.

Synopsis of the Preparation and After-Care of Surgical Patients. By Hugh C. Igenfritz, A.B., M.D., Instructor in Surgery, Louisiana State University School of Medicine, New Orleans, and Rawley M. Penick Jr., Ph.B., M.D., F.A.C.S., Professor of Clinical Surgery, Louisiana State University School of Medicine. With foreword by Urban Maes, M.D., D.Sc., F.A.C.S., Professor of Surgery and Director of the Department, Louisiana State University School of Medicine. Fabrikoid. Price, \$5. Pp. 532, with 55 illustrations. St. Louis: C. V. Mosby Company, 1941.

While the evaluation of surgical risk depends, in the main, on experience and judgment, certain factors under the control of the surgeon can modify and control much of the risk. These factors have become more tangible in recent years and are approaching scientific reality. The ability of a patient to withstand major surgical attack can be definitely increased by proper measures undertaken prior to and succeeding operation. The most important advances in this field are those relating to a better understanding of fluid and electrolyte balances in the body and a better comprehension of shock. This book, intended primarily for surgical residents and practitioners, relates some of the basic problems of surgical care and practical methods of solving them. Besides chapters on fluid balance, transfusion, shock and general measures, specific practical details for handling situations arising during the surgical convalescence are dealt with. Generalities are usually dispensed with in favor of definite and practical detail. While agreement with various techniques outlined will always be lacking, the methods suggested are generally acceptable and represent one good way of treating. References are plentiful and recent; illustrations are clear and profuse, indexing is thorough; all combine to make this book a welcome addition to the young surgeon's library.

Diseases of the Nose, Throat and Ear: A Handbook for Students and Practitioners. By I. Simson Hall, M.B., Ch.B., F.R.C.P.E., Surgeon to the Royal Infirmary, Edinburgh (Department for Diseases of Nose, Throat and Ear). Second edition. Cloth. Price, \$4.50. Pp. 446, with 74 illustrations. Baltimore: William Wood & Company, 1941.

In this small volume, the second edition of a like handbook first published in 1937, certain chapters have been revised and rewritten to conform with modern advances in the science of otolaryngology. This effort is seen principally in references to the sulfonamide drugs and rhinologic therapeutics from the modern physiologic point of view. Considered as a "handbook for students and practitioners," as implied on the title page, it is a remarkably complete though brief summary of the specialty and as such should meet the purpose for which it was designed. Its extreme conciseness produces serious limitations to its use as an adequate guide to actual diagnosis and treatment, but its comprehensive brevity should make it an ideal refresher for undergraduates and practitioners.

Maude Abbott: A Memoir. By H. E. MacDermot, M.D., F.R.C.P. Cloth. Price, \$2.50. Pp. 264, with 11 illustrations. New York & Toronto: Macmillan Company, 1941.

The author of this memoir, who is the assistant editor of the *Canadian Medical Association Journal*, is to be commended on the simple manner in which he has presented the highlights of Dr. Maude Abbott's career. Dr. Abbott, who was one of the first woman doctors of Canada, gained a reputation which was justly earned. Naturally the book will hold extra pleasure for Canadian readers, but it will also hold much interest for any who pass along its pages. Not only does it depict the possibilities that lie in store for those who have the courage, loyalty, tolerance and vitality possessed by Dr. Abbott but it offers intimate glimpses into the habits of some of her colleagues. Some of these colleagues are internationally known. That the book offers amusing moments is to say the least. For example, Dr. Abbott was closely associated with the Osler Memorial

Volume, which appeared in 1926. During this association she was delayed many months in sending a manuscript for Dr. George Blumer's "Bedside Diagnosis." Considerable and spontaneously witty correspondence resulted between the two. Parts of these letters are reproduced in the book. The gem is Dr. Abbott's reference to Dr. Blumer's work as "Blumer's Bedtime Diagnosis," to which Blumer replied "The work doubtless has soporific qualities, but the correct title is "Bedside Diagnosis."

The Premature Infant: Its Medical and Nursing Care. By Julius H. Hess, M.D., Professor and Head of the Department of Pediatrics, University of Illinois College of Medicine, Chicago, and Evelyn C. Lundeen, R.N., Supervisor, Premature Infant Station, Sarah Morris Hospital, Chicago. Cloth. Price, \$3.50. Pp. 309, with 74 illustrations. Philadelphia, Montreal & London: J. B. Lippincott Company, 1941.

The Hortense Schoen Joseph Premature Station of Michael Reese Hospital has a record for saving the lives of premature infants somewhat better than that of most institutions concerned with this field. The record has been accomplished by the introduction of complete control of the environment, the maintenance of aseptic nursing care and the introduction of special techniques for bathing, dressing, feeding and otherwise providing for the infant. In this book the physician who has had charge of this work and the nurse who has been responsible for the meticulous detail have cooperated. Indeed, the work itself is so impressive that it has now been related to the entire program for the care of the premature infant in Chicago. It represents a challenge to all others concerned with similar work.

The Postnatal Development of the Human Cerebral Cortex. Volume II: The Cortex of the One-Month Infant. By J. LeRoy Conel, Professor of Anatomy, Boston University School of Medicine, Boston. Cloth. Price, \$8. Pp. 147, with 220 illustrations on 105 plates. Cambridge: Harvard University Press; London: Oxford University Press, 1941.

This monograph, the second of its kind by the author, describes in detail the cortex of the 1 month infant. It is beautifully illustrated and the printing is excellent. The author finds the "brain of the 1 month infant to be much less gelatinous in appearance and firmer to the touch than the brain of the newborn. He states that the difference in consistency of tissues is clearly noticeable before and after fixation in formaldehyde. The contents of the book include sections on the lobus frontalis, lobus parietalis, lobus occipitalis, lobus temporalis, lobus insulae and rhinencephalon. This is a rare contribution and together with the first volume should be purchased by all neurologists, neurologic surgeons, pediatricians and neuroanatomists. It is a masterpiece.

Source Book of Medical History. Compiled with Notes by Logan Clendening, M.D., Professor of the History of Medicine, University of Kansas, Kansas City. Cloth. Price, \$10. Pp. 685. New York & London: Paul B. Hoeber, Inc., 1942.

This volume includes historical notes by Dr. Clendening and actual reproductions of the original writings, which have achieved a place in the history of medicine in the form, however, of English translations. There is an extensive index, which will aid the physician in reference to the fields in which he is especially concerned. Previously works of a similar character by Camac and Major and the various volumes of selected readings have served as models for this volume, but the author has obviously been guided largely by his own interests. A special feature is the inclusion in this volume of quotations from literature not definitely medical as, for example, some of the writings of Molière, Macaulay and Le Sage.

Clara Barton: Daughter of Destiny. By Blanche Colton Williams. Cloth. Price, \$3.50. Pp. 468, with 31 illustrations. Philadelphia, New York & London: J. B. Lippincott Company, 1941.

This book will delight the lover of biographies. It is well written and almost brings to life the person of Clara Barton. The history of the beginnings of the American Red Cross and the long fight before the United States acceded to the treaty of Geneva is of particular interest at this time. Today, the Red Cross is taken for granted. No one questions its ability to relieve the suffering caused by disaster. Its place on the battlefield is also an accepted fact. Clara Barton is portrayed as a wilful, stubborn person—in fact, just the type that was necessary to carry through such a difficult assignment. The book should serve as an inspiration to the young student who would like to save humanity, as well as make excellent reading.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

BURNS BY PHOSPHORUS

To the Editor.—Can you give me any information concerning burns by white phosphorus (P_4) and phosphorus trichloride (PCl_3)?

J. J. Reason, M.D., Carteret, N. J.

ANSWER.—White phosphorus ignites spontaneously in the air and burns gradually from the surface. It may give rise to serious burns, since even when embedded in the flesh it will continue to burn as long as air can reach it. According to Vedder (The Medical Aspects of Chemical Warfare, Baltimore, Williams & Wilkins Company, 1925, p. 194) first aid treatment is directed toward stopping the phosphorus from burning and toward removal of any of the substance remaining in the wound. The part is immersed in water or is irrigated, and any remaining phosphorus is washed out or is wiped off with a wet gauze sponge held with forceps. The later treatment is the same as that for any other burn. Phosphorus trichloride is a liquid at ordinary temperatures, is noninflammable and gives off a toxic vapor. In the presence of moisture it is extremely hygroscopic and hydrolyzes rapidly, with the formation of hydrochloric acid. Its effect on the skin is not that of a true burn and is not specific for phosphorus but is that of the caustic or the corrosive action of a strong acid. The substance should be removed or neutralized by washing of the affected part with dilute alkali and the wound treated by measures appropriate to any other injury of like severity.

EXFOLIATION OF HANDS AND FEET

To the Editor.—A man aged 43, a commercial airline pilot, complains of peeling of the skin on the ventral surfaces of the hands and feet. This has occurred in attacks yearly since 1935. The disturbance has always been preceded by an acute respiratory infection, usually of a mild nature. The attack of peeling has never occurred at any other time than in the fall of the year, even though the patient may have colds during the other seasons. The hands are first affected, peeling of the epidermis starting at the finger tips and extending cephalad over the palms. After a week's interval the feet are affected in a similar manner. Several episodes of peeling may occur in these locations, after which the skin returns to normal and remains so until another cold develops in the ensuing fall. The patient takes no medication of any kind. There is no history of allergic phenomena affecting him or other members of his family. His general health is excellent. I can elicit no history of exposure of his skin to irritants or other substances during the fall months with the possible exception of the fact that he is accustomed to remove nightshade from his yard at this time of year. He does not wear gloves at any time. Physical examination discloses extensive peeling of the epidermis, most pronounced at the finger tips extending up under the nail beds and cephalad to the wrists. There is no vesiculation, weeping or other eczematous reaction. During the present attack the skin of his feet has not yet become involved. He has a mild trichophytosis between the toes. No other physical abnormalities are discoverable. The blood Wassermann reaction and blood count are uninformative with the possible exception of a 4 per cent eosinophilia. The platelets appear larger than normal but number 540,000. Cutaneous tests with oidiomycin and trichophyton are strongly positive for the former. Microscopic examination of scalings from the cutaneous lesions does not disclose the presence of fungi. Patch tests with the berry, leaf and flower of the nightshade are negative. Any suggestions as to further study or the possible cause of the difficulty would be appreciated.

M.D., California

ANSWER.—The commonest cause of exfoliation of the palms and soles is the disease called keratolysis exfoliativa. This was first described in the American literature and given its name by G. W. Wende in 1919 (Keratolysis Exfoliativa, *J. Cutan. Dis.* 37:174 [March] 1919); but soon after Wende's article appeared J. E. Lane (Some Observations on Keratolysis Exfoliativa, *ibid.* 37:223 [April] 1919) pointed out that Carajon had described it in 1903 under the name desquamation estivale en aires des mains. Lane compares the two descriptions in an interesting manner and adds his own observations. MacKee and Lewis (Keratolysis Exfoliativa and the Mosaic Fungus, *Arch. Dermat. & Syph.* 23:445 [March] 1931) discussed its relation to fungous infections. They found foci of such infection in all their cases of keratolysis exfoliativa and they cited similar results of the study of such cases by others. A few have found fungi in the scales of the dry vesicles on the palms; but MacKee and Lewis did not. They found the mosaic fungus in these scales in potassium hydroxide prepa-

rations. They believed that keratolysis exfoliativa is a part of the picture of fungous infection in human beings. Others, however, still dispute the relation of the mosaic fungus or appearance to such infection. The toe infection in the case under discussion suggests such a relationship, and this is strengthened by the positive reaction to oidiomycin; but such infections are so common that they may be simply coincidental.

The strict periodicity of the phenomenon and the preceding mild disturbance of the upper respiratory tract suggests a much rarer condition, deciduous skin, shedding of the skin. P. E. Bechet (Deciduous Skin, *Arch. Dermat. & Syph.* 37:267 [Feb.] 1938) reported a case, the second mentioned in the American literature since 1911. The first was the one reported by Howard Fox (Keratolysis Exfoliativa Congenita, *ibid.* 3:202 [Feb.] 1921) of a woman whose skin sealed off in large flakes during the whole year. Bechet's patient shed his skin during the whole summer, not at all during the rest of the year. Bechet, on the basis of reddening of the skin previous to exfoliation, considers cases previously reported as shedding of the skin, such as the one reported by Frank and Sanford, reviewed in the textbooks (Ormsby, O. S.: Diseases of the Skin, ed. 5, Philadelphia, Lea & Febiger, 1937, p. 122) as scarlatiniform erythema rather than genuine shedding of the skin. He discusses the differential diagnosis between these. Weidman, in the discussion of Bechet's paper, suggests that genuine shedding may be a "phylogenetic phenomenon" like the shedding of the snake's skin. If the case described in the query is a genuine one of shedding of the skin it is extraordinarily limited.

FAMILIAL AND HEREDITARY CATARACT

To the Editor.—I am confronted with a rather puzzling medicosocial problem. In 1933 I examined the eyes of a woman with congenital cataract. She had three children, a girl, 13, who had cataract, a boy, 10, who had cataract to some extent, and another boy, 15, who did not have cataract. I recently received word from the boy who does not have cataract intimating that he was contemplating marriage. He fears that if he should become a father this trait might be transmitted to his children. He asks my advice as to whether he should undergo the operation of vascelomy to avoid this possible catastrophe. The family history, which I secured from a good friend who is the brother of the woman with cataracts, indicates that she and another brother are the only ones in a family of ten who were so afflicted. It is not even certain that the brother has cataract; it is known only that he goes about with his eyes half closed. He has and has had sufficient vision to enable him to drive a truck. It seems to me that this young man runs little risk of having children with congenital cataract and yet I think there is some risk. I should appreciate an opinion on this problem.

M.D., Missouri.

ANSWER.—From the family history given, which is unfortunately incomplete, it would seem as though cataracts were familial and hereditary in this family. There is no question that cataract can be transmitted in families, as shown in the accompanying table. Green (26th Annual Meeting of the American Ophthalmological Society, 1890, p. 724) reported one family in which twenty-one members were affected. Nettleship (*Royal London Ophth. Hosp. Rep.* 16, part 3) reported on the occurrence of senile and juvenile cataract in one hundred and sixty-seven families; from three to six generations were affected; in one family thirty members in four generations showed the defect.

Milikin (*Ann. J. Ophth.*, March 1903) reported 14 cases of hereditary cataract in three families.

Heredity of Cataract*

Type of Heredity	Number of Families	Total Children	Children Affected	
			Number	Per Cent of Total
Direct heredity, both parents affected	3	15	9	60†
Direct heredity, one parent affected	301	1,012	589	58
Indirect heredity	29	107	45	42†
Collateral heredity	65	312	193	62

* Extract from table on heredity of eye diseases collected by Dr. J. J. MacKee. Blindness and Its Prevention, *Ann. Ophth.*

† Figures too small for sound percentages.

Nettleship and Ogilvie (*Tr. Ophth. Soc. U. K.* 26:191, 1906) studied the Coppock family and reported 20 cases in four generations. Mann (Developmental Abnormalities of the Eye, Cambridge, University Press, 1937, p. 343) stated that in the Coppock family "inheritance was always direct; i. e., a parent of the affected individual always showed the defect and unaffected cases never transmitted to their offspring (the 'once free always free' rule)."

According to Waardenburg (Modern Trends in Ophthalmology, 1940, p. 101) it is now established that both sex chromosomal (gonosomal) and autosomal genes are involved in ocular disorders, but it is not known to which of the twenty-three autosomes of the mature human gametes these characters belong. He also reports that a case of congenital total cataract perhaps belonged to the sex-linked inheritance which is due to recessive genes localized in the X chromosome.

Judging from the data collected by Mann there is evidently greater than normal risk of this marriage producing children with hereditary cataract. It would certainly be the part of wisdom for this young man to refrain from having children.

WASSERMANN TEST IN HUSBAND AND WIFE

To the Editor:—A woman pregnant for the first time has a negative Wassermann reaction and no clinical evidence of syphilis. Her husband had a Wassermann test done, and the result was 4 plus. This was verified in two other laboratories. A second Wassermann test for the woman gave negative results. She was given 3 Gm. of neoparsphenamine, and a week later the Wassermann reaction was negative. Neoparsphenamine injections are being continued irrespective of the negative Wassermann reaction. Williams, in his *Obstetrics*, cites a case in which superimposed pregnancies (from different fathers) resulted in one syphilitic child and one free of syphilis, and it was determined that one father had syphilis and the other did not. The husband of the prospective mother has no clinical evidence of syphilis and gives no history of an initial lesion. Is the antisyphilitic treatment of the mother correct? Should it be continued after the child is born even though the Wassermann reaction is negative? Should the child receive any antisyphilitic treatment? Should future pregnancies be inadmissible before the father is Wassermann negative?

T. J. English, M.D., Philadelphia.

ANSWER:—The information furnished is insufficient. Nothing was stated about the history of the husband's case, nor was it stated whether the cerebrospinal fluid has been tested serologically. Every attempt should be made to find out how long the husband has had syphilis. It is possible that he has old latent syphilis that is no longer transmissible.

Under the circumstances, it was not justifiable to start the wife on the therapy until one had determined the status of the husband. To have done so creates an awkward situation. The usual feeling is that once the patient is started on treatment for syphilis this must be continued and be given in the same manner as if the patient had acquired syphilis.

In this case, however, as far as is known, there is not the least evidence that the patient has had syphilis, and if it were not that she is pregnant the recommendation would be to stop all treatment at once and perform a serologic test once a month. Since she is pregnant, however, it would be advisable to have a consultation with an authority on the subject and to attempt to find out as nearly as possible how long the patient's husband has had syphilis, for if he really has latent syphilis all therapy should be discontinued.

Naturally the child should not receive treatment for syphilis if it does not have the disease.

The answer to the last question will depend much on how long the father has had syphilis and on the result of careful physical examination and laboratory studies.

GASTRIC ULCER AND ANGINA PECTORIS

To the Editor:—Is there any evidence associating angina pectoris with gastric ulcer? Is there any evidence of ulcer being the cause of angina? If the two conditions were present in the same patient would the gastric ulcer aggravate the angina?

R. E. Fowler, M.D., Harrison, Ark.

ANSWER:—There is no evidence that gastric ulcer and angina pectoris occur together with any unusual frequency. Gastric ulcer is a relatively common disease; the simultaneous presence of angina pectoris and gastric ulcer is so rare as to preclude any special association of these two disorders.

Both the heart and the stomach are supplied by the vagal and the sympathetic systems, and disturbances in one organ may be reflected through nerve pathways to the other. It may be clinically difficult to recognize or demonstrate the presence of gastric disease simulating angina pectoris or to establish the cardiac basis for distress referable to the epigastrium or the upper part of the abdomen. Occasionally, however, disease may be found to exist in both the heart and the stomach, and attempts have been made in such cases to establish an etiologic relationship between the two diseases. Gilbert, Fenn and LeRoy have demonstrated that distention of the dog's stomach produces coronary vasoconstriction. Hinrichsen and Ivy, on the other hand, failed to demonstrate this in earlier work. In similar experiments on man, employing artificial methods of gastric distention, Morrison and Swalm expressed the belief that they could demonstrate the reflex nature of attacks of angina pectoris in patients with gastrointestinal disturbances. Despite these

investigations there is no satisfactory proof that a gastric ulcer may be the sole cause of true angina pectoris or that ulcer may play even an indirect part in the anginal pain. Cases have been reported in which treatment of the gastric lesion has resulted apparently in alleviation of the anginal attacks. Eradication of focal infection has been said to accomplish the same result.

HISTAMINE DESENSITIZATION

To the Editor:—Will you kindly let me know the details of the technique for histamine desensitization in cases of general allergy?

M.D., New York.

ANSWER:—Histamine injections are seldom useful or indicated in cases of general allergy. It may be helpful in occasional cases of urticaria and of some types of physical allergy, particularly intolerance to cold. It is not at all certain that histamine injections result in tolerance to larger doses of histamine. The probable action of histamine treatment is an exhaustion of the reactive mechanism of tissue cells. One of the most common techniques of histamine treatment consists in giving small doses of the chemical at frequent intervals, a solution of a histamine salt, such as the phosphate, being used. A dilution of 1:5,000 may be the initial strength used. The dose of 0.1 cc. of this solution can be increased by additional increments of 0.1 cc. each time. Injections are given at first twice daily, later once daily and still later twice weekly. When a dose of about 0.5 to 1 cc. of a 1:2,500 dilution is reached the characteristic histamine reactions occur, consisting usually of flushing of the face, headache and possibly palpitation, and the dose should be slightly decreased. Treatment is to be given, as a rule, for several weeks. Another method of histamine treatment consists in giving 0.5 to 1 mg. of the drug in 500 to 1,000 cc. of an isotonic solution of sodium chloride or of a 5 per cent dextrose solution intravenously by the drip method, about two hours being required to complete the injections. This can be done once daily for several times.

SODIUM BICARBONATE THERAPY AND RENAL STONES

To the Editor:—Is there any relationship between the taking of sodium bicarbonate and other alkalis for gastric disorders and the formation of renal stones?

M.D., New York.

ANSWER:—In a discussion of the formation of renal stones from the ingestion of alkalis used in the treatment of stomach disorders one must exclude secondary calculi or those due to some preexisting pathologic lesion of the urinary tract.

Primary renal calculi are those formed in an apparently healthy urinary tract. Randall has pointed out that there is a precalculous lesion found in a renal papilla which, when it is bathed in calcine urine, forms the nidus for all primary calculi. He referred to this as a calcified plaque which has formed as a reparative process.

A person who uses alkalis for some gastric disorder or for another reason will have an abnormally greater concentration of these substances in the urine than one who does not. With the presence of a precalculous lesion in a kidney there is a greater chance for the formation of calculi in alkali users.

It has been presumed by some investigators that the constant irritation of the renal calices by the phosphatic deposit leads to the exudation of a little fibrin, which cements the calculus. Other writers have expressed the belief that there is little relationship, if any, between the ingestion of alkalis and the formation of renal calculi.

One with any important amount of experience in the handling of patients with urinary calculi is impressed by the high incidence of urinary stones in patients under medical management for gastric ulcer. Regardless of statistics or articles written to disprove this statement, almost all observers in the field consider the foregoing statement to be an absolute fact.

THE USE OF SULFADIAZINE AND SULFATHIAZOLE IN DIA- BETES MELLITUS

CHARLES W. STYRON, M.D.
HARRY BROMLEY, M.D.
AND
HOWARD F. ROOT, M.D.
BOSTON

Treatment of 100 consecutive diabetic patients by means of sulfathiazole and sulfadiazine is here reported with respect to the toxicity of these drugs in diabetes mellitus, their effect on the control of diabetes and the efficiency of the treatment in various types of infection.

Sulfanilamide became generally available in 1937. It was found to be effective against beta hemolytic streptococci, meningococci, urinary tract infections, trachoma, chancroid and lymphogranuloma venereum. To a less extent it was effective in gonorrheal infections, undulant fever and actinomycosis. In 1939 sulfapyridine was widely and effectively used in pneumococcal infections and gonorrheal infections. In 1940 sulfathiazole proved more effective and less toxic in staphylococcal infections, and in 1941 sulfadiazine was introduced as even more efficient against all organisms than the drugs mentioned and, in addition, it was found active in Friedländer infections.

Recently Beardwood and Rouse¹ attributed three cases of diabetic acidosis to the administration of sulfanilamide. Although the presence of acidosis does not necessarily imply the ketosis found in the diabetic with lowered carbon dioxide content of the plasma, the question arises, nevertheless, whether the sulfonamides can be used safely in the treatment of diabetic patients with infections without further serious disturbance of diabetic metabolism. Second, it may be asked whether dosages effective and safe in the nondiabetic may be used with equal effect and with equal safety in the presence of diabetes.

There are many references which bear on the changes encountered in the acid-base balance when sulfanilamide is given. A review of some pertinent reports in this respect may serve to emphasize the necessity for considering the status of the acid-base balance of patients who receive chemotherapy. If such consideration is important in the nondiabetic, then it is even more important for the diabetic, in whom acidosis may be easily precipitated.

Southworth² showed a fall in carbon dioxide content of the plasma varying from 1.9 to 27.3 volumes per cent of 15 patients given a single test dose of sulfanilamide varying from 2.7 to 6.0 Gm. The fall occurred during treatment and up to forty-eight hours after the sulfanilamide was given. Basman and Perley³ showed a prompt change in the reaction of the urine from acid to strongly alkaline while sulfanilamide was being given. Marshall, Cutting and Emerson⁴ produced severe acidosis in dogs by giving doses of 1 to 2 Gm. of sulfanilamide per kilogram. Hartmann, Perley and Barnett⁵ presented evidence to show that the lowered blood carbon dioxide and increased alkalinity of the urine were explained on the basis of primary hyperventilation which produced alkalosis. Beckman, Rossmesl, Pettengill and Bauer,⁶ however, were able to demonstrate that the entrance of bicarbonate into the urine preceded hyperpnea and that, therefore, hyperpnea must be considered a secondary event dependent on the acidosis.

ANIMAL EXPERIMENTS

In studies of the effects of the sulfonamides on animals, certain facts have been reported which again may be useful in anticipating changes to which the patient with diabetes is vulnerable. Feinstone and his associates⁷ found that sulfadiazine is less toxic for mice than sulfapyridine or sulfathiazole. When comparison was made between the effects of the prolonged administration of the three drugs in monkeys, sulfadiazine seemed to produce the least evidence of tissue damage. Sulfadiazine was found to be less conjugated in the blood stream, and the acetylated drug was excreted rapidly in the urine. Since the acetyl derivative is soluble in urine, it was less likely to produce urinary complications. In the same study Feinstone and his associates demonstrated that sulfadiazine in doses of 2 Gm. per kilogram daily produced pathologic changes in the tissues of animals, confined for the most part to the kidneys. The organs of animals receiving only 0.5 Gm. per kilogram or less showed normal organs at necropsy. The blood concentration found in acute

toxic deaths in mice averaged between 170 and 200 mg. per hundred cubic centimeters. Death occurred in eight to twenty days. In mice acute toxicity could not be brought about by oral administration, since blood concentrations did not reach a high enough level. The concentration of the drug in the blood, determined largely by the dosage, seemed closely related to the occurrence of pathologic changes, a point of prime importance in clinical usage.

Greisheimer and his associates⁸ studied the effect of sulfanilamide, sodium sulfapyridine and sodium sulfathiazole on the blood sugar and liver glycogen of rats which had been fasted and of rats which received dextrose after a fifteen hour fast. Three hours after drug administration the animals were killed. A dose of 1.8 cc. of 1 per cent sulfanilamide solution per hundred grams of body weight affected the blood sugar in neither group of animals. A decrease in the liver glycogen occurred in the fasting rats and a rise in the liver glycogen occurred in those which received dextrose. Solutions of sodium sulfapyridine varying from 7.5 to 10 per cent administered in doses of 1 cc. per hundred grams of body weight lowered the liver glycogen and raised the blood sugar of the rats. Sodium

lowered glycogen content of the liver, dehydration and acidosis which characterize the patient with poorly controlled diabetes. As to the exact mode and site of operation of these factors, little information is available."

Climenko and his associates¹² showed that continued administration of sulfathiazole to dogs for ten days in doses of 250 mg. per kilogram daily produced impairment of renal function, as evidenced by elevation of the blood urea nitrogen level and diminution in the urea clearance and excretion of phenolsulfonphthalein. The impairment was reversible. They demonstrated no effect on oxygen capacity or the oxygen and carbon dioxide content of the blood. No effect on liver function was indicated by the bromsulphalein test.

Long, Bliss and Ott¹³ in experimental infections in mice concluded that the inferiority, with equivalent blood concentrations, of sulfadiazine to sulfathiazole in pneumococcal infections is offset by the relative ease with which higher blood concentrations are attained and maintained with sulfadiazine. They found that mice tolerated levels of 25 mg. per hundred cubic centimeters for periods of two weeks without apparent ill effects and without damage to the kidneys, liver or spleen.

Numerous reports deal with the precipitation of acetylated drugs in the kidneys, ureters and bladder. To date little demonstrable damage has taken place in the liver after administration of sulfathiazole or sulfadiazine.

CLINICAL DATA

In the course of the past year we have used sulfadiazine and sulfathiazole in over 100 cases of infection in diabetes. The patients ranged in age from 7 years to 86 years. One patient was 7 years old, 8 were from 15 to 30, 15 from 30 to 50, 18 from 50 to 60 and 58 over 60 years of age. Duration of diabetes varied from one month to thirty-three years. Eight patients had diabetes less than a year, 17 from one to five years, 29 from five to ten years and 46 over ten years' duration. Eighteen of the latter group had diabetes longer than fifteen years. The patients had a variety of cardiovascular and renal diseases. In comparing results obtained in diabetic with nondiabetic patients it is possible that some diabetic patients may come for treatment in a relatively early stage of an infection but that this may be offset by the well known tendency for pyogenic infections to extend rapidly in the diabetic. Actually no clear distinction is possible in this respect between diabetic patients of this series and the nondiabetic.

In table I a total of one hundred and eleven infections in diabetic patients is summarized with respect to improvement following the use of sulfadiazine and sulfathiazole. Among the 100 diabetic patients four deaths occurred. Only 15 patients with pneumonia were included in the series, of whom 1 died. The other patient with "unimproved" pneumonia was a woman aged 27 who had a very stormy clinical course and who finally improved with drainage of a lung abscess.

Our results compare satisfactorily with those of Flippin and his associates,¹⁴ who in April 1941 reported

sulfathiazole in the same amounts had little effect on the liver glycogen but raised the blood sugar. It was concluded from these studies that sodium sulfapyridine inhibits glycogen formation and storage. Wertenberger⁹ reported a rise in the blood pH of rats from 7.52 to 7.66 and from 7.53 to 7.60 respectively after intraperitoneal injections of the sodium salts of sulfapyridine and sulfathiazole. Their data support the view that the high alkalinity of these compounds tends to exhaust the buffer capacity of the body and to produce alkalosis. The effect of infection in the presence of lowered liver glycogen was emphasized by Richardson,¹⁰ who found that in normal rabbits and depancreatized cats there existed a correlation between the amount of glycogen present in the liver and their resistance to the intravenous injection of staphylococci. He also found a lowered titer for agglutinins when poorly nourished cats received typhoid vaccine.

Joslin and his associates¹¹ state that "the causes for lowered resistance to infection in diabetes are still not apparent. It is certainly related to the malnutrition.

200 cases of pneumococcic pneumonia with twenty-eight deaths. Finland, Strauss and Peterson¹⁵ used sulfadiazine in treating 178 patients with pneumococcic pneumonia, of whom 19 died. Previously one hundred and twelve deaths occurred in 687 patients treated with sulfapyridine or sulfathiazole.¹⁶ More recently Billings and Wood¹⁷ reported the use of sulfadiazine alone in 75 cases of pneumococcic pneumonia with but one fatality. In treating critically ill patients they administered sodium sulfadiazine intravenously in order to obtain early effective blood levels. They felt that sulfadiazine is the drug of choice in treating pneumococcic pneumonia.

Of the 52 foot cases 49 improved, but surgical and diabetic treatment given simultaneously may have been responsible. We had eighteen improved urinary infections. One unimproved patient had hydronephrosis and megaloureter requiring nephrectomy. Yet he continued to have some pyuria from the other kidney, in which stones were present. Improvement later occurred and at present an operation on the other kidney is contemplated. The second was a patient with a prostatic abscess who did later improve with incision and drainage of the abscess. The 4 cases of carbuncle, 3 of finger infections and 3 of suppurative adenitis also represent combined surgical and chemical treatment in which the favorable outcome can only in part be attributed to the drugs. In the miscellaneous group was 1 patient with a pyogenic brain abscess and associated meningitis, who died. Also were included ulcers of the leg, hemolytic *Staphylococcus aureus* septicemia, abdominal wall infection, lung abscess, furunculosis, cheek abscess, upper respiratory infection and post-operative pelvic cellulitis. The case of *Staphylococcus aureus* septicemia is the second with repeatedly positive blood cultures in which recovery occurred in our experience with sulfadiazine treatment.

As regards chronic bacterial infections which require prolonged treatment, Trevett, Nelson and Long¹⁸ consider sulfadiazine the drug of choice.

It seems evident that one cannot expect chemotherapy to cure necrotic lesions such as carbuncles and gangrene in the diabetic. However, it seems to control extension of pyogenic infections and to have special advantages in pneumonia and particularly in genitourinary infections, to which the diabetic are notoriously vulnerable.

The organism in the pneumonias was predominantly the pneumococcus and that in the foot infections predominantly the hemolytic staphylococcus, with a few cases in which nonhemolytic staphylococci were recovered. *Escherichia coli* was recovered in practically all the urinary infections. In the miscellaneous cases the hemolytic *Staphylococcus aureus* was invariably found.

The pneumonia patients were usually given an initial dose of 2 or 3 Gm. of either drug followed by 1 Gm. every four to six hours until the temperature remained normal for twenty-four to forty-eight hours. The total

dosage varied from 53 Gm. taken in nine days to 12 Gm. taken in two days. The drug levels varied from 1.6 to 11.4 mg. per hundred cubic centimeters but averaged 5 mg. per hundred cubic centimeters.

The patients with foot infections were given as a rule an initial dose of 3 Gm. of either drug and maintained with 1 Gm. every four or six hours. Total dosage varied from 12 Gm. given in the forty-eight hours preceding major amputation to 113 Gm. over a period of twenty-two days. The drug levels varied from 1.3 to 18.9 but averaged 6.3 mg. per hundred cubic centimeters.

Patients with urinary infections received smaller doses of the drug but were oftentimes given treatment over a much longer period of time. Frequently a patient with a urinary infection was given 1 Gm. every four to six hours for the first twenty-four hours. The dose was then ordinarily reduced to 0.25 or 0.5 Gm. every four hours. One patient received 51 Gm. given as

0.5 Gm. five times a day. Many patients were sent home on small doses of sulfadiazine or sulfathiazole (e. g. 0.5 Gm. three times a day) and were followed in office visits. Blood levels varied from 0.6 to 15.0 mg. but averaged 3.5 mg. per hundred cubic centimeters.

As a rule in the miscellaneous cases it was necessary to give doses approximating those in the foot cases to maintain relatively high blood levels. The highest total dosage was given to a patient with *Staphylococcus aureus* septicemia. She received 113 Gm. of sulfadiazine as 1 Gm. five times a day over a period of twenty-two days. During this time nausea and vomiting were the only toxic symptoms encountered. The blood level in this case varied between 8 and 12.6 mg. per hundred cubic centimeters. The same patient later received 45 Gm. of sulfadiazine given as 1 Gm. four times a day. Again nausea and vomiting were the only symptoms of toxicity. The levels of blood sulfadiazine in the second course of treatment ranged from 5.1 to 14.1 mg. per hundred cubic centimeters.

Toxic symptoms in diabetic patients appear with nearly the same frequency as in the nondiabetic patients of Flippin¹⁴ and of Finland.¹⁵ Finland, Strauss and Peterson published a table of toxic symptoms occurring among 446 patients treated with sulfadiazine in which the toxic reactions approximate those of Flippin and

his associates. They also reported ureteral colic and gross hematuria in a patient with sulfadiazine on the seventeenth day of treatment. At the time the blood level was 19.8 mg. The anuria which developed was relieved by catheterization and pelvic lavage. A case was reported by Quick and Lord¹⁹ of acute hemolytic anemia following the administration of sulfathiazole. A youth aged 19 received 10 grains (0.65 Gm.) of sulfathiazole every four hours, and after 70 grains (4.55 Gm.) jaundice appeared. The red blood count dropped to 840,000 and the icteric index rose to 16.5. There was associated azotemia and hypertension. This case illustrates the comparatively infrequent occurrence of severe toxic effects following moderate dosage. In table 2 the frequency of toxic symptoms in the non-diabetic series of Flippin, Rose, Schwartz and Donn¹⁴ is compared with the occurrence of such symptoms in 100 diabetic patients. Although vomiting, dermatitis and conjunctivitis appear rather more frequently in the diabetic, hematuria was much less frequent. Sulfadiazine is less toxic than sulfathiazole in our group of patients. We have all been impressed with the lack of severe symptoms of toxicity encountered, when constant attention is given to early symptoms and to their prevention by the maintenance of a urinary output of 1,500 cc. daily. There were no cases of gross hematuria, and only 2 patients showed an increase in nonprotein nitrogen due to glomerulonephritis in 1 and severe toxemia from a foot infection in the other. One patient had abdominal pain, associated nausea and vomiting and a level of sulfadiazine of 25.3 mg. per hundred cubic centimeters in the blood but recovered promptly on omission of the drug.

The smallest dose of sulfadiazine causing reaction was 12 Gm. taken over a period of three days, whereas

* Patients died

in the case of sulfathiazole the smallest dose was 13 Gm. in four days. A few patients showed nausea and vomiting on 2 Gm. a day. One patient had nausea and anemia on 29 Gm. taken over a period of 15 days. Only in 2 cases was it necessary to omit sulfadiazine. The degree of conjugation is evident by the percentage of cases showing crystals in the urine. In summary, 46 per cent of the diabetic patients receiving sulfathiazole and 23 per cent of those treated with sulfadiazine showed some mild toxic effects.

FOOT INFECTIONS

In the study of these 52 cases of diabetic foot infections in which either sulfadiazine or sulfathiazole was administered, it is evident that the blood supply

to the foot is of primary importance. Therefore in table 3 these 52 cases are divided into two groups, one consisting of 20 cases in which the dorsalis pedis pulsation was felt, the other of 32 cases in which no dorsalis pedis pulsation could be palpated. The outstanding facts were that in the first group with palpable dorsalis pedis pulsations major amputations were necessary in only 15 per cent of the group, whereas successful local amputation or drainage was accom-

plished in 85 per cent. On the other hand, in the group without palpable pulsations in the feet major amputations were required in 72 per cent of the cases and advised in 6 per cent, leaving only 22 per cent in which successful local amputation or drainage was done. Therefore, though it has seemed that the use of these drugs is advantageous in preventing the extension of acute infection, they are not and should not be used except with constant supervision of experienced surgical consultants. Indeed, it is not only obvious that chemotherapy does not in such cases provide a substitute for surgery, but actually there is genuine danger that dependence on chemotherapy may lead to such delay that the successful surgery is lost.

The following is a case in point:

A housewife aged 61, who had had diabetes of twenty-two years' duration, developed a small lesion on the dorsum of the third right toe two weeks prior to admission. Treatment had been administered locally without response, and gangrene developed in the toe. On admission lymphangitis had extended on the dorsum of the foot to the ankle. The patient was immediately placed on sulfadiazine, 6 Gm. daily. Local incision and drainage with disarticulation of the toe were performed. The patient had a moderate fever from the time of admission. On the third day of chemotherapy nausea and vomiting developed and the temperature rose to 101 F. At this time the sulfadiazine level was 138 mg. per hundred cubic centimeters and the nonprotein nitrogen of the blood 27 mg. per hundred cubic centimeters. The diabetes was under good control. Sulfadiazine was discontinued because of nausea and vomiting. On the fourth day the patient appeared generally improved. On the fifth day, however, she suddenly developed rapid pulse, cough, and dyspnea with numerous bilateral pulmonary rales which, after x-ray examination, was thought to be consistent with bronchopneumonia. The nonprotein nitrogen was 70 mg. per hundred cubic centimeters and the sulfadiazine level 4.3 mg. It was felt that a guillotine operation should be performed, but the patient's condition obviated operation. She died a few hours later.

Had the patient been treated without regard to chemotherapy and a guillotine operation done early, perhaps she would not have died. In such cases, choice of procedure may be most difficult and hazardous. On the one hand, chemotherapy may in some instances prevent extension of infection and vascular thrombosis, thereby protecting the circulation to the part. On the other hand, reliance on chemotherapy may lead to delay, permitting embolism or other complications which may prevent surgery entirely. Table 3 illustrates the great difference between local surgery in

19. Quick, E. D., and Lord, F. D. Acute Hemolytic Anemia Following Sulfathiazole Administration. J. A. M. A. 127:1704-1706 (Nov. 15) 1941.

patients with good and poor circulation. The fact that no amount of drug therapy can make up for deficient circulation is evident.

EFFECT OF CHEMOTHERAPY ON DIABETIC CONTROL

The effect of sulfadiazine and sulfathiazole on the control of the diabetes during the course of infection may be estimated in many ways as, for example, by changes in the blood sugar or in the amount of dextrose that is excreted in the urine, but one of the best indications is the effect on the insulin requirement. The insulin dosage of these patients varied from none to 90 units. Twenty-two patients required less than 10 units, 19 from 10 to 20 units, 31 from 20 to 40 units, 24 from 40 to 60 units, 2 from 60 to 80 units and 2 above 80 units. This requirement was based on the discharge dosage of insulin. In table 4 are summarized the changes in the insulin dosage during treatment of 100 diabetic patients in this series. It is seen that in 45 cases the insulin dose was somewhat increased, the increases being small as a rule, but in a few cases were as great as 50 to 60 units and in 1 case 100 units. In 55 cases no evidence of an increased requirement for insulin occurred. Thus, in 14 cases the insulin dose decreased, probably as a result of improvement in the infection. In 24 cases the insulin dose remained

care must be taken to prevent reactions in patients whose insulin requirement drops with improvement in the infection.

PRODUCTION OF ACIDOSIS

There were no cases in which acidosis developed concomitant with or because of chemotherapy, as indicated by daily tests for diacetic acid in the twenty-four hour urine. As a test, an elderly woman was given 4 Gm. of sulfadiazine; the changes in plasma carbon dioxide, blood sugar and blood sulfadiazine levels during the following twelve hours are summarized in table 5. The patient entered the hospital in the afternoon with gangrene of the foot, lymphangitis half way to the knee, fever, arteriosclerosis, uncontrolled diabetes and in a condition even more precarious than these facts indicate. She was given sulfadiazine in the hope that extension of the infection might be prevented and that the guillotine amputation through the lower leg, to be carried out on the following day, might be done with less danger. As the table shows there was no significant fall in the plasma carbon dioxide content even though the blood sulfadiazine level rose to 8.0 mg. at the end of five hours. It is of interest that in such a patient a rapid increase in the blood level could be obtained without any evidence of toxic symptoms or of impairment of renal function. It is true that the patient received a small amount of insulin and that the blood sugar value fell in a desirable manner during the twelve hours following the dose.

SUMMARY

The use of sulfadiazine and sulfathiazole in 100 consecutive diabetic patients ranging in age from 7 years to 86 years with infections of various types was observed with respect to the frequency of toxic symptoms, the effect of these drugs on the diabetes and their efficiency in controlling the infection.

The chief toxic effects were nausea and vomiting, but these symptoms occurred with no greater frequency than has been reported in a series of nondiabetic patients. Grave toxic reactions did not occur.

Symptoms of toxic nature occurred with sulfadiazine less frequently and in less serious degree than were observed with sulfathiazole.

The avoidance of severe toxic symptoms depends on their prevention by constant attention to the relation between dosage and blood level of the drug, the maintenance of a urinary output of at least 1,500 cc. daily and vigilance in recognizing early symptoms with consequent omission of the drug.

The insulin requirement was increased in 45 cases during treatment, possibly as the result more of the infection than of the drug, as in 55 cases of the series an actual decrease in insulin dosage occurred, presumably because of the control of the infection.

No evidence of acidosis following the use of sulfadiazine or sulfathiazole was observed.

In diabetic foot infections the chief danger is from the diminished blood supply. Although chemotherapy may prevent extension of infections, the danger of allowing delay in performing surgery must be stressed.

The cure of 2 cases of septicemia due to hemolytic *Staphylococcus aureus* together with the striking results in genitourinary infections and in pneumonia give sulfadiazine first place as a chemotherapeutic agent in such infectious complications of diabetes.

the same, and in 17 cases the amount of insulin required during the period of drug administration was equal to or less than the amount of insulin required on final discharge from the hospital.

Diabetic control is manifestly difficult in the presence of infection. This fact is so axiomatic that the progress of infection is easily followed by the manner in which the diabetes behaves. A man aged 40 in our series, who had a carbuncle, required 100 units of insulin daily for control. Yet later the blood sugars were normal and the urine was sugar free without insulin. It would seem, however, that chemotherapy aids in the control of diabetes by controlling infection, and this is borne out by the fact that only 45 per cent of the patients required more insulin in the presence of an infection. Determination of the effect on insulin dosage of a patient under treatment is difficult because changes in diet and activity in patients under treatment are necessary. Thus inactivity in bed increases the insulin requirement. At least it is apparent that chemotherapy had no striking or permanently harmful effect on the diabetes.

Insulin reactions were very rare in the series. The tendency of the blood sugar to remain at an elevated level during infection makes reactions unlikely, but

THE KENNY TREATMENT OF ANTERIOR POLIOMYELITIS (INFANTILE PARALYSIS)

REPORT OF THE FIRST CASES TREATED
IN AMERICA

JOHN F. POHL, M.D.
MINNEAPOLIS

In March 1940 Miss Elizabeth Kenny of Brisbane, Australia, proceeded to America to present to the American medical profession her unique and original method of treating the disease infantile paralysis. The method of treatment which has become known as the Kenny system has been evolved by Miss Kenny as a result of her painstaking study of the signs and symptoms presenting themselves in the acute stage of the disease as she has observed them over the considerable period of years since her graduation as a nurse in 1911.

Fig 1.—Acute poliomyelitis: hamstring tendons Spasm of the hamstring muscles prevents extension of the knee

Her work has been officially recognized by her government in that clinics have been established at various centers throughout the Australian state of Queensland, and the treatment has been made available in the public institutions. Convictions based on this recognition prompted Miss Kenny to seek acceptance by the American medical profession in the belief that more widespread use of the method would be of value to the victims of the disease throughout the world. Realizing at the same time that her work, however successful from a practical point of view, lacked scientific explanation, Miss Kenny sought assistance in the research laboratories of America for the scientific elaboration of her theories.

The first case undertaken by Miss Kenny came under treatment in June 1940. In all, 26 cases in the acute

and subacute stage were admitted to the Minneapolis General Hospital in the fall of 1940 and were personally treated or supervised by Miss Kenny. She was assisted by Miss Mary Stewart Kenny, herself a trained and skilled technician in the Kenny system, who had accompanied Miss Kenny from Australia. A special ward was set up in the hospital for the purpose of observing the methods and progress of the patients, and complete cooperation from the medical staff as well as the nursing staff was offered Miss Kenny. Approximately eighteen months have now elapsed since the beginning of the work in America. As the usually accepted period of recovery in poliomyelitis is considered to be from eighteen to twenty-four months following the attack, it is now possible to state the conclusions which can be drawn from the observation of the Kenny treated patients in comparison with similar experience in the same clinic previous to the use of the Kenny technique. A summary of these cases is contained in the accompanying table. The tremendous and far reaching advantages of the method over any previously recognized methods of treating infantile paralysis makes it imperative that the work of Sister Kenny be made generally known to the physicians of America as quickly as possible.

First it must be made clear that the Kenny method has no argument with any other method of treatment of infantile paralysis for the simple reason that the principles were designed for the management of specific findings appearing in the acute stage of the disease which had never been recognized previous to the work of Miss Kenny. Practically all attempts at treatment by other means have been aimed at the prevention of deformities, usually by splinting and immobilization, rather than by treating the condition affecting the muscles, which ultimately causes the deformities. In short, the Kenny method is a treatment of certain phases of the disease of infantile paralysis, while practically all other methods are in reality treatment of the after effects of the disease.

The disease of infantile paralysis in the acute stage presents three cardinal attributes according to the conception of Miss Kenny, other than the paralysis due to nerve damage. These fundamental characteristics are muscle spasm, mental alienation of muscle and incoordination of muscle function. It is obvious therefore that treatment based on these findings could have nothing in common with a treatment designed for a disease exhibiting flaccidity of muscle and one which does not recognize incoordination as occurring.

The Kenny method of treatment is based on the belief that poliomyelitis in the acute stage is a disease which attacks not only the nervous system but the muscle tissue directly as well. This is an inflammatory process within the muscle, of which spasm is the most distinguishing characteristic. Spasm of muscle is the earliest, the most common and the most damaging finding affecting the muscles in acute anterior poliomyelitis. Paralysis may or may not be present, depending on involvement of the motor cells of the spinal cord, but spasm is the damaging element in the involved muscles. This characteristic is usually associated in the acute stage with pain, and the spasm itself may be the cause of pain. One of the most striking features in the demonstration of the treatment is the prompt relief of pain and the remarkable comfort of the patient within a few days after treatment has been begun. This in itself is sufficiently dramatic and gratifying as to gain immediate enthusiasm for the method.

Spasm is the condition in muscle tending to cause shortening of the muscle. The stiff neck and the tight hamstrings are examples universally accepted as findings in the acute stage of infantile paralysis. It had not been previously considered that spasm may be a feature of the disease affecting all the involved muscles. Examples of the effect of muscle spasm are shown in figures 1 and 2. A muscle in spasm is unable to relax and allow itself to lengthen. As a result of the shortening process, temporary contractures appear which eventually become permanent deformities if the condition remains untreated. A muscle which is allowed to become shortened, besides causing deformities, has lost part of its useful function. The stiff painful contractures of the limbs are too well known to every orthopedist who has treated the disease in the convalescent stage to need further argument for a method which promises relief. The examination of old or

Fig 2—Acute poliomyelitis tendon of tibialis anticus Spasm of the muscle causes the foot to assume the varus position

apparently recovered cases of infantile paralysis offers abundant proof of the damaging effect of untreated spasm. In many cases the hamstrings and back muscles are still tight and shortened, years after the acute process. Deformities may appear even in the non-paralytic form of the disease.

The relief of spasm is the first consideration in the treatment of the acute disease of infantile paralysis. The determination of the presence of spasm in a muscle can quickly be made by the physician from the presence of pain in the muscle or by the fact of limitation of joint motion by the affected muscle. Care must be exercised not to aggravate the condition of spasm by frequent examination or rough handling of the patient. Extreme gentleness in nursing attention is required in order not to cause more pain and spasm in the irritable muscles. Immediate treatment is imperative if serious and permanent damage to the muscle is to be avoided. Treatment must begin as soon as the disease has been diagnosed. A delay as long as three weeks may mean irrevocable harm to the delicate muscle substance. The Kenny treatment employs the use of moist heat. Wool flannel packs of proper size are immersed in boiling

water, wrung twice through a tight wringer at the bedside and quickly applied to the involved area. The materials comprising the pack are shown in figure 3. The pack must accurately cover the entire body of the affected muscle, but joints are left free in order not to give the patient any sense of immobilization of the limb.

Fig 3—Acute poliomyelitis. Miss Kenny demonstrates the application of the hot pack. Note the covering layers in position ready for immediate completion of the pack.

The moist pack is covered with oiled silk and then with dry flannel. The pack is changed every two hours but may be renewed as often as every fifteen minutes if the spasm is very acute. Packs are continued through twelve hours of the day. No ointments are applied to the skin; burns do not occur if the packs are wrung quite dry. The acute spasm with pain will subside usually within a week if treatment is proper. Tendency of the muscle to remain in a state of contraction or

Fig. 4—Acute poliomyelitis Spasm of the hip flexor muscles causes the pelvis to tip forward

shortening may persist for weeks or months, and especially if treatment is instituted some days or weeks after the onset. Hot packs must be continued until the muscle is able to extend itself completely as evidenced by full range of motion of the joint concerned. A remarkable state of health, tonus and vigor in all the tissue of the extremity affected is preserved by this

Summary of 1940 Cases Treated by the Kenny Method

Case No.	Patient	Sex	Age in Years	Duration of Symptoms Before Beginning Treatment	Involvement		Length of Hospital Stay	Result of Treatment and Present Condition
					Paralysis	Muscle Spasm		
1	H. H.	♂	17	8 mos.	Severe both lower extremities; partial upper extremities; partial back; complete abdomen	Contractures back, hamstrings, calves, feet; scoliosis; decided incoordination of muscles	12 mos.	Contractures relieved; scoliosis improved; coordination restored; all muscles improved, walks with crutches; no apparatus; attends outpatient department three times weekly for treatment
2	L. L.	♀	5	3 days	Anterior tibials (transient)	Posterior neck, back, hamstrings, gastrocnemii	12 days	Complete relief of muscle spasm, complete restoration of muscle function; no deformities; normal child; no further treatment
3	C. R.	♂	32	3 days	Complete abdomen, complete both lower extremities	Severe neck, back, abdomen and all muscles of lower extremities	18 mos. (still in hospital)	Complete relief of muscle spasm; no deformities; full range of joint motion; recovery of abdominal muscles; lower extremities flail; stand and take few steps; daily treatment
4	D. G.	♂	7	3 days	Right scapular muscles weak; anterior neck (apparent); bulbar	Posterior neck, back, hamstrings, severe in abdominals	48 days	Complete relief of muscle spasm, recovery of paralysis; no deformities; normal child, full activity; no further treatment
5	R. G.	♂	17	24 days	Severe all extremities, chest, back and abdomen	Generalized severe, especially shoulders, hamstrings and lower extremities	9 mos.	Complete relief of muscle spasm; good recovery in all muscles except left upper extremity, walks with canes; no deformities; no apparatus; attends outpatient department two times weekly for treatment
6	D. J.	♀	19	9 days	Severe back, abdomen, both lower extremities	Posterior neck, back, hamstrings and gastrocnemii	11 mos.	Complete relief of muscle spasm; no stiffness or deformity; good recovery in back and left lower extremity; fair recovery in abdominal muscles and right lower extremity; walks with crutches; no apparatus; attends outpatient department three times weekly for treatment
7	C. C.	♀	8	1 day	Severe abdomen, both lower extremities	Severe posterior neck, back, hamstrings and gastrocnemii	9 mos.	Muscle spasm relieved; slight residual tightness of right gastrocnemius; abdomen recovered; fair recovery of most muscles of extremities; walking without braces or supports; no deformities, attends outpatient department three times weekly for treatment
8	P. S.	♂	11	33 days	Severe all extremities	Severe posterior neck, back, pectorals, hamstrings and gastrocnemii	2 mos.	All muscle spasm relieved; complete recovery of all muscles; no deformities; full activity; no further treatment
9	P. W.	♀	3	30 days	Partial generalized right lower extremity	Moderate posterior neck, back, hamstrings, right gastrocnemius	2½ mos.	All muscle spasm relieved; good improvement in all muscles; slight residual weakness of right gastrocnemius; no deformities; gait normal; no further treatment
10	D. J.	♀	9	3 days	Palate	Moderate posterior neck, back, hamstrings, right gastrocnemius; severe in adductors	33 days	All spasm relieved; no muscle weakness; no deformities; normal child; no further treatment
11	D. H.	♀	12	7 days	Total left lower extremity; moderate right lower extremity	Severe posterior neck, back, hamstrings and gastrocnemii	12 mos.	All muscle spasm relieved; recovery right lower extremity; complete residual paralysis left lower extremity; no deformities; walks well with crutches; attends outpatient department three times weekly for treatment; wears no apparatus
12	L. H.	♂	9	4 days	Slight left scapular muscles	Moderate posterior neck, back, hamstring muscles	25 days	All muscle spasm relieved; no residual paralysis; no deformities; normal child; no further treatment
13	F. S.	♂	6	3 days	Bulbar and encephalitic; very difficult swallowing and breathing; slight weakness left anterior tibial muscle	Severe posterior neck, moderate back, hamstrings and gastrocnemii	5 wks.	All muscle spasm relieved; no residual muscle weakness; no deformities; normal child; no further treatment
14	D. K.	♂	11	2 mos.	Complete right upper extremity; severe left shoulder	Contractures pectorals, biceps, trapezi and hamstrings	10 mos.	All contractures relieved; complete residual paralysis right upper extremity; improvement in left shoulder; has useful left upper extremity; no treatment at present time
15	P. G.	♀	1½	14 days	Left posterior and anterior tibials	Posterior neck, back, hamstrings; severe left gastrocnemius	10 wks.	All muscle spasm relieved; retained slight tightness of left gastrocnemius; partial return of anterior tibial; no deformity; no further treatment
16	W. K.	♂	6	2 days	None	Posterior neck, back, hamstrings; severe left gastrocnemius	10 wks.	All muscle spasm relieved; no deformities; normal child; no further treatment
17	A. A.	♀	33	5 wks.	Severe both lower legs; weakness of abdominal muscles	Contractures of gastrocnemii and hamstrings	10 mos.	Contractures improved; fair return of muscle power; walks well with crutches; no further treatment
18	J. L.	♂	7	20 days	Severe right shoulder and scapular muscles	Right pectorals major, posterior neck, back and hamstrings	8 wks.	All muscle spasm and shortening relieved; relief of paralysis of right deltoid; shoulder improved with scapula; receives home treatment
19	J. S.	♀	7	7 days	Severe generalized left lower extremity	Severe posterior neck, back, abdomen, hamstrings and gastrocnemii	13 mos.	All muscle spasm relieved; no deformities; much residual paralysis left lower extremity; walks well with crutches; attends outpatient department three times weekly for treatment; wears no apparatus
20	A. Q.	♀	15	9 days	None	Moderate posterior neck, back, hamstrings and gastrocnemii	17 days	All muscle spasm relieved; no deformities; normal child; no further treatment
21	R. L.	♂	4	7 days	Severe left lower extremity	Severe posterior neck, back, abdominals, hamstrings and gastrocnemii	7 mos.	Complete relief of muscle spasm; residual paralysis of left lower extremity; no deformities; walks well with manual assistance; attends outpatient department for treatment at intervals; parents were instructed in treating this patient
22	T. F.	♂	1½	4 days	Slight right lower extremity, generalized	Moderate in posterior neck, back, hamstrings and right calf	1 mo.	Complete relief of muscle spasm; full recovery of all muscles; normal gait; no deformities; no further treatment
23	W. C.	♂	20	3 days	Weakness right deltoid; moderate generalized both lower extremities	Right pectorals major; severe posterior neck, back, hamstring and gastrocnemii	7 mos.	All muscle spasm relieved; recovery of right deltoid; slight residual generalized weakness of lower extremities; walks well; no deformities; no further treatment

Summary of 1940 Cases Treated by the Kenny Method—Continued

Case No.	Patient	Sex	Age in Years	Duration of Symptoms Before Beginning Treatment	Involvement		Length of Hospital Stay	Result of Treatment and Present Condition
					Paralysis	Muscle Spasm		
21	R. N.	♀	9	3 days	Bulbar; oematose; no paralysis	Posterior neck, back and hamstrings	26 days	All muscle spasm relieved; no deformities; normal child; no further treatment
25	V. J.	♂	21	2 days	Weakness right shoulder and left hand; complete paralysis both lower extremities	Severe pectoralis major and severe posterior neck, back, hamstrings and gastrocnemii	15 mos. (still in hospital)	All muscle spasm relieved; recovery of shoulder; weakness intrinsic muscles of left hand; complete paralysis of both lower extremities; no deformities; stands but does not walk; daily treatment
26	M. H.	♂	20	3 mos.	All extremities when acute; chest; in respirator; moderate generalized residual weakness left upper extremity and both lower extremities	Contractures pectorals, back, hamstrings; cavus left foot; in-coordination	4 mos.	All contractures and stiffness relieved; all muscle power improved; slight residual weakness of left upper extremity and both lower extremities; no deformities; walks very well; no further treatment

method, and freedom from circulatory and trophic changes are strikingly noteworthy. Figures 4 and 5 illustrate the effect of relief of muscle spasm by the Kenny treatment when promptly applied in the acute case of poliomyelitis.

With the relief of spasm begins the true restoration of function of the normal bodily mechanics. Spasm, besides the actual damage to the muscle tissue, has a further disturbing effect on the neuromuscular system. It must be kept in mind that motion of a joint in any given plane is a matter of control by opposing muscles. As the flexor begins to contract, the extensor relaxes or pays out slack in a graduated manner so that smooth joint motion results. The extensor, however, maintains a certain amount of tonus so as to be able to reverse the motion by contracting on instantaneous notice. Opposing muscles do not ordinarily contract at the same time. A muscle in spasm is a muscle attempting to contract. Spasm in the extensor will result in relaxation of the flexor of a joint. Furthermore, the flexor will refuse to pull against the extensor which is painful. The result is that the flexor in this case ceases function, although it may be quite normal. Such a muscle appears to be paralyzed, whereas in reality it is only nonfunctioning. It has become divorced from the motor pattern or alienated from the voluntary center regulating motion. It must be restored, and it can be made to function by teaching the patient awareness of the muscle and of its normal action on the joint. This is first done by the process of stimulation, that is of exciting the proprioceptive nerve endings in the muscle and tendon which normally inform the central nervous system of the position and motion of the joint. Alternately lengthening and shortening a muscle within its normal range of contraction by moving the joint in a small arc will serve to do this, care being taken, however, not to stretch or stimulate the opposing muscle which is in spasm. This procedure may be repeated daily until such time as the spasm has been relieved in the opposing muscle by the use of the hot fomentations. The patient is then gradually retrained in the use of the alienated muscle, first being taught the position and action of the muscle, but being allowed no voluntary joint motion until proper function of the muscle has been restored. Only by insisting that the muscle contract, but purely in a mental sense at first, when it is nonfunctioning, can eventual reestablishment of smooth coordinated motion of opposing muscles be secured. After normal rhythmic action of muscles is imprinted on the motor center, the patient is allowed voluntary effort.

To allow a patient to make haphazard motions of a joint in the presence of nonfunctioning muscles is to

invite a state of incoordination. The patient makes such motions by the process of substitution. Consider the hip joint as an example. Normally the hip is flexed by the iliopsoas. The opponent is the hip extensor (hamstrings). Assume that the hip flexor ceases function. To flex the hip the patient may substitute the adductor (adductor longus, brevis and magnus). To gain mechanical advantage for these muscles in their new function, the hip is now externally rotated. Contraction of the adductors is normally associated with relaxation of the hip abductor (gluteus medius and minimus). It is unlikely that the hip extensor will pay out slack, at least smoothly, for contraction of the hip adductor if it is substituted for the flexor. Smooth motion is lost, and incoordination is established. This condition may become permanent. Only by carefully guiding every motion of the patient from the beginning of treatment can this undesirable state be avoided. The patient can be allowed no voluntary effort in muscle contraction in the presence of any incoordinated muscle action. He must be kept quiet in bed, being turned and cared for by the attendant until such time as proper muscle function is again restored. Once muscles are working in correct and harmonious action, use of the extremity serves to reinforce the nerve impulses retrained to their proper order.

The Kenny method employs no splinting of any kind. On the basis that spasm is the state affecting the muscles, it follows that splints would tend to aggravate the irritable muscle and increase the spasm. Rigid immobilization also tends to encourage shortening of muscle and resulting permanent contractures. Splinting also interferes with the application of moist heat. Most splinted extremities suffer from permanent trophic and circulatory changes because of failure of treatment of the tissues in the acute stage of the disease. The idea of splinting is to prevent contractures and deformities. While it may prevent contractures in flexion it will not prevent contractures in extension, a condition practically as damaging, as far as function is concerned. The Kenny method particularly stresses the avoidance of any form of immobilization. The patient is placed on a firm bed in the normal position of rest. This position is illustrated in figure 6. Even clothes are omitted from the patient, warmth being obtained by using flannel blankets for sheets. An upright board placed at the foot of the bed serves to stimulate the normal standing and postural reflexes. This is in no sense a splint. During the period of active spasm, usually lasting a week, and especially in the presence of any spasm of the calf muscles, the feet are not placed against the foot board. To do so would aggravate the spasm. In the 26

cases reported here no splints of any kind were applied during the entire course of treatment. It can be unreservedly stated that no deformities of any kind occurred in any of these cases as a result of the omission of splinting or immobilization.

It is well known that many patients with infantile paralysis do not have the paralytic form or recover without treatment. Recovery of these patients does not mean that the patient is restored to normal. Careful scrutiny of these patients even years after the disease will disclose that the back or hamstring muscles are still tight and shortened in many cases. Curvature of the spine and other deformities are seen to occur in these cases even when there was presumably no paralysis. While the inclusion of this type of case in the present report might seem open to question in a discussion of the therapy of infantile paralysis, the treatment of these patients is as important as it is of those who have real paralysis. Kenny treatment of this type of the disease will truly restore the patient to normal. Most of the patients are in fact better physical specimens after the training than they were prior to the attack of the disease.

Statistical comparison of the Kenny cases with any other series of cases is a practical impossibility. Paralysis occurs in each, but muscles that are soft, flexible and receptive can hardly be compared with those which are shortened, fibrosed and inelastic. A paralyzed leg which has good circulation cannot be compared with one which is cold, damp, clammy and blue. A paralyzed extremity which has full range of joint motion can hardly be compared with one which is stiff and deformed, however lifeless the muscles in the two might be. No claim is made of a cure for paralysis; there is no cure. There is no argument with the recognized concept of the relationship between the muscle fiber and the anterior horn cell of the spinal cord. A full appreciation of the value of the Kenny method can be obtained only by examination of the patients. The comfort of the patient, the warmth and life in the affected members, the absolute freedom from deformities, the

a feature of the disease, but paralysis proves after all to be a minor consideration in most cases of infantile paralysis. Muscle spasm and incoordination are far more damaging to the bodily mechanics. The Kenny method when properly applied will reduce the crippling effects of the disease of infantile paralysis. Within the

Fig. 6—Convalescent poliomyelitis basic position in bed maintained by patient during the course of treatment

Fig. 5—Same patient as in figure 4. Spasm of the hip flexors has been relieved by the Kenny treatment. Note the correction of the pelvic tipping.

receptiveness of the weakened muscles to stimuli, the ability to walk without supports in the presence of considerable weakness, the effortless movement of joints with smooth coordinated muscle function are all points which make the Kenny method of obvious value to those faced with the task of treating and salvaging the victims of this most dreaded disease. Paralysis is unfortunately

limits of the present knowledge and means of treatment of the disease it offers the patient the maximum assurance of recovery and restoration of function of his motor system. Deformities have been outlawed.

CONCLUSIONS

As a result of the demonstration carried out at the Poliomyelitis Clinic at the Minneapolis General Hospital for eighteen months beginning in the fall of 1940, it can be stated that:

1. Miss Kenny has conclusively shown that spasm is the condition affecting the muscles in the acute stage of infantile paralysis. Spasm is the cause of deformities. Spasm causes mental alienation of muscle, a pseudo-paralysis occurring in the opposing muscles to those in spasm, in which those opposing muscles are divorced from the voluntary motor pattern and cease functioning. Spasm plus mental alienation causes incoordination of muscle action, resulting in further damage to the motor mechanism.

2. Miss Kenny has demonstrated a method of treatment for the symptoms she describes which diminishes the crippling after-effects of the disease of infantile paralysis.

3. At the end of eighteen months after beginning the Kenny treatment of a series of 26 patients in the acute and subacute stage it can be stated that these patients

have all made a far more satisfactory recovery than they would have made by any previously known method. No deformities have occurred, in spite of the complete omission of splinting.

4. The methods as demonstrated form a complete system for the treatment of the neuromuscular aspects of the disease.

5. Incorporation of the principles of the Kenny method with those of other methods for the treatment of infantile paralysis would prove unfeasible, as the Kenny method is based on previously unrecognized symptoms of the disease.

6. The method should be immediately adopted as the fundamental treatment of the disease of anterior poliomyelitis. As the condition affecting the muscles appears with the onset of the disease, it is imperative that treatment be instituted as soon as the diagnosis is established.

An additional series of 28 cases occurring in the fall of 1941, all coming under treatment in the acute stage, have presented very satisfactory progress to date. These cases will show even more remarkable recovery when viewed at the end of the treatment period. The fact that these cases were treated early and that the medical and nursing staff were better prepared to carry out treatment by virtue of the experience gained with the 1940 series will insure a maximum recovery in the 1941 series. These cases will be reported in detail later.

NEW YORK

It is our purpose in this paper to discuss the treatment of anterior poliomyelitis in the acute stage as it was carried on at Willard Parker Hospital in 1941. We wish to emphasize the fact that our treatment at the present time is entirely symptomatic—more specifically that we do not use serums,¹ sulfonamides, spinal fluid drainage, electrical ionization or stimulation, or any medication intended to alter the disease process. We accept the explanation that in virus diseases the virus has already attached itself to the body cell before clinical symptoms occur. In the case of poliomyelitis, this fact was demonstrated by Kramer and Parker² in 1933, when, in the anterior horn cells of monkeys inoculated with the virus, lesions were found before the animals showed clinical signs of the disease.

We are aware of the fact that the 1941 epidemic was comparatively small in this city, but we feel that the fewer cases offered opportunity for careful study.

A total of 71 patients was treated, ranging in age from 8 months to 28 years. The cases were classified as follows: nonparalytic, 12; bulbar, 5; bulbar with neck involvement, 6; bulbar and spinal, 5; spinal, 43. No patients with cerebral manifestations were seen, and no deaths occurred.

General therapeutic measures consisted of complete bed rest, adequate fluid and vitamin intake, and sedation as necessary. In the cases in which there was bladder paralysis, catheterization was indicated and, if necessary, an indwelling catheter was used until function returned. Constipation was frequently encountered, especially in patients with paralysis of the abdominal muscles, so that enemas were given as needed; but very few cathartics were used. Laboratory procedures included complete blood counts, urinalyses and examination of the spinal fluid.

In the treatment of patients with bulbar paralysis, painstaking nursing care was essential. Patients unable to cough up or to swallow mucus which had accumulated in the pharynx were placed in the prone position with the foot of the bed elevated. This position, as suggested by Durand,³ Stimson⁴ and others, is helpful in allowing the secretions to drain from the nose and mouth. Gentle suction with a soft rubber tube was also used. These patients were fed by a Levine stomach tube until the ability to swallow returned. If vomiting occurred, parenteral fluids were given. Because of the frequent misuse of the respirator in bulbar cases, a special point is made of the fact that in respiratory distress due to mucus accumulation the respirator is not only not indicated but definitely contraindicated. This treatment of cases with bulbar involvement is not new, but because of the danger of aspiration pneumonia we feel that it should be emphasized.

Of the 12 nonparalytic cases, 2 were treated by the Kenny method, and the remaining 10 were treated by complete bed rest and discharged at the end of three to four weeks, symptom free. Eight of the latter group were seen in the follow-up clinic four months after the onset of the disease and, though apparently free from paralysis, showed, on careful examination, the presence of spastic muscle groups with resulting deformity due to muscle imbalance. In 3 of the 8 cases there was unilateral spastic involvement of the back muscles, resulting in beginning scoliosis.

Forty-eight of our patients had spinal involvement. Included in this number are those with associated bulbar paralysis. The spinal involvement ranged from a paralysis of a single muscle group to an extensive paralysis including all four extremities, intercostals, the diaphragm and the abdominal muscles. Thirty-one patients were treated by orthodox methods from August 8 until September 23. On admission, a detailed muscle analysis was not done; hence, in the summary given, loss of function rather than single muscle involvement is described. Thus, of 27 patients, there were noted inability to flex the neck, 5; inability to abduct the arm, 5; inability to flex or extend the forearm, 16; finger and hand weakness, 3; gluteal weakness, 2; respiratory distress (due to paralysis of intercostals and diaphragm), 1; weakness of lower extremities, 22; inability to void urine, 3. As mentioned previously, in a given patient this involvement varied from a single paralysis to an extensive paralysis of several muscle groups.

Toronto splints⁵ and plaster casts were used for immobilization. In this group of patients atrophy, often pronounced, and deformities were noted during the second and third weeks. As is customary, these patients in the third to the sixth week of their disease were transferred to various orthopedic hospitals for further treatment. Seventeen were seen four to five months after being transferred. In every case we found limitation of motion due to tight and contracted muscles. In almost every instance there was gross substitution and muscle incoordination. That the contractures were apparently due to the immobilization may be demonstrated in the following illustration:

A 3 year old patient was admitted with complete paralysis of the deltoid and only minimal weakness of the biceps and triceps. Forearm extension and flexion could be performed actively by the patient. The involved arm was placed in a Toronto splint with the arm flexed at the elbow at an angle just over 90 degrees. Six weeks later the strength of these muscles was unchanged, i. e. the deltoid paralysis continued, as did the minimal weakness of the biceps and triceps. At that time the patient was able to flex the forearm, but neither passive nor active extension was possible beyond an angle of 90 degrees. The biceps tendon was somewhat rigid on palpation. These findings suggest that this limitation of motion was a result of continued biceps spasm during the immobilization.

Similarly, in all cases in which leg splints or casts were applied there was definite loss of motion at the knee due to contracture.

KENNY METHOD

As described in the American Literature by Cole and Knapp,⁶ Sister Kenny emphasizes three cardinal symptoms in poliomyelitis: primarily muscle spasm and subsequently muscle incoordination and mental alienation. The symptomatic treatment of these three manifestations by means of hot packs, passive motion and muscle reeducation comprises the Kenny treatment.

So that this terminology may be clearly understood, the following illustration is given:

In a patient with apparent paralysis of the deltoid, one finds spasm in antagonistic muscles such as the pectoralis and the latissimus dorsi, and in substituting muscles such as the suprascapular group. If such a patient attempts to abduct the arm, the aforementioned spastic muscles contract further, resulting in an incoordinated movement. Continued active attempts at abduction result in further alienation of the involved muscle—the deltoid—and further tightening of the spastic muscles.

At the Willard Parker Hospital the Kenny treatment was carried out in the following way: A careful physical examination was done to evaluate the extent of weakness and the sites of hyperactive spastic muscles. Bed boards were placed under all mattresses, and a box was put at the foot of the bed, against which the patient was instructed to place the soles of his feet. He was encouraged to lie in bed with his extremities in the same position as in standing. No pillows were permitted. When the patient was lying on his abdomen, the box was removed and the feet were allowed to protrude over the end of the mattress. Hot packs were applied wherever spastic muscles were found. The entire back, from the head to the heels, was invariably included in the spasticity. These packs consisted of pieces of flannel or old blankets which were dipped in

hot water, about 110 to 120 F., wrung dry by hand and applied directly to the involved part. These were then covered with a dry blanket. Packs were applied for fifteen minutes every two hours during the day and every four hours at night. During a fifteen minute period a pack would be reheated about four times. This technic varies somewhat in detail from Sister Kenny's present technic, but the principle is the same.

Passive exercises were started on the first day of the treatment; the range of motion extended to the point of pain or spasm. Several passive movements were executed for each involved muscle group twice daily. After three or four days, when pain and tenderness were greatly reduced, reeducation was begun. Patients over 3 years of age were allowed to feel the difference between a relaxed and a contracted muscle. The paralyzed or "alienated" muscle was then indicated and attention called to its point of insertion. When the involvement was unilateral, this step was often simplified by using the nonparalyzed side for comparison and demonstration. During the passive movements the patient was instructed to relax completely, focus his attention on the selected muscle, especially its insertion, and try to establish a mental awareness of the action of that muscle. When a muscle responded during passive exercises, gradually increasing tone in the muscle and its tendon was noted by the examiner. In regions where the tendons lie close to the surface, such as the dorsiflexors of the feet and toes, this increasing tone was visible.

At the end of the passive exercises, the patient was permitted to attempt one active movement. When substituting groups contracted during passive or active movements, the patient was instructed to relax and, if he was unable to cooperate, reeducation was abandoned for that day and more frequent hot packs were applied. At the onset, muscle reeducation was carried out twice daily and, as the patient improved, once daily. The range of passive motion was gradually increased as pain and spasm subsided. Hot packs were given during this entire period and complete bed rest continued. All active movements were assisted, and were not performed against resistance or gravity. During our period of observation, which was up to two and one-half months, many muscle groups remained under this regimen, while others were allowed to progress to the stage of independent active motion. The indications used at Willard Parker Hospital for beginning this next state were:

1. No evidence of spasm during full range of passive motion in (a) the selected muscle or muscle groups, (b) antagonistic groups, (c) substituting groups.

2. Ability to perform a coordinated active movement without substitution.

In this arbitrarily named second stage of treatment the hot packs were discontinued and more activity was permitted. If, at any time, spasm recurred in the selected group or related muscle groups, or if substitution was noted, the first stage of treatment was resumed. Careful observation was essential throughout the entire period of hospitalization so that beginning spasm in previously uninvolved areas might be detected and treated early. Especially important was that time when weight bearing had first been permitted.

Extent of improvement was judged by absence of atrophy and substitution, as well as by the return of function and strength.

OBSERVATIONS ON THE KENNY TREATED PATIENTS

On September 23 the Kenny treatment was started at Willard Parker Hospital. Eventually all patients present in the hospital at that time and all subsequent new admissions were included, giving a total of 28 cases, which were classified as follows: nonparalytic, 2; bulbar and spinal, 4; bulbar with only neck involvement, 5; spinal, 17. Fourteen of these patients received the treatment from admission; the remaining 14 were started at times which varied from the first to the seventh week of illness. So that a comparison may be made of the total involvement of this group with that of the earlier group which received orthodox treatment, the following summary is presented. (A detailed analysis of the paralytic and spastic involvement is given in the individual case histories.) Thus, in 26 paralytic cases, there was noted inability to flex the neck, 12; inability to abduct the arm (paralysis of entire shoulder girdle), 5; inability to flex or extend the forearm, 10; weakness of intrinsic finger and hand muscles, 1; respiratory distress (intercostals 2, diaphragm 2), 4; pronounced scoliosis (quadratus lumborum weakness), 1; paralysis of the abdominal muscles, 6; paralysis of the lower extremities, 20.

Of the 28 patients, 2 were nonparalytic. One (patient 44) showed pronounced spasm of the dorsum of the neck, the back and the hamstrings, which responded to treatment within three weeks. Three months after the onset of the disease there was no evidence of scoliosis. There was no follow-up on the other.

Two patients (58 and 59) showed an interesting picture. Both were boys, 13 and 19 years of age, respectively, with well developed muscular systems. On admission, 1 had minimal weakness of the abductors of the left thigh, while the other had minimal weakness of the right quadriceps, hamstrings and gastrocnemius. In neither of these patients could weakness be detected at the end of the second week of the illness. Though the clinical course was extremely mild, both patients showed such severe spasm of the dorsum of the neck, the back and the hamstrings that active and passive flexion of the trunk was impossible. These patients received hot packs during the first two weeks, and thereafter the packs were supplemented with one to three hot baths daily. In the sixth week of the illness these patients were able to flex the trunk when the knees were extended. This action at that time, however, was still limited greatly by the spasm.

In 12 cases there was inability to flex the neck and severe spasm of the dorsum of the neck. Five of these were bulbar cases, 4 were spinal cases and 3 showed bulbar and spinal involvement. In this group the date of onset varied from August to December. The two latest patients are still showing signs of improvement, while the remaining 10 patients have shown good to excellent return of function and power. Atrophy was seen in 2 patients in whom the Kenny treatment was begun in the fifth and seventh weeks of illness. It is interesting to note in this group that the extent of improvement seems directly proportional to the time of introduction of the Kenny treatment; i. e., in those patients so treated from the onset of their disease, lack of atrophy and substitution is a constant observation.

There were 4 patients with complete deltoid paralysis. One of these (patient 67) had extensive paralysis of the entire upper extremity, including the shoulder girdle, and showed spasm in the pectoralis, latissimus dorsi and triceps on the affected side. This presence of spasm in completely paralyzed muscles was noted

frequently. At the end of seven weeks this patient had complete range of passive motion of the involved arm but continued to show complete paralysis. However, at that time beginning contractions could be felt in the involved muscles during passive exercises. When seen in the twentieth week of the disease, there was beginning return of function in the muscles of the hand and forearm. Two patients (53 and 54) with deltoid paralysis had contractions on passive motion in the second and third weeks of the disease, and these patients showed return of deltoid function four months after the onset with minimal weakness and substitution. The fourth patient in this group (patient 63) had congenital hemangiomas of the involved arm, and at the time of discharge there had been no return of deltoid function.

There were 10 patients with paralysis of the dorsiflexors of the foot. At the end of four months, 2 of these patients (68 and 70) still showed complete paralysis. However, there was minimal atrophy and substitution, and no contracture of the achilles tendon. The other 8 patients had return of function. At the end of four months there seemed to be fair to good return of strength in all the muscles. Only 1 patient (patient 62) showed a deformity which was minimal in the third month. This patient had been admitted in the second week of his disease with beginning contracture of the achilles tendon. During the treatment this deformity became less apparent. It is interesting that his clinical course at home had been mild and that the diagnosis of poliomyelitis was not suspected until a limp was noted when the child was allowed out of bed.

Three patients (55, 61 and 66) had apparent intercostal paralysis with resulting difficulty in breathing. All had pronounced pectoral spasm. The respiratory rate of 1 of these patients remained at 12 per minute for a period of over eighteen hours. Frequent packs were applied to the spastic pectoral muscles. Coincident with the relaxation of these muscles, as determined by passively abducting the arms, there was return of normal chest excursion.

Four patients had pronounced paralysis and 3 showed some weakness of the anterior abdominal muscles. It was in this group of patients that persistent constipation was noted. We feel that involvement of the abdominal muscles is easily overlooked in the acute stage, as evidenced by its infrequent mention in many of the detailed reports of larger epidemics. Because of the persistent spasm of the back and hamstrings, return of function in the abdominal muscles is difficult to evaluate at this time.

One patient (patient 57) presented a decided left lumbar scoliosis on admission. This was associated with spasm of the right quadratus lumborum and apparent paralysis of the left quadratus lumborum. At the end of three weeks there was no evidence of scoliosis when the patient was at rest, and at the end of four months there was no deformity seen when the patient was in the sitting position.

Fourteen patients had paralysis of the thigh muscles, including the quadriceps, hamstrings, adductors and abductors. Since the leg involvement was bilateral in some patients a total of 20 lower extremities were involved. Only 1 of these patients failed to show any return of function after four months. No limitation of passive motion and hence no contracture deformities were found in this group four months after onset. Two of the patients have minimal atrophy. As has been

pointed out by Sister Kenny, spasm of the adductors and of the sartorius was frequently detected in this group, even when these spastic muscles had complete loss of power and function.

Ten patients were seen with involvement of arm muscles, usually biceps and triceps paralysis, with supinator and pronator weakness. Only 1 patient (patient 67) failed to show appreciable return of function. In this case paralysis of the deltoid was present and was described with that group of cases. The remaining 9 patients, seen four months after the onset, showed return of useful function and strength. Movements were well coordinated, and no spasm or substitution was seen.

It is still too early to make any statement as to the eventual recovery in these 26 paralytic cases. However, the following observations have been summarized:

1. Spastic muscles were found in all patients. This spasm was noted in otherwise uninvolved muscles as well as in weak and paralyzed muscles. It was relieved by hot packs.

2. In general, the return of unrestricted passive motion took place weeks and months earlier than when orthodox treatment with splinting was used.

3. Complete comfort, at rest, was enjoyed by all patients after one to three days of hot packs. Older patients, especially those who had been in splints, remarked on the comforting effect. Sedation was practically never necessary in this group.

4. In performing passive exercises with a completely flaccid muscle, the examiner would feel tone in that muscle long before the patient became aware of it, and frequently several weeks before the patient had any voluntary control over the muscle.

5. During the period of recovery the patient frequently illustrated what Sister Kenny calls "mental alienation." Although able at the end of one day's exercises to perform a coordination action with a given muscle or muscle group, the patient would completely forget on the following day how that action was performed. However, after several passive motions the patient would again remember the action.

6. In 4 patients under 3 years of age, no attempt at substitution was noted. When muscle function returned in these patients, coordinated movements were seen.

7. While six to nine packs in twenty-four hours of the type described were adequate for relaxation, three to four were not, as was evidenced when there was a temporary diminution in the nursing personnel. During this time an increase in the amount of spasticity was noted in practically every patient.

8. The tendency toward atrophy and deformity was minimal in this group. In fact, it was rarely seen in patients treated from the onset of the disease. The general condition of the skin and muscles was excellent. No burnus occurred.

CASE HISTORIES

ORTHODOX TREATMENT

NONPARALYTIC

CASE 1.—R. E., a 16-year old white youth, admitted on Sept. 4, 1941 with a three day history of sore throat, fever up to 104 F., pain in back of neck, general malaise, diplopia, and a constricting feeling in the throat, had had a left mastoidectomy in 1925, repeated in 1936. He had slight cyanosis of the lips and finger tips, absent ankle and knee jerks and upper abdominal reflexes, pain in the lumbar spine on flexing the head; no weakness. There was a low grade fever for one week; the

course otherwise was uneventful. Treatment, bed rest. Spinal fluid, 100 cells per cubic millimeter; 98 per cent monocytes; protein 29 mg. per hundred cubic centimeters. Discharged, September 19. Follow-up, Dec. 17, 1941, occasional difficulty in swallowing.

CASE 2.—F. C., a 10 year old white boy, admitted on Aug. 7, 1941 with a three day history of headache, loss of appetite, vomiting and pain in the back on flexing the neck, had slight nuchal rigidity; temperature, 101 F.; no absent reflexes. The course was afebrile after the first day. Treatment, bed rest. Spinal fluid, August 5, 270 cells per cubic millimeter; 60 per cent lymphocytes; 40 per cent polymorphonuclears; protein 27 mg. per hundred cubic centimeters; August 8, 26 cells per cubic millimeter; 100 per cent monocytes; protein 78 mg. per hundred cubic centimeters. Discharged August 19. Follow-up, Dec. 22, 1941, right hamstring "tightness" on trunk flexion; left shoulder lower than right; slight right dorsal scoliosis.

CASE 3.—J. O., a 6 year old white girl, admitted to the hospital on Aug. 17, 1941 with a two day history of stiff neck, vomiting, fever, loss of appetite and inability to "move the legs" on the day prior to admission, had thick speech, no weakness; biceps reflexes were diminished but equal; the right triceps reflex was absent, the left triceps reflex diminished; ankle jerks and knee jerks more equal and active. A low grade fever continued sporadically for nineteen days. Treatment, bed rest. Spinal fluid, August 17, 160 cells per cubic millimeter; 60 per cent lymphocytes; 40 per cent polymorphonuclears; protein 39 mg. per hundred cubic centimeters. Discharged September 7. Follow-up, left sternomastoid smaller and weaker than right.

CASE 4.—D. N., an 11½ year old white girl, admitted to the hospital on Aug. 22, 1941 with a six day history of fever, headache, stiff neck, vomiting and drowsiness, did not appear acutely ill. There was slight nuchal rigidity, with mild pharyngeal injection, absent right abdominal reflexes and no weakness. There was a low grade fever for one day. Treatment, bed rest. Spinal fluid, August 29, 20 cells per cubic millimeter; 100 per cent monocytes; protein 26 mg. per hundred cubic centimeters. Discharged September 2. Follow-up, Dec. 30, 1941, physical examination negative.

CASE 5.—A. K., a 16 year old white boy admitted to the hospital on Aug. 29, 1941 with a two day history of fever, headache, stiffness of neck and back and nausea, had fever up to 102 F. for three days and persistent neck stiffness. Treatment, bed rest. Spinal fluid, 160 cells per cubic millimeter; 100 per cent monocytes; protein 55 mg. per hundred cubic centimeters. Discharged October 4. Follow-up, Dec. 22, 1941, spasm of right gastrocnemius, left sartorius and left hamstrings; spasm of dorsum of neck.

CASE 6.—D. D. (brother of G. D., patient 22), a 15 year old white boy, admitted on Sept. 5, 1941 with a two day history of fever and headache, had nuchal rigidity and bilateral hypoaffective knee jerks. He had fever the first day. Treatment, bed rest. Spinal fluid, 75 cells per cubic millimeter with 98 per cent monocytes; protein 36 mg. per hundred cubic centimeters. Discharged September 25. Follow-up, Dec. 17, 1941, occasional pain and spasm in right thigh adductors; spasm of hamstrings, dorsum of neck, trapezius, sternomastoids and platysma.

CASE 7.—M. A., a 14 year old white boy, admitted Sept. 21, 1941, the fifteenth day of illness, became ill with sore throat and general malaise, the temperature rising to 102 F. during the first week. There was slight nuchal rigidity. The course was afebrile. Treatment, bed rest; occasional hot packs during the fourth week of illness. Spinal fluid, 25 cells per cubic millimeter; 100 per cent lymphocytes; protein 78 mg. per hundred cubic centimeters. Discharged on October 7. Follow-up, Dec. 22, 1941, patient complained of "occasional tightness" of right hamstrings; left shoulder lower than right; beginning right dorsal scoliosis; mild spasm of hamstrings.

CASE 8.—P. B., a 9 year old white girl, admitted on Aug. 18, 1941 with a three day history of fever, sore throat, vomiting, and pains in both arms and the neck, had a moderately injected pharynx. The temperature rose to 101 F. on the first day. Treatment, bed rest. Spinal fluid, 105 cells per cubic millimeter; 90 per cent monocytes; protein 45 mg. per hundred cubic centimeters. Discharged on August 30. Follow-up, Nov. 5,

1941, absent right knee jerk; spasm of sternomastoids. Dec. 17, 1941, poor posture; slight dorsal curvature to the right on flexion.

CASE 9.—S. R., a 12 year old white girl, admitted on Sept. 18, 1941 with a three day history of headache, dizziness and fever, had nuchal rigidity. There was a low grade fever for three days. Treatment, bed rest. Spinal fluid, 70 cells per cubic millimeter; 95 per cent monocytes; protein 63 mg. per hundred cubic centimeters. Discharged on Oct. 4, 1941. No follow-up.

CASE 10.—R. McC., an 8 year old white girl, admitted on Sept. 25, 1941 with a seven day history of fever, sore throat and stiff neck, had slight nuchal rigidity. The temperature rose to 102 F. for five days. Treatment, bed rest. Spinal fluid, 75 cells per cubic millimeter; 100 per cent monocytes; Pandy test positive. Discharged on Oct. 10, 1941. No follow-up.

BULBAR

CASE 11.—E. S., a 4 year old white girl admitted on Sept. 22, 1941 with a three day history of pains in the arms and legs, general malaise and nasal regurgitation, had been given 35 grains (2.25 Gm.) of sulfadiazine prior to admission. Tonsillectomy had been done fourteen days before onset of the disease. The patient was acutely ill; there was nasal regurgitation; speech was nasal. The temperature was up to 101.6 F. for three days. Treatment was symptomatic as described. Feedings were given by the Levine tube for five days. Spinal fluid, 80 cells per cubic millimeter; 100 per cent monocytes; protein 18 mg. per hundred cubic centimeters. Discharged on Oct. 7, 1941. No follow-up.

CASE 12.—L. F., a 14 year old white girl, admitted on Sept. 17, 1941 with a three day history of nausea, vomiting, dizziness, headache, sore throat and inability to swallow, was acutely ill; there was nuchal rigidity; paralysis of the left palate was present. Speech was nasal. The temperature rose to 102 F. for five days. On the fifth day the respirations gradually became depressed and finally ceased for forty-five seconds. An immediate lumbar puncture was performed and a small amount of spinal fluid removed, not under increased pressure. Caffeine was given. The patient responded and after a twelve hour period the respirations were within normal limits. Left facial paralysis was noted on the ninth day. Nasal speech persisted and was present at the time of discharge. Treatment was symptomatic; feedings were by the Levine tube for four days. Spinal fluid, 140 cells per cubic millimeter; 90 per cent monocytes; protein 68 mg. per hundred cubic centimeters. Discharged on Oct. 8, 1941. No follow-up.

CASE 13.—J. B., a 13 year old white boy, was admitted on Sept. 1, 1941 with a six day history of nausea and vomiting and a three day history of stiff neck and sore throat. There were nuchal rigidity, nasal voice, nasal regurgitation and paralysis of the right palate. The temperature rose to 102 F. for three days. Right facial weakness was noted on the twenty-fifth hospital day. Treatment was symptomatic; feedings were given by the Levine tube for six days. Spinal fluid, 50 cells per cubic millimeter; 100 per cent mononuclears; protein 42 mg. per hundred cubic centimeters. Discharged on September 24. Follow-up, Dec. 22, 1941, nasal speech; weakness of right palate; right lower facial weakness; weakness of both sternomastoids, left weaker than right; substitution noted on neck flexion; weakness of lower abdominal muscles.

CASE 14.—A. H., a 10 year old white boy, was admitted on Aug. 15, 1941 with a two day history of vomiting, headache, stiff neck, nasal speech and difficulty in swallowing. There were slight nuchal rigidity, mild pharyngeal injection, nasal voice, paralysis of the left palate and nasal regurgitation. A low grade fever persisted for three days. Treatment was symptomatic; feedings were given by the Levine tube for four days. Spinal fluid, 38 cells per cubic millimeter; 80 per cent polymorphonuclears; 20 per cent lymphocytes; protein 39 mg. per hundred cubic centimeters. Discharged to convalescent home on September 25. Follow-up, Dec. 17, 1941, revealed that occasional "pins and needles" sensation in both lower extremities associated with weakness and "muscle pain" in right thigh had been noted by the patient. There were weakness of the left palate and slight rotation of the dorsal spine to the left, not notable after exercise.

CASE 15.—Z. M., a 10 year old white boy, admitted on Sept. 10, 1941 with a five day history of headache, fever, pain in the back and nasal regurgitation, had nuchal rigidity, weakness of the right palate and nasal regurgitation. The temperature rose to 101 F. for three days. Treatment was symptomatic. Levine tube feedings were not necessary. Spinal fluid, 170 cells per cubic millimeter; 95 per cent mononuclears; protein 45 mg. per hundred cubic centimeters. Discharged on October 2. Follow-up, Dec. 17, 1941, stuttering had been noted since discharge. The posture was poor; there was weakness of the right palate.

BULBAR WITH NECK WEAKNESS

CASE 16.—E. B., an 11 year old white boy, admitted on Sept. 11, 1941 with a four day history of headache, vomiting, stiff neck, difficulty in swallowing and nasal speech, was acutely ill; right palatal paralysis was present and the gag reflex was absent. Temperature rose to 101.2 F. for four days. Sternomastoid weakness was noted on September 28. Feedings were given by the Levine tube for eight days. Treatment was symptomatic. Spinal fluid, 34 cells per cubic millimeter; 100 per cent monocytes; protein 39 mg. per hundred cubic centimeter. Discharged on Oct. 5, 1941. No follow-up.

BULBAR AND SPINAL

CASE 17.—E. R., a 6½ year old white girl, admitted on Aug. 16, 1941 with a three day history of headache, stiff neck, sore throat and difficulty in speaking, was acutely ill; right palatal weakness, a loud systolic murmur over the entire precordium and some cardiac enlargement were present; there was no difficulty in swallowing. Temperature rose to 102 F. for two days. Weakness of the anterior abdominal muscles had been noted during the last week. Treatment was symptomatic; parenteral fluids were given. Spinal fluid, 70 cells per cubic millimeter; 80 per cent lymphocytes; protein 28 mg. per hundred cubic centimeters. Discharged on Aug. 29, 1941. Follow-up, Dec. 11, 1941, spasm of the back muscles and weakness of the abdominal muscles; patient wearing a surgical corset for weakness of the anterior abdominal muscles.

SPINAL

CASE 18.—L. L., a 7½ year old white boy, admitted on Aug. 13, 1941 with a three day history of stiff neck, fever, constipation and weakness of the right arm, had absent left biceps and both triceps reflexes, weakness of the right biceps and triceps, poor grip and weakness of the interossei. The patient was placed on a Bradford frame with the right arm placed in a Toronto splint; arm removed every four hours for "skin care." There was beginning return of muscle power on September 4. Spinal fluid, 50 cells per cubic millimeter, 75 per cent lymphocytes; protein 32 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 13, 1941. Follow-up, February 1942, limitation of motion at elbow, weakness and atrophy of intrinsic muscles.

CASE 19.—S. S., an 18 month old white boy, admitted on Aug. 23, 1941 with an eight day history of fever, irritability and weakness of the right leg, had flaccid paralysis of the entire right leg with no atrophy or muscle tenderness. The course was afebrile. A plaster cast was applied to the right leg on August 27. Spinal fluid, 80 cells per cubic millimeter; 95 per cent lymphocytes; protein 18.8 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital Sept. 22, 1941. Follow-up, February 1942, good cosmetic result; fair return of function.

CASE 20.—M. R., a 3½ year old white boy, admitted on Aug. 18, 1941 with an eight day history of headache, stiff neck, irritability, fever and weakness of the right leg, had paralysis of the right leg and weakness of the left leg. Temperature rose to 100.4 F. daily for three and one-half weeks. Treatment, casts applied to both legs. Lumbar puncture was not done. Transferred to Orthopedic Hospital on Sept. 1, 1941. Follow-up, March 1942, atrophy of the right leg; shortening of the Achilles tendon on the right; muscle power good; left leg normal.

CASE 21.—M. McL., a 17 year old white youth, admitted on Aug. 26, 1941 with a three day history of fever and stiffness of the neck and back, had nuchal rigidity, weakness of both quadriceps and both peroneal groups, weakness of the right thigh adductors and abductors and complete paralysis of the right

hamstrings; he was unable to lift either leg off the bed. Temperature rose to 103.2 F. for one week. Casts were applied to both legs. Spinal fluid, 42 cells per cubic millimeter; 50 per cent mononuclears; protein 83 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 20, 1941. Follow-up, March 1942, limitation of motion at the right knee and right hamstring contracture.

CASE 22.—G. D. (brother of D. D., patient 6), a 3 year old white boy, admitted on Aug. 28, 1941 with an eight day history of fever, pain in the back of neck and weakness of the right foot, had paralysis of the right lower leg. Temperature occasionally rose to 100.2 F. during the first two weeks. The patient was placed on a Bradford frame and the right leg placed in a Toronto splint. Spinal fluid, 72 cells per cubic millimeter; 70 per cent lymphocytes; protein 62 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital Sept. 26, 1941. Follow-up, March 1942, moderate atrophy of the right lower leg; shortening of the right achilles tendon.

CASE 23.—E. A. B., a 6 year old white girl, admitted on Aug. 28, 1941 with a three day history of vomiting, fever, headache and weakness of the left arm, had paralysis of the left deltoid, weakness of the upper trapezius, biceps and triceps, poor grip and inability to flex the head. Temperature rose to 103 F. for two days. The patient was able to lift the head on September 16. Treatment, Bradford frame; left arm in a Toronto splint. Spinal fluid, 160 cells per cubic millimeter; 100 per cent lymphocytes; protein 35 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 26, 1941. No follow-up.

CASE 24.—L. C., a 3 year old white girl, admitted Aug. 8, 1941 with a six day history of fever, irritability, numbness and finally paralysis of the left arm, had weakness of the entire left arm with slight power in the hand and fingers. There was improvement in the power of the grip during the hospital stay. Treatment, Bradford frame; Toronto splint to the left arm. Spinal fluid, 170 cells per cubic millimeter; 80 per cent mononuclears; protein 43 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 12, 1941. Follow-up, March 1942, limitation of motion at the elbow; power of muscles returning; gross substitution in abducting arm.

CASE 25.—A. B., an 8 year old Negro boy, admitted on Aug. 14, 1941 with a three day history of headache, abdominal pain and inability to walk on the right leg, had nuchal rigidity and complete paralysis of the right leg. Temperature occasionally rose to 100 F. Treatment, Bradford frame; right leg in a Toronto splint. Spinal fluid, 165 cells per cubic millimeter; 95 per cent monocytes; protein 47 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital Sept. 17, 1941. Follow-up, March 1942, limitation of motion at knee; atrophy of thigh and calf muscles; function poor; supports weight with decided limp.

CASE 26.—V. C., a 5 year old white boy, admitted on Aug. 16, 1941 with a five day history of pain, fever, vomiting and paralysis of the right arm, had complete paralysis of the right arm and shoulder, weakness of the entire left arm and shoulder, nuchal rigidity and inability to flex the neck. The course was afebrile. The patient was irritable until casts were applied. Treatment, cast applied which covered neck, both arms and trunk. Spinal fluid, 80 cells per cubic millimeter; 80 per cent lymphocytes; protein 29 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 23, 1941. Follow-up, March 1942, left upper extremity: atrophy, deltoid function fair, substitution with upper trapezius; right upper extremity: considerable atrophy, very slight deltoid function, flexion contractions of fingers, vascular changes in hand.

CASE 27.—Y. D., a 3½ year old white girl, admitted on Aug. 2, 1941 with a six day history of "sore throat," fever, weakness, inability to lift the left arm and pain in the abdomen, had complete paralysis of the left upper arm and forearm muscles and weakness of the left hand. Weakness of the right arm and neck developed during the first week of hospitalization. Temperature rose to 101 F. for three days and to 100.4 F. nightly for three weeks. The patient was placed on a Bradford frame with Toronto splints applied to both arms. Spinal fluid, 110 cells per cubic millimeter; 98 per cent monocytes; protein

73 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 25, 1941. Follow-up, February 1942, right arm essentially normal; poor cosmetic result of left hand, with some vascular disturbance; scapular rotation during abduction of arm; function poor; substitution noted.

CASE 28.—H. P., a 5 year old white girl, admitted on Aug. 21, 1941 with a five day history of "limping on right foot" and vomiting, had paralysis of the right iliopsoas and quadriceps and "tightness" of the right hamstrings and paralysis of the dorsiflexors. The course was afebrile. A cast was applied to the right leg. Spinal fluid, 60 cells per cubic millimeter; 100 per cent monocytes; protein 30 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Oct. 2, 1941. Follow-up, February 1942, abduction limp, shortening of the right hamstrings.

CASE 29.—H. M., a 16 year old white youth, admitted on Aug. 26, 1941 with a four day history of headache, stiff neck, weakness of both legs and inability to void, was acutely ill and had nuchal rigidity. Both legs were paralyzed completely and the bladder was distended. A retention catheter was applied from day of admission to September 6. Sulfathiazole was given in average doses to prevent possible urinary infection, and discontinued after twenty-four hours because of gross hematuria. Casts were applied to both legs. Spinal fluid, 200 cells per cubic millimeter; 100 per cent monocytes; Pandy test positive. Transferred to Orthopedic Hospital on Oct. 3, 1941. Follow-up, February 1942, quadriiceps shortening; limitation of motion at knee; function poor.

CASE 30.—A. T. (brother of F. T., patient 31), an 8 month old white boy, admitted on Aug. 16, 1941 with a five day history of fever, irritability and "paralysis" of the left leg, was pale, malnourished and had left "foot drop" and nuchal rigidity. The course was afebrile. There was a progressive weight gain. A cast was applied to the left leg. Spinal fluid, 22 cells per cubic millimeter; 100 per cent monocytes; protein, 114 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Oct. 3, 1941. Follow-up, March 1942, considerable atrophy; left achilles contracture; shortening of the left hamstrings.

CASE 31.—F. T. (brother of A. T., patient 30, with significant family history: three siblings have a muscular dystrophy), a 3 year old white boy, admitted on Aug. 12, 1941 with a four day history of fever, weakness of the right leg and "incontinent of feces," whose calf muscles had been getting large during the year prior to admission but no weakness had been observed before present illness, was acutely ill and was unable to void. Nuchal rigidity and paralysis of the right leg were present. Bladder function returned one week after admission. Temperature rose to 101 F. for three days. Treatment, catheterization; Toronto splint applied for nineteen days, then cast was applied. Spinal fluid, 85 cells per cubic millimeter; 95 per cent monocytes; protein 34 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Oct. 10, 1941. No follow-up.

CASE 32.—H. T., a 17 year old white youth, with an eleven day history of nausea, vomiting, diarrhea, fever, headache and stiff neck, had been admitted to a local hospital on Aug. 18, 1941 and transferred to Willard Parker Hospital on August 21 when pain and paralysis of the lower extremities developed. Nuchal rigidity, bilateral spasm of the hamstrings and paralysis of both lower extremities were present. On August 24 respirations became shallow and labored, owing to diaphragmatic paralysis and intercostal weakness. On September 1 the intercostals were also paralyzed, as were the abdominal muscles. Loss of weight was rapid and the patient remained cachectic during the entire hospital stay. He was placed in a respirator on August 24 and was there continuously until September 26, when he was able to remain out of the respirator for thirty minutes to one hour at a time. During this period the patient's course was "stormy." Mucus accumulated in the pharynx, which the patient was unable to cough up. Frequent bouts of vomiting and abdominal pain occurred. On two occasions the patient appeared moribund and while in the respirator became cyanotic.

On October 15 hot packs were started to the entire body but given more frequently to the chest and abdomen. One week later, chest excursion was increased. At the onset of this

treatment the patient was "rigid" and could not be moved without pain. A gradual improvement in comfort and outlook was noted. During the first week in December, when some relaxation had been accomplished, an attempt at complete evaluation of the muscles showed complete paralysis of both lower extremities with the exception of the right sartorius and iliopsoas and left plantar flexors of the toes. The diaphragm and abdominal muscles were paralyzed. Chest excursion was greater on the left side than on the right. Accessory muscles of the neck and shoulders were used with each respiration. Muscles of the left upper extremity were good and those of the right fair. Contractures were noted throughout the entire body, so that passive motion to any degree was not possible. On December 20 the patient was removed from the respirator.

Examination of the spinal fluid showed 127 cells per cubic millimeter; 78 per cent polymorphonuclears; 22 per cent lymphocytes; protein 46.3 mg. per hundred cubic centimeters.

The patient was transferred to the Orthopedic Hospital on Jan. 20, 1942.

A follow-up examination was made in March 1942. Some weight gain was noted. The patient was able to roll over in bed. Accessory muscles of respiration were not used as extensively when the patient was at rest. Passive motion could be carried out to a greater degree. There was no pain. Atrophy was extreme. There was considerable shortening of the thigh adductors, hamstrings and pectoral muscles.

N. B.: This case is not included with those in which the Kenny treatment was given because until further relaxation takes place the necessary passive exercises and reeducation cannot be carried out.

CASE 33.—M. M., a 7 year old white boy, admitted on Sept. 15, 1941 with a five day history of sore throat, fever, pain and weakness of the right arm, was acutely ill, with nuchal rigidity, weakness of the right biceps, pectoralis, and intrinsic hand muscles. Temperature rose to 101.8 F. for five days. The patient was placed on a Bradford frame and a Toronto splint was applied. Spinal fluid, 110 cells per cubic millimeter; 55 per cent monocytes; Pandy test plus 1. Transferred to a private physician on Oct. 9, 1941. No follow-up.

CASE 34.—V. S., an 8 year old white boy, admitted on Sept. 26, 1941 with an eight day history of pains in both legs and lower part of the back, had extreme weakness of all muscles of both lower extremities. The course was afebrile. Hot pads were started on September 27; no passive exercises or reeducation. Spinal fluid, 6 cells per cubic millimeter (monocytes); protein 61 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital Oct. 6, 1941. No follow-up.

CASE 35.—H. P., a 5 year old white boy, admitted on Sept. 12, 1941 with a two day history of fever, abdominal pain and weakness of the left leg, had nuchal rigidity, paralysis of the left quadriceps and left iliopsoas and weakness of all other groups of muscles of the left leg. The course was afebrile. Treatment, Toronto splint applied. Spinal fluid, 125 cells per cubic millimeter; 95 per cent monocytes; protein, Pandy test plus 1. Transferred to Orthopedic Hospital on Sept. 25, 1941. Follow-up in March 1942 revealed considerable atrophy of the left thigh; limitation of motion at the left knee; slight right scoliosis; "tipped pelvis."

CASE 36.—D. F., a 14 year old white youth, admitted with a seven day history of nausea, vomiting, fever, stiff neck and weakness of the left leg, had nuchal rigidity, weakness of all four extremities and a slight diminution of chest excursion. The course was afebrile. Intercoastal weakness was improved. Treatment, Bradford frame; both arms and both legs in Toronto splints. The spinal fluid report is not available. Transferred to private physician on Sept. 23, 1941. No follow-up.

CASE 37.—H. J., a 13 year old white youth, admitted on Aug. 22, 1941 with an eight day history of fever and pain in the legs and a one day history of paralysis of both legs and inability to void, was acutely ill, with nuchal rigidity, complete paralysis of both legs and a distended bladder. Bladder function returned after one week; the course was afebrile. Treatment, retention catheter in place for one week; sulfathiazole to prevent possible bladder infection; discontinued after twenty-four hours because of hematuria; Toronto splint to both legs. Spinal fluid, 103

cells per cubic millimeter; 50 per cent lymphocytes; protein 19.2 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 22, 1941. No follow-up.

CASE 38.—P. E., a 20 month old white girl, admitted on Aug. 13, 1941 with a five day history of sore throat, fever irritability, inability to stand and weakness of the left arm, was acutely ill, with weakness of the left arm and paralysis of both legs. Temperature rose to 100.4 F. daily for four weeks. At time of discharge, there was some return of function of the left forearm and limitation of passive motion at both knees. Treatment, Bradford frame; Toronto splints to both legs and left arm. Spinal fluid, 25 cells per cubic millimeter; 100 per cent monocytes; protein 58 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital Sept. 10, 1941. No follow-up.

CASE 39.—N. K., a 7 year old white girl, admitted on Sept. 10, 1941 with a two day history of inability to move the left leg, had slight nuchal rigidity, paralysis of the entire left leg including the gluteal muscles and weakness of the right leg. Temperature rose to 101 F. for three days. Treatment, Toronto splints to both legs. Spinal fluid, 165 cells per cubic millimeter; 98 per cent monocytes; protein 92 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 29, 1941. No follow-up.

CASE 40.—J. D., a 2 year old white girl admitted on Sept. 6, 1941 with an eight day history of fever, diarrhea, anorexia, listlessness and weakness of the right arm, was irritable and had paralysis of the right biceps, triceps and deltoid. Temperature rose to 101 F. for two days. There was some return of triceps and biceps function. Treatment, Bradford frame; Toronto splint to the right arm. Spinal fluid, 70 cells per cubic millimeter; 75 per cent monocytes; protein 22 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 25, 1941. No follow-up.

CASE 41.—J. K., a 4 year old white boy, admitted on Sept. 4, 1941 with a four day history of pain in the right leg, headache and nausea, had nuchal rigidity, moderate pharyngeal infection and paralysis of the right leg. The course was afebrile. Treatment, Toronto splint to the right leg. Spinal fluid, 126 cells per cubic millimeter; 100 per cent monocytes; protein 30 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 24, 1941. Follow-up in March 1942 revealed paralysis of right quadriceps; shortening of the right hamstrings; contracture of the right achilles tendon.

CASE 42.—P. D., a 3 year old white boy, admitted on Sept. 8, 1941 with a three day history of fever, anorexia, stiff neck, vomiting and weakness of the right leg, had paralysis of the right leg. Temperature rose to 100.8 F. for four days. Treatment, Toronto splint to the right leg. Spinal fluid, traumatic tap. Transferred to Orthopedic Hospital on Sept. 29, 1941. No follow-up.

CASE 43.—M. S., a 28 year old white woman, admitted on Aug. 31, 1941 with a six day history of anorexia, diarrhea, pain in both thighs and finally inability to stand, had nuchal rigidity, paralysis of both lower extremities and weakness of both deltoids. The patient was very obese. Temperature rose to 101 F. for four days. All extremities were placed in the ventral position and a low caloric diet was given. Spinal fluid, 300 cells per cubic millimeter; 100 per cent monocytes; protein 94 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Sept. 22, 1941. Follow-up in March 1942 revealed practically no function in muscles of lower extremities; limitation of motion at knee and ankle joints due to contractures.

KENNY TREATMENT NONPARALYTIC

CASE 44.—I. S., an 11 year old white girl, admitted on Oct. 17, 1941 with a seven day history of fever, nausea, dizziness and stiffness of the neck and back, had been given sulfathiazole prior to admission for four days. She was moderately ill. There was spasm of the dorsum of the neck, back and hamstrings. Temperature rose to 103 F. for one week. Disappearance of spasticity occurred within ten days. Hot packs were applied to the entire back from the head to the heels from October 19 to October 30. Spinal fluid, 245 cells per cubic millimeter; 95 per cent monocytes; protein 40 mg. per hundred cubic centimeters. Discharged on November 1. Follow-up,

December 1941, "occasional cramps" in hamstrings and occasional back pain; no spasm noted on physical examination and no scoliosis.

CASE 45.—M. V., a 22 year old white woman, admitted on Sept. 23, 1941 with an eight day history of sore throat, headache and a one day history of stiffness of the neck, had a mild pharyngeal infection, with spasm of the dorsum of the neck and hamstrings. Spasm was relieved after seven days. Hot packs were applied to the dorsum of the neck and hamstrings from September 29 to October 7. Spinal fluid, 245 cells per cubic millimeter; 100 per cent monocytes; protein 37 mg. per hundred cubic centimeters. Discharged on Oct. 8, 1941. No follow-up.

BULBAR WITH NECK WEAKNESS

CASE 46.—W. K., a 7 year old white boy, admitted on Aug. 8, 1941 with a three day history of vomiting, inability to swallow, nasal regurgitation and pain and stiffness of the neck and back, was acutely ill and had nasal speech, nasal regurgitation, nuchal rigidity, inability to lift the head, and left palatal and left facial weakness. The temperature was up to 102 F. for four days. Feedings were given by the Levine tube for six days. The patient attempted to lift his head with pronounced substituting with the shoulders and platysma. The corners of the mouth were drawn downward. The sternomastoids were "thin bands." After three weeks of Kenny treatment, contractions were felt in the sternomastoids during passive movements. The sternomastoids gradually increased in size. Strength of contractions continued to improve but substitution persisted. Treatment was bulbar: symptomatic; Kenny treatment was started on September 23. Spinal fluid, 95 cells per cubic millimeter; 95 per cent monocytes; protein 73 mg. per hundred cubic centimeters. Follow-up, January 1942, function good; atrophy slight; substitution present.

CASE 47.—F. F., an 11 year old white girl, admitted on Aug. 21, 1941 with a three day history of fever, nausea, vomiting, nasal regurgitation and nasal speech, was critically ill and toxic; there was paralysis of the left palate and both sternomastoids. The patient's condition remained critical during the first week, with pronounced lethargy and fever up to 103 F. There was rather rapid improvement in the second week. Neck flexion was done with substitution, with the shoulders and platysma. Both sternomastoids showed atrophy, the left more than the right. Spasm of the hamstrings was noted on September 23. The Levine tube was used for six days. Hot packs were applied to the dorsum of the neck and hamstrings from September 27. Passive motion and reeducation were started on September 28. Spinal fluid, 160 cells per cubic millimeter; 95 per cent monocytes; protein 100 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 12. Kenny treatment continued. Follow-up, February 1942, function good; moderate atrophy in left sternomastoid; very slight amount of substitution.

CASE 48.—J. B., a 6 year old white boy, admitted on Oct. 7, 1941 with a four day history of headache, fever, nasal regurgitation and difficulty in breathing, was moderately ill; there was occasional nasal regurgitation; on October 11, weakness of the right palate and left sternomastoid. The temperature rose to 101 F. for four days. The patient was able to take fluids by mouth in small amounts. Improvement in sternomastoid function was noted during the first month. Hot packs, passive movements and reeducation were started on October 13. Discharged on November 8 with good function of both sternomastoids; no atrophy. Follow-up, Dec. 17, 1941, strength of sternomastoids unchanged; very slight spasm of the dorsum of the neck and the upper trapezius. The patient was referred to the orthopedic clinic for further care.

CASE 49.—G. T., a 4 year old white boy, admitted on Nov. 20, 1941 with a four day history of fever, sore throat, cough, hoarseness and difficulty in breathing, was acutely ill, with pronounced nuchal rigidity, nasal regurgitation and nasal speech, a large amount of mucus accumulated in the pharynx, occasional cyanosis, and left palatal weakness. Neck weakness on admission could not be evaluated. A bilateral purulent otitis media (hemolytic *Staphylococcus aureus*) developed on December 4. There was bilateral sternomastoid weakness, marked spasm of the dorsum of the neck and moderate hamstring spasm on Decem-

ber 2. During the third week in December, relaxation of the dorsum of the neck and hamstrings had been accomplished. Substitution—"cupping of the shoulders"—was noted. Voluntary contractions in the sternomastoids were noted in the first week in January. Movements were coordinated. Feedings were by the Levine tube for eighteen days. Hot packs were started on November 30. Passive motion and reeducation were started on December 2. Spinal fluid, 50 cells per cubic millimeter; 98 per cent monocytes; protein 56 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on January 19. Follow-up in February 1942 revealed continued improvement in strength of the sternomastoids; no atrophy and no substitution.

CASE 50.—R. O'D., a 22 year old white woman, admitted on Dec. 28, 1941 with a three day history of nausea, vomiting, stiff neck and nasal regurgitation, was acutely ill. The temperature was 104 F. There was a large accumulation of mucus in the pharynx, nasal regurgitation, spasm of the dorsum of the neck and right palatal weakness. Feedings were given by the Levine tube for five days. Pronounced incoordination on attempting neck flexion was noted soon after admission. The patient was always capable of sternomastoid contraction. Spasm of the dorsum of the neck subsided and recurred during the first week. Spontaneous painful contractions of the hamstrings were noted by the patient. Neck coordination improved rapidly, after relaxation of the dorsum of the neck during the third week. Kenny treatment was started on January 1. The patient was transferred to the Orthopedic Hospital on January 29. Follow-up in January 1942 revealed continued improvement; no atrophy; no substitution; nasal speech.

BULBAR AND SPINAL

CASE 51.—R. G., an 8 year old white girl, admitted on Sept. 7, 1941 with a seven day history of sore throat, fever, stiff neck, inability to swallow, incontinence of urine and nasal regurgitation, was dehydrated and critically ill; the temperature was 104 F. Nasal regurgitation, nasal speech and inability to flex the neck were observed. During the first five days the patient continued to appear critically ill. The temperature rose to 104 F. for five days. Feedings by the Levine tube and parenteral administration of fluids were given for five days. On September 15 the patient was able to flex the neck, but this action was performed awkwardly. The patient seemed unable to initiate the movement and would throw her head forward. After two weeks of Kenny treatment, smooth flexion of the neck was noted. Slight weakness of the abdominal muscles and loss of the normal lumbar curve were noted on October 17. Beginning left scoliosis was noted on November 12. Active left lateral trunk flexion was limited on December 9. The Kenny treatment was again instituted on December 10. The spinal fluid report was not available. The patient was transferred to the Orthopedic Hospital on December 12. Follow-up in January 1942 revealed improvement in the abdominal and back muscles; disappearance of scoliosis; neck function good.

CASE 52.—N. G., a 10 year old white girl, admitted on Sept. 21, 1941 with a three day history of fever, stiff neck, drowsiness and difficulty in raising the head, had nuchal rigidity, thick speech, inability to raise the head, hamstring spasm and minimal weakness of the left palate. On September 8 there was paralysis of the right dorsiflexors of the foot. The temperature rose to 103 F. for four days. Nasal regurgitation occurred once on the second hospital day. Hot packs to the entire back were started on October 1 and reeducation two days later. Spasm of the neck, back and hamstrings responded during treatment. Spasm of the right gastrocnemius was persistent so that more frequent packs were used during the last week in the hospital. At the time of discharge, function and power had returned to the sternomastoid. Slight substitution was noted. There was no atrophy. Function and power returned in the right peroneal group and beginning return of function in the right anterior tibial. Spinal fluid, 130 cells per cubic millimeter; 95 per cent monocytes; protein 52 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 12. Follow-up, February 1942, neck flexion normal; continued improvement in dorsiflexion of the right foot with continued relaxation of the right gastrocnemius spasm.

CASE 53.—H. R., a 10 year old white boy, admitted on Sept. 18, 1941 with a two day history of "generalized aches and pains," vomiting, difficulty in swallowing, nasal regurgitation, abdominal pains and fever, had deviation of the tongue to left, right facial paralysis (peripheral type) and inability to cough or swallow. The temperature rose to 101 F. for three days. Parenteral fluids were given. Feedings were given by the Levine tube for twelve days. On September 22 weakness of the sternomastoids was noted and on September 25 paralysis of the entire left deltoid, biceps, triceps and forearm muscles. Kenny treatment was started on September 25. Contractions were felt in the deltoid during passive movements after one month. Function of triceps, biceps and forearm muscles returned during the first three weeks. At discharge there was weakness of the left deltoid and left triceps with spasm of the left upper trapezius noted during passive exercises. Spinal fluid, 105 cells per cubic millimeter; 75 per cent monocytes; protein 51 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on November 26. Follow-up in February 1942 revealed complete range of motion of the left arm with slight weakness of the left deltoid; residual right facial weakness; no atrophy.

CASE 54.—B. F., a 13 year old white girl, admitted on Sept. 26, 1941 with a four day history of fever, headache, pain in the back, nausea, epigastric pain, nasal regurgitation and weakness of the left arm, appeared moderately ill. Examination revealed left palatal weakness, spasm of the dorsum of the neck and back and hamstrings, nasal voice, weakness of the left triceps, biceps and forearm muscles, paralysis of the left deltoid and spasm of the left suprascapular group. The head was held toward the left. No nasal regurgitation was noted. Kenny treatment was started on September 26. Recurrent spasm of the left pectorals, upper trapezius and latissimus dorsi and both hamstrings occurred. There were incoordination and substitution on attempting left arm abduction. Contractions of the deltoid were felt during passive exercises after three weeks. Spasm of the left pectoral muscles responded to treatment after two months. On November 28 spasm of the erector spinae group on the left occurred, giving a beginning right lumbar scoliosis. Treatment for this was started immediately. Spinal fluid, 160 cells per cubic millimeter; 80 per cent monocytes; protein 74 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 12. Follow-up in March 1942 revealed good deltoid function, no limitation of motion; very slight atrophy of left shoulder.

SPINAL

CASE 55.—J. M., a 19 year old white youth, admitted on Sept. 10, 1941 with a six day history of pain in the back of the neck, vomiting, fever, weakness of the left arm and dyspnea, was moderately dyspneic. Examination revealed no cyanosis, cough good, no intercostal function, diaphragmatic action weak and irregular, ballooning of the upper abdomen with each expiration and weakness of both upper extremities. Both arms were placed in Toronto splints from September 10 to 28. The patient exhibited marked discomfort while in splints. On September 28 spasm was noted in both pectorals, left latissimus dorsi, left biceps, back and both hamstrings. There was weakness of the pectoral muscles and left biceps. Kenny treatment was started on September 28. Two weeks later pectoral spasm had been partially released and intercostal function returned. There was paralysis of the left serratus anterior with winged scapula. At the time of discharge there was fair function in the left deltoid. Passive abduction of the left arm was possible without substitution or spasm through 90 degrees; the right deltoid was normal. Winging of the scapula was less prominent, and there was less ballooning of the upper abdomen. Hamstring and back spasm had subsided. Spinal fluid, 85 cells per cubic millimeter; 100 per cent monocytes; protein 52 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 15. Follow-up in January 1942 revealed winging of the left scapula much improved; ballooning of the upper abdomen less prominent; spasm of the left pectorals minimal; left deltoid function good.

CASE 56.—C. S., an 8 year old white girl, was admitted on Sept. 9, 1941 with a five day history of diarrhea, fever, headache, abdominal pain, stiff neck and weakness of the right arm. The

patient was afebrile. There were weakness of both arms and inability to flex the neck. Toronto splints were applied to both arms for three weeks. Kenny treatment was started September 27. The patient was very uncomfortable in Toronto splints. The arms were normal after one and one-half months but initiating of neck flexion was not possible. The patient frequently forgot from day to day how sternomastoid action was performed. At the time of discharge, slight substitution was noted during neck flexion. Spinal fluid, 125 cells per cubic millimeter; 100 per cent monocytes; protein 40 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 13. Follow-up in February 1942 revealed minimal weakness of the sternomastoids as tested against force; no atrophy; minimal substitution.

CASE 57.—C. O., a 9 year old white girl, admitted on Oct. 4, 1941 with a seven day history of fever, vomiting, constipation and pain in the right leg, was unable to extend the right leg on the day before admission. Examination revealed spasm of both hamstrings (right greater than left), spasm of the right gastrocnemius, weakness of the right quadriceps, dorsiflexors of the foot and gluteal muscles and spasm of the right quadratus lumborum and erector spinae group with marked scoliosis. The patient was unable to contract the left quadratus lumborum. The temperature rose to 100.2 F. for two weeks. Kenny treatment was started on admission. Scoliosis was not apparent after two weeks. Function of the right dorsiflexors returned during the first week and beginning return of right quadriceps function in the third week. Hamstring spasm persisted until the second month. At discharge there was complete range of passive motion, right quadriceps poor. Spinal fluid, 5 cells per cubic millimeter; 100 per cent monocytes; protein 55 mg. per hundred cubic centimeters. The patient was transferred to the Orthopedic Hospital on December 13. Follow-up in January 1942 revealed the right quadriceps improving in power; no atrophy, no substitution.

CASE 58.—V. C., a 13 year old white boy, admitted on Sept. 9, 1941 with a two day history of headache, fever and pain in the legs, knees and back, had slight weakness of both quadriceps and the right abductors of the thigh, and spasm of the neck, back and hamstrings. The temperature rose to 102 F. for four days. Both legs were placed in Toronto splints. Analgesics and sedatives were given. Right purulent otitis media was present during the first week. Splints were removed on September 22. Muscle power was good. Spasm persisted so that the patient was unable to sit up in bed. Kenny treatment was started on September 27. Hot baths were given two to three times a day in addition to packs from October 20. Slow relaxation of spasm was noted. At the time of discharge the patient had spasm of the back muscles. Spinal fluid, 180 cells per cubic millimeter; 100 per cent monocytes; protein 99 mg. per hundred cubic centimeters. Discharged on November 1. Follow-up in January 1942: Hot baths were continued at home; occasional "cramps" in the hamstrings; difficulty in climbing stairs; beginning right dorsal scoliosis. The patient was referred to the orthopedic clinic.

CASE 59.—M. K., a 19 year old white youth, admitted on Oct. 24, 1941 with a four day history of fever, stiff neck and weakness of the right leg, had spasm of the neck, back and hamstrings and minimal weakness of the right thigh muscles. Kenny treatment was started on admission. Spasm started to relax after two weeks. No weakness was detected at the end of one month. On discharge slight spasm continued in the back and hamstrings. Spinal fluid, 100 cells per cubic millimeter. The patient was transferred to the Orthopedic Hospital on December 13. Follow-up in February 1942 revealed that the back and shoulders were held somewhat stiffly in walking; slight persistent spasm of the back and hamstrings.

CASE 60.—F. F., an 8 months old white boy, admitted on Oct. 31, 1941 with a nine day history of fever, vomiting, constipation, stiff neck, "limpness" of the right leg and inability to sit up, had spasm of the dorsum of the neck and back and weakness of the right quadriceps and right hamstrings. The patient was afebrile. Kenny treatment was started on admission. Relaxation of spasm occurred during the first three weeks. At the time of discharge, the patient was again able to sit up. There was minimal weakness of the right lateral hamstrings. The right quadriceps was normal. Spinal fluid, 40 cells per cubic milli-

meter; 95 per cent monocytes; protein 67 mg. per hundred cubic centimeters. Discharged on Dec. 19, 1941. To be followed in the orthopedic clinic, no further follow up.

CASE 61.—K. Z., a 3 year old white boy, admitted on Oct. 7, 1941 with an eleven day history of sore throat, fever up to 105 F., pain in the neck, back and knees and weakness of the legs, had had epileptiform convulsions since infancy three to four times a year and speech defect. The child was critically ill and lethargic, with weakness of both legs. Examination one week after admission revealed paralysis of the abdominals and both quadriceps, weakness of other muscle groups of both lower extremities, poor neck flexion and irregularity in intercostal function. Spasm of the back and hamstrings was pronounced. Kenny treatment was started on admission. Spasm of the adductors and hamstrings was very persistent. Constipation was severe. Intercostal function was good after the second week. On discharge there were moderate weakness of the lower extremities and sternomastoids, paralysis of the abdominal muscles and persistent spasm of the dorsum of the neck, back and hamstrings. Spinal fluid, 57 cells per cubic millimeter; 100 per cent lymphocytes; Pandey test negative. The patient was transferred to Orthopedic Hospital on December 15. Follow-up in January 1942 revealed beginning contractions in the abdominal muscles during passive movements; persistent spasm of the back and hamstrings; neck flexion well performed; muscles of both lower extremities showed returning function.

CASE 62.—J. W., a 7 year old white boy, was admitted on Oct. 2, 1941 with a history of headache, fever, stiff neck, vomiting and abdominal pain. These symptoms subsided and on the seventh day the patient was allowed out of bed. At that time weakness of the left foot was noted. There was spasm of the left hamstrings and left gastrocnemius, with shortening of the achilles tendon. Contractions were felt in the dorsiflexors of the foot on active movements. Severe spasm persisted for one month. There was some limitation on motion on passive dorsiflexion. At discharge dorsiflexion was poor. Spinal fluid, 65 cells per cubic millimeter; 98 per cent monocytes; protein 34 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Dec. 15, 1941. Follow-up in January 1942 revealed continued improvement in dorsiflexion of the left foot and continued relaxation of spasm of the left gastrocnemius.

CASE 63.—M. J., a 12 year old white boy, admitted on Sept. 22, 1941 with a five days history of general malaise, anorexia, chills and fever and a two day history of inability to raise the right arm, had had since birth multiple hemangiomas of the right arm and shoulder and had received numerous sclerosing injections. On Aug. 24, 1941 excision of the right pectoral hemangiomas was performed. Coincident with the fourth day of the present illness, the patient had a secondary hemorrhage at the operative site. The right arm was tender and swollen, with many ecchymotic areas. Numerous nodules palpated along the course of the blood vessels. From the operative wound on the right side of the chest exuded serosanguineous material. (The patient had been admitted at the onset of the present illness to the hospital at which the operation had been performed. At that hospital the operative wound was opened and cultures taken which were found to be negative.) There were paralysis of the right deltoid and weakness of the biceps, triceps and forearm muscles. The blood pressure was 150/100 (both arms).

Complete bed rest was carried out with the arm on a pillow and the elbow flexed to an angle of 110 degrees for five weeks. Kenny treatment was started during the fifth week. Continued hemorrhage necessitated absolute immobilization. By the fortieth day, the operative wound had healed. At that time there was noted a biceps contracture, contracture of the forearm flexors and atrophy of the deltoid and shoulder girdle. The contracted biceps muscle was weaker than the triceps. After one month of the Kenny treatment extension of the forearm increased from 110 to about 160 degrees. All groups improved but the deltoid, which remained paralyzed. Hypertension was present at the time of discharge. Blood chemistry was normal and urinalysis was negative. Spinal fluid, 100 cells per cubic millimeter; 100 per cent lymphocytes; protein 80 mg. per hundred cubic centimeters. The patient was transferred to the urologic ward of a general hospital on Dec. 10, 1941 because of a suspicious pathologic condition revealed on an intravenous pyelo-

gram. Follow-up revealed that the blood pressure had returned to normal during the third month after onset of the disease. No kidney disorder was found. The patient was being followed at the orthopedic clinic. Further follow-up was not available.

CASE 64.—L. A., a 2 year old white boy, admitted on Nov. 2, 1941 with a seven day history of fever, chills, stiff neck and paralysis of the left lower extremity, had spasm of the dorsum of the neck and back and flaccidity of the left lower extremity. The Kenny treatment was given from admission. (Varicella developed on November 27 and was associated with cervical adenitis.) Relaxation was noted at the end of the second week. All muscle groups showed a slow return of function. Spasm of the right iliotibial band was noted during the first week and remained "tight" until the end of the first month. At the time of discharge muscle power in the left hamstrings, thigh adductors, abductors and flexors was fair and poor in the quadriceps, gastrocnemius and dorsiflexors of the foot. Spinal fluid, 30 cells per cubic millimeter; 100 per cent monocytes; protein 40 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Jan. 19, 1942. Follow-up in February 1942 revealed slow improvement; there was no spasm, no contracture and no atrophy.

CASE 65.—A. C., a 2 year old white girl, admitted on Oct. 20, 1941 with a four day history of fever, listlessness, vomiting and weakness of the left foot, was afebrile and irritable and had weakness of the left quadriceps, gastrocnemius and gluteal muscles and paralysis of the dorsiflexors of the left foot and toes. Kenny treatment was started on admission. There was a return in all groups after one week. She stood well at one month and at the time of discharge her gait was normal. Spinal fluid, 65 cells per cubic millimeter; 100 per cent monocytes; protein 52 mg. per hundred cubic centimeters. Discharged on Dec. 19, 1941. Further follow-up was not available.

CASE 66.—R. B., an 8 year old white boy admitted on Oct. 17, 1941 with a seven day history of sore throat, fever, pain and stiffness of the neck and back and weakness of both legs, was critically ill, anxious and perspiring freely. Extreme weakness of both lower extremities, irregular chest excursion and slight weakness of both arms were present. Kenny treatment was started on admission. Frequent packs were applied to the pectorals. During the first two days the patient's condition became worse. Respirations dropped to 12 per minute and remained there for more than eighteen hours. During this period there was complete intercostal paralysis. At the end of the first week intercostal action had returned. This was coincident with the beginning of relaxation of the severe pectoral spasm. Spasm was also severe in the hamstrings and adductors of the thigh and back. Right abdominal muscles were completely paralyzed and those on the left were weak. There was constipation. At discharge all groups had some return of function but spasm of the hamstrings and back was still present. The intercostals were normal. Spinal fluid, 40 cells per cubic millimeter; 100 per cent lymphocytes; globulin negative. Transferred to Orthopedic Hospital on Dec. 12, 1941. Follow-up in February 1942 revealed continued improvement in all groups; right abdominals had beginning contractures on passive motion; spasm of back was persistent.

CASE 67.—J. L., a 6 year old white girl admitted on Oct. 22, 1941 with a three day history of pain in the back of the neck, fever, vomiting and weakness of the right arm, was acutely ill, with spasm of the dorsum of the neck, back and hamstrings and complete paralysis of the left arm and shoulder girdle. Temperature rose to 102 F. for two days. During the first week weakness of the right lower extremity and paralysis of the abdominal muscles were noted. There was occasional vomiting during the first three weeks. Constipation was persistent. Spasm was noted in the paralyzed left triceps, pectorals and latissimus dorsi as well as in the hamstrings and thigh adductors. The Kenny treatment was started on admission. After one month beginning return of function was noted in the left hand and forearm muscles. At discharge there was complete range on passive motion of all groups and contractions were felt in the abdominal muscles during passive exercises. Spinal fluid, 175 cells per cubic millimeter; 100 per cent monocytes; protein 47 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Dec. 13, 1941. Follow-up in March 1942 revealed

almost complete return of abdominal muscle power; grip of the left hand was good, the left shoulder was completely paralyzed with beginning contraction in the biceps and triceps on passive exercises; no atrophy; cosmetic result good.

CASE 68.—M. R., a 17 year old white girl, admitted on Oct. 22, 1941 with a four day history of headache, suprapubic pain, backache, fever, stiffness of the neck and paralysis of both lower extremities, had paralysis of the entire right lower extremity and weakness of the left lower extremity, paresthesias of the right lower leg and spasm of neck, back and hamstrings. Kenny treatment was started on admission. The patient was completely comfortable after twenty-four hours except for occasional paresthesias of the right leg. Power in the left lower extremity returned during the first two weeks. Spasm was noted in the paralyzed right thigh adductors. At discharge there was good range on passive motion at the right knee and ankle. There was minimal atrophy of the right calf muscles. Beginning contraction was noted in the thigh muscles on passive motion. Spinal fluid, 140 cells per cubic millimeter; 95 per cent monocytes; protein 52 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Dec. 13, 1941. Follow-up in March 1942 revealed good range on passive motion of the right leg; atrophy more pronounced than on discharge; quadriceps and hamstrings improving in function; beginning contractions in the gastrocnemius and peroneals on passive motion; beginning flexion deformity of the toes.

CASE 69.—M. M., a 13 year old white girl, admitted on Oct. 21, 1941 with a five day history of fever, stiffness of both legs and of the right arm, dizziness and amnesia, was moderately ill, with slight weakness of the right triceps, quadriceps and iliopsoas; severe spasticity of the dorsum of the neck, back, both biceps, hamstrings, adductors of the thigh; paralysis of the abdominal muscles and glutei; poor diaphragmatic excursion. The Kenny treatment was started on admission. General relaxation started after one week. The patient was able to void after eighteen hours, so that catheterization was unnecessary. Spasm of the hamstrings, biceps and adductors of the thigh and back persisted. There was beginning relaxation after one month. Constipation was persistent. There was beginning return of diaphragmatic and abdominal muscle function during the sixth week. At discharge there was complete range on passive motion in all extremities; moderate weakness of the thighs with continued spasm of the thigh adductors; abdomen poor. Spinal fluid, 110 cells per cubic millimeter; 100 per cent monocytes; protein 75 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Dec. 13, 1941. Follow-up revealed continued rapid improvement of the abdominal muscles; slight persistent back spasm; extremities normal.

CASE 70.—J. G., a 2 year old Negro boy, admitted on Nov. 2, 1941 with a nine day history of sore throat, fever, stiff neck and inability to walk, was moderately ill, drowsy, and was lying in opisthotonos. There were paralysis of both lower extremities, faint contractions in the right quadriceps gastrocnemius and dorsiflexors of the foot and severe spasm of the neck, back and hamstrings. The Kenny treatment was given from admission. Beginning relaxation of the back occurred on the third day. The patient was able to sit up during the fourth week. Return of function started in the third week. On discharge no return of function to the left dorsiflexors of foot and left gastrocnemius had occurred. There was full range of motion. Spinal fluid, 50 cells per cubic millimeter; 100 per cent monocytes; Pandy test 1 plus. Transferred to Orthopedic Hospital on Dec. 12, 1941. Follow-up in February 1942 revealed no function in the left dorsiflexors of the foot and no atrophy or contracture; other muscles showed return of function and power.

CASE 71.—H. J., a 5 year old Negro boy, admitted on Nov. 12, 1941 with a five day history of fever, vomiting, pain and weakness of the left leg, was moderately ill, with severe spasm of the left hamstrings. The thigh was held in flexion. There were severe spasms of the back of the neck, back and hamstrings, weakness of all groups of the left lower extremity and mild biceps spasm. The Kenny treatment was started on admission. Relaxation of the back and hamstrings was noted in one week. Severe spontaneous spasm of the right quadriceps was noted on the twenty-first day and remained for one week. At discharge

there was minimal weakness of the left lower extremity muscles. Spinal fluid, 35 cells per cubic millimeter; 100 per cent monocytes; protein 46 mg. per hundred cubic centimeters. Transferred to Orthopedic Hospital on Dec. 15, 1941. Follow-up in March 1942 revealed a peculiarity in gait due to incoordination of the hamstrings.

COMMENT

It is difficult to measure differences in amounts of recoveries in the two groups of patients, but all those who have observed this group of patients and other groups treated in the orthodox manner are convinced that those who received the Kenny treatment are better off in (a) comfort, (b) freedom from atrophy and deformity, (c) rapidity of recovery and (d) possibly in extent of recovery.

CONCLUSIONS

1. At the present time only symptomatic treatment is indicated in poliomyelitis.
2. Patients with bulbar paralysis respond well to the treatment described.
3. All patients, both paralytic and nonparalytic, should be observed carefully and repeatedly for spasm, and treatment to relieve this symptom should be started immediately on the discovery of the spasm.
4. For patients presenting symptoms of spasm, weakness and paralysis in the acute stage of poliomyelitis, the Kenny treatment is the treatment of choice.

GYNECOMASTIA

A STUDY OF FIVE CASES

JAMES M. SULLIVAN, M.D.

Captain, M. C., U. S. Army
AND

RALPH A. MUNSLOW, M.D.

First Lieutenant, M. C., U. S. Army
CAMP BARKELEY, TEXAS

The finding of 5 cases of gynecomastia within one division of soldiers and the fact that in each instance the man complained of inability to wear a pack because of this condition prompted us to restudy this problem.

The articles of Lewis and Geschickter¹ and Wernicke² give extensive bibliographies and adequately trace the disease down from its first description by Basedow in 1848 to the present. The cause of gynecomastia is still obscure except in that group of cases in which obviously associated endocrine disturbances are present, such as chorionepithelioma or teratoma of the testicle and tumors of the adrenal cortex. The great majority of cases, however, present no associated endocrine disturbance and in none of our cases could we find any abnormalities that might be causative of gynecomastia. There were no atrophied testicles nor undescended testes. Many authors³ mention trauma as a causative agent; although only 1 of our patients gave a definite history of trauma, all the patients stated that the constant wearing of a pack aggravated their condition and caused additional enlargement of the breast.

The pathologic changes that we encountered were identical with those of chronic cystic mastitis in the

From the Surgical Service of Lieutenant Colonel P. J. Sarma, Medical Corps, Station Hospital.

3. Cole and Elman.⁴ Wernicke.⁵

female, more commonly of the adenosis type. There was epithelial hyperplasia of the ducts with papillary proliferation in some sections and also periductal fibrosis corresponding to the hyperplastic phase of chronic cystic mastitis. In 1 case there were also areas familiar to the involutional stage of chronic cystic mastitis having cyst formation and flattening of the epithelium.

It is to be noted in the accompanying table that all the patients came to the hospital complaining of pain and swelling in the affected breast, being made worse by wearing an army pack, a strap of which puts pressure on the breast area. None of these men had evidence of discharge from the breast, although 1 reported that he had had such an incident five years before. Involvement was unilateral in all cases. In none of our cases was there evidence of endocrine disturbance.

Clinical Data on Five Cases of Gynecomastia

Patient, Age	Duration of Symptoms	History of Trauma	Unilateral or Bilateral	Endocrine Disturbance	Chief Complaint	Endocrine Therapy
A. 22	8 yrs.	None	Left	None	Pain and swelling in breast	None
B. 22	1 mo.	Bumped breast in baseball game	Right	None	Pain and swelling in breast and axilla	None
C. 34	7 yrs.	None	Left	None	Pain in breast; enlarged	Methyl testosterone 1 mg. daily for 1 month
D. 21	7 yrs.	None	Right	None	Enlarged, tender breast	None
E. 19	5 yrs.	None	Right	None	Enlarged, painful breast; discharge 5 yrs. previously	None

The treatment of gynecomastia resolves itself into two divergent schools of thought: those who believe that surgery is the method of choice in most cases⁴ and those who believe that the great majority of cases will respond to the androgens, especially if the condition is bilateral.⁵ Adair⁶ feels that unless the condition responds to testosterone it cannot be called gynecomastia but mastitis, and the best treatment for the latter condition is hot compresses and scientific neglect. One of our patients received injections of testosterone for one month (C. in the table) without any amelioration of his symptoms and he was therefore subjected to surgery and a successful result was obtained.

The surgical procedure that we used in all our cases was a Warren type of incision in the lower lateral side of the breast through which the breast tissue was freed from its attachment to the pectoral fascia and skin and removed by blunt dissection. The nipple was preserved.

thereby not producing a cosmetic deformity. The only precaution to be noted in doing this operation is that the skin can easily be button-holed in dissection of the breast tissue just underneath the nipple.

None of our cases corresponded to the definitions of true gynecomastia as set forth by Horsley⁷ and Adair⁶ as being similar pathologically to simple hypertrophy in the female and responding to testosterone therapy in all cases. The changes we found in all cases pathologically corresponded to chronic cystic mastitis, and the therapeutic effect to androgen therapy was nil. This may be explainable on the basis that gynecomastia, as thus defined, can be produced only by some endocrine disturbance and that this disturbance can usually be counteracted by the administration of the androgens. None of our patients showed any endocrine abnormality and we therefore should have expected to find changes only of a chronic inflammatory type. However, the fact that 4 of our patients dated the onset of their disease during the period of adolescence, a fact which all writers have noted,⁸ will not permit us to dismiss completely some endocrine factor as contributing to the causation of the disease.

In arriving at a rationale for treatment, we cannot agree with Adair⁶ that a soldier with this disease who is frequently exposed to the ridicule and censure of his associates and to the psychic trauma of his own flights of fancy, not to mention the obvious pain which he has to endure from the wearing of a pack, should be treated with neglect. He is just as much a casualty, as far as the army is concerned, as if he were suffering from a severe gunshot wound. We believe that endocrine therapy has no place in the treatment of the great majority of these cases. A case of bilateral gynecomastia or one in which there may be some glandular disturbance might warrant a therapeutic test with testosterone. The extended treatment necessary when the androgens are used, the frequency of remissions and the possibility that this expensive substitution therapy may have to be continued indefinitely greatly lessen its value, even if one grants that it may be successful in a sufficient number of cases to justify a trial. Surgical treatment, on the other hand, involves a fairly simple and only mildly incapacitating operation, with complete relief of both objective and subjective symptoms and a loss of time from duty of only ten days to two weeks.

CONCLUSION

1. Gynecomastia in army life is not as infrequent a disease as is generally supposed. Five soldiers were found to have sufficient symptoms to warrant hospitalization in one group of approximately 20,000 troops.

2. The etiology in our cases was not on an endocrine basis, nor were there any associated endocrine disturbances present, except that the condition of 4 of our patients developed during adolescence.

3. The pathologic changes were similar to those found in chronic cystic mastitis in the female.

4. Surgical treatment appears to be the most satisfactory method of handling this condition, both from the point of view of the patient and from that of the service.

ACUTE INFECTIOUS POLYNEURITIS

A DIAGNOSTIC PROBLEM DURING A POLIO-
MYELITIS EPIDEMIC

ADOLPH G. DE SANCTIS, M.D.

AND

MARTIN GREEN, M.D.

NEW YORK

The difficulties attendant to making a diagnosis of acute infectious polyneuritis during an epidemic of poliomyelitis were emphasized in a recent minor epidemic of poliomyelitis. Acute infectious polyneuritis was first described in 1908 by Laurens.¹ The original article of Guillain, Barré and Strohl² in 1916 defined the syndrome as one characterized by a slowly ascending paralysis, a normal cell count with increased protein of the cerebrospinal fluid and a favorable prognosis. The condition has most often been called Guillain-Barré's syndrome. Casamajor³ emphasized the nominal usage because of the inadequacy of the various descriptive names applied to the condition. Yet, because of our reluctance to use proper names, we shall continue to call it acute infectious polyneuritis.

The necessity for differentiating between acute infectious polyneuritis and acute anterior poliomyelitis is more than an academic consideration. The all important question of prognosis is always uppermost in both the physician's and the parent's mind during an attack of either of these diseases. The prognosis of poliomyelitis in the presence of any degree of paralysis is always in doubt for a prolonged period. It is impossible for the physician to prognosticate as to the amount of residual paralysis that will be present when the final stages of the disease have been reached. On the other hand, as suggested by Guillain and Barré in 1916, a favorable prognosis can be made in infectious polyneuritis, predicting the absence of any residual paralysis after a period of months to one or two years.

A great deal of doubt has been cast on this license to present a favorable prognosis by Forster, Brown and Merritt.⁴ They present 26 cases of polyneuritis with facial diplegia and show a mortality of 42 per cent. In this group there were 3 cases that might be included in a pediatric series. The range in ages was from 2 to 15 years. Two of these patients died and 1 evidently recovered completely. The highest spinal fluid cell count among the 3 cases was 11 cells per cubic millimeter, certainly within the normal range. The spinal fluid protein determinations are more controversial. In the 2 fatal cases the spinal fluid proteins were 68 mg. per hundred cubic centimeters and 9 mg. per hundred cubic centimeters; the former is only a slight rise (10 to 47 is normal)⁵ and the latter is low, if anything. On the other hand, the 2 year old child who recovered showed a definitely increased protein to 363 mg. per hundred cubic centimeters.

Forster is justified in including these 2 fatal cases in his group presenting polyneuritis with facial diplegia.

Viets⁶ and Taylor and McDonald⁷ use this terminology and describe similar cases, but if we are to accept Guillain's criterion of a "noteworthy hyperalbuminosis of the cerebrospinal fluid in the absence of cytological reaction" as diagnostic of infectious polyneuritis it is difficult to classify the first 2 cases in this discussion, while the third case, in which recovery evidently occurred, is typical. It is interesting to quote Guillain further in an article published in 1936:⁸ "Our first communication established in cases of polyradiculoneuritis (infectious polyneuritis) of this type, first, the albuminocytological disassociation (increased cerebrospinal fluid protein with normal cell count) in the fluid, and second, the favorable prognosis. I have insisted repeatedly on the two characteristics of this syndrome."

Casamajor presented a series of 22 pediatric cases, 3 his own, 19 from the literature, all fairly typical of infectious polyneuritis and showing the typical albuminocytologic disassociation except in 4 cases. In 2 of these there was no report on the spinal fluid. 1 was reported as negative to the Pandy test for protein and in the last case the spinal fluid was reported entirely negative. In this series all cases except 1 as far as can be determined ended in recovery. The 1 patient who died had a virulent streptococcal infection of the throat. In Casamajor's 3 cases there was complete recovery in all. Casamajor has this to say about the prognosis of infectious polyneuritis: "the prognosis is favorable with recovery over a period of weeks or months, and there are usually no residual signs of paralysis although occasionally muscle atrophy, if present during the disease, persists."

Despite Forster's adverse report, and in view of Casamajor's review of the pediatric literature, we believe that it is reasonably possible to give a good prognosis in these cases. In our own cases, after the first overwhelming acuteness of the illness has subsided somewhat, we have not hesitated to give a good prognosis as to the eventual absence of residual paralysis.

The following 2 cases were seen during a mild epidemic of poliomyelitis. Fifteen cases of poliomyelitis were admitted to our wards over a period of a month and a half.

CASE 1.—C. P., a boy aged 3½ years, a private patient of Dr. De Sanctis, admitted June 17, 1941, awakened the day before admission crying because of his inability to get out of bed. When his mother stood him up he collapsed and complained of severe pain in his lower extremities. The child had not been exposed to acute anterior poliomyelitis. He had waded in water up to his knees the day before onset. A physician was called who noticed weakness of all four extremities, more in the lower extremities than in the upper ones and of greater involvement in the left extremity as compared with the right.

On admission the patient was restless and crying, showed no respiratory difficulties but was sweating profusely. The general physical examination was negative except for neurologic manifestations. The pupils were equal and regular and responded to light. Visual fields appeared grossly negative. All deep and superficial reflexes were absent, except for a one plus response in the left biceps, and there were normal cremasterics. No pathologic reflexes were present. The arms and legs were

absolutely flaccid, the left arm still having some muscle tone. There was some movement of the fingers. Generalized hyperesthesia and muscle pain were present. He was unable to sit up. The red blood cell and white blood cell counts were normal and the sedimentation rate was slightly elevated. The Wassermann reaction of the blood and spinal fluid was negative.

The patient's temperature was never elevated except during an infection of the upper respiratory tract. Two days after admission he showed complete quadriplegia and bilateral weakness of facial muscles. There was no difficulty in swallowing. The pupils were unequal. The hyperesthesia persisted. His voice was nasal and he had difficulty in pronouncing the hard consonants. He remained mentally alert and cooperative. The child's condition continued approximately the same for ten days, at the end of which time some atrophy of the lower extremities was noticed, and there was a definite reaction of degeneration in all the extremities. The patient had also lost sphincter control. One month after admission the facial involvement had disappeared and the patient was able to arch his back, move the left arm slightly and control the right arm. Generalized improvement continued until discharge three months after admission, at which time the patient was able to sit up alone and use his arms to feed himself. He still had weakness of both legs and arms, although he was able to use all four extremities to a limited degree. The voice was definitely improved.

Treatment consisted of administration of vitamin B₁, 100 mg. parenterally every day for eleven days after admission, and of vitamin E, 24 mg. twice a day for two months after admission; splinting of the lower extremities to prevent contraction, and physical therapy starting one month after admission and continuing for one and one-half months. This consisted of tank treatment and under water exercise. The patient took great delight in this form of therapy and showed the most rapid improvement while under this treatment. This unfortunately had to be discontinued because of an intercurrent infection of the upper respiratory tract.

CASE 2.—M. C., a girl aged 9 years, a private patient of Dr. Wenger, admitted Aug. 18, 1941, had been well until two weeks before admission. According to the mother, she caught a cold following an afternoon swim in a pool. Her temperature rose to 102 F. and she complained of "achy pains" in the muscles of the back and legs. Two days before admission the mother noticed that the child was not walking well. When the patient was taken to a private physician he advised admission to the hospital.

The patient was rather heavy set and appeared to handle herself quite well. General physical examination was practically

negative except for the neurologic manifestations. The pharynx was slightly injected. Circumferential measurements of opposite legs, thighs and arms were the same throughout. Musculature on the opposite extremities were comparable. The child had a definite weakness of flexion and extension of the left arm with difficulty in raising the arm above 90 degrees. The grasp of the left hand was weak. There was also weakness of extension and flexion of the left leg, with the additional weakness of plantar flexion and extension on the left. Judging of the gait was not attempted because of the request of the private physician not to have the patient walk. Superficial and deep reflexes were present and normal on admission. She had some

difficulty in sitting up. The red blood cell and white blood cell counts were normal, and the Wassermann reaction of the blood and spinal fluid was negative.

The temperature was normal on admission and throughout the hospital stay. The involved parts became progressively weaker for approximately a week. Five days after admission she began to complain of pain in the muscles of the right calf and weakness of plantar flexion of the right foot. Reflexes at about this time were equal and active, except for an absence

of the right ankle jerk. From this point on the child continued to improve. Physical therapy in the form of light massage and under water exercise were started about one month after admission and continued daily for two weeks, with some improvement. A month and a half after admission the child was allowed up. Her gait appeared normal, but after two days she complained of pain in the muscles of the left calf. Because of this and the fact that her spinal fluid protein showed a sudden increase at this time, she was put back to bed. On discharge the right ankle jerk could not be elicited and she still showed weakness of the plantar flexion of the right foot and plantar extension of the left foot.

These 2 cases emphasize the difficulties of differentiating between acute infectious polyneuritis and poliomyelitis, especially when the former is atypical, as in the second case. When the case is seen during a poliomyelitis epidemic the diagnostic difficulties are certainly multiplied many fold.

Clinically, the two diseases appear similar but when examined more minutely do differ. The history of the two conditions is usually that of a slow progression of symptoms and signs, although the onset occasionally may be sudden and overwhelming in acute infectious polyneuritis. Patients afflicted with either condition complain of hyperesthesia, but in poliomyelitis this is really muscle pain present, when the muscles are activated and on deep pressure.⁹ With infectious polyneuritis the patient, in addition to having muscle pain, has hyperesthesia on superficial touch.

Both diseases may involve nuchal rigidity and tenderness of the back muscles, although these are rare in cases of infectious polyneuritis. The progress of the paralysis is usually ascending in the two conditions, but they definitely differ in their types of involvement. According to Dechaume,¹⁰ the important pathologic condition in infectious polyneuritis occurs in the peripheral nerves. The consequent paralysis is a direct effect of this underlying disorder. The paralysis is usually symmetrical and bilateral and involves the proximal muscles of the extremities more severely than the distal group. This was the situation in the first case, when the patient had an incomplete quadriplegia, partial control of the fingers still being present on admission. Involvement of the cranial nerves is limited mainly to the seventh nerve.

The major underlying disease in poliomyelitis is in the anterior horn cells. The paralysis due to this

9. Toomey, J. A.: Diagnosis of Poliomyelitis, J. A. M. A. 117: 271 (July 26) 1941.

10. Dechaume, Jean: Rev. neurcl. 1: 493 (March) 1932.

underlying condition is segmental—that is, if a segment in the cord is involved the muscle groups supplied by these nerves will be paralyzed. The paralysis is not necessarily symmetrical and bilateral but is often unilateral and irregular in distribution. In addition, the cranial nerve involvement is multiple rather than limited to the seventh nerve.

There is an important differential as far as the progress of the two conditions is concerned. While exacerbations and new paralyses may develop as late as one to three months after the onset of infectious polyneuritis, it is unusual to have any new involvement after the second week of illness in poliomyelitis.

The all important spinal fluid changes confirm the diagnosis. In cases of infectious polyneuritis there is the already discussed albuminocytologic disassociation. It must be emphasized that the high value of the spinal fluid protein may not occur until two weeks after the onset. In cases of anterior poliomyelitis the spinal fluid picture is entirely different. Here there is a cellular

TABLE 3.—*Differential Diagnosis Between Acute Infectious Polyneuritis and Acute Anterior Poliomyelitis*

	Acute Infectious Polyneuritis	Acute Anterior Poliomyelitis
History	Usually slow progressive involvement but may be overwhelming in its suddenness of onset	Slow progressive onset
Pain	Hyperesthesia and muscle pain	Muscle pain
Involvement	1. Ascending paralysis 2. Bilateral, symmetrical involvement usually beginning in the proximal groups of the muscles of extremities 3. Cranial involvement—usually only 7th nerve	1. Ascending paralysis 2. Segmental, often unilateral, irregular muscle involvement 3. Cranial involvement; multiple cranial nerve involvement
Progress	New paralysis may develop for a prolonged period after onset	No further paralytic involvement two weeks after onset
Laboratory	Albuminocytologic disassociation in spinal fluid	Cellular increase in spinal fluid—early polymorphonuclear in character, followed by lymphocytes
Prognosis	Good	Guarded for a prolonged period

increase which very early is polymorphonuclear; a little later lymphocytes predominate. There may be a moderate increase in the value of the spinal fluid protein. This difference in the spinal fluid confirms the diagnosis.

Prognosis is a variable factor in poliomyelitis. At the onset one cannot foretell the amount of paralytic involvement, and after cessation of the active state and in the presence of paralysis one cannot forecast the amount of residual paralysis. In infectious polyneuritis the prognosis is usually good, and one can prognosticate as to the absence of all residual paralysis.

SUMMARY

It is more than an academic consideration to differentiate acute infectious polyneuritis from acute anterior poliomyelitis, especially during a poliomyelitis epidemic, since in the former the prognosis is good and in the latter it is guarded for a prolonged period.

One of the 2 cases of infectious polyneuritis presented is typical and the other is atypical.

5 East Eighty-Fourth Street.

THE ALLEGED EFFICIENCY OF MEDICINAL TREATMENT OF TYPHOID CARRIERS

WINDSOR C. CUTTING, M.D.

AND

G. BERNARD ROBSON, M.D.

WITH THE TECHNICAL ASSISTANCE OF MISS GAIL REEVES
SAN FRANCISCO

Because typhoid carriers are denied occupations involving food handling and care of children, are kept under surveillance by health departments and fear the possible infection of others, their successful treatment is greatly to be desired. Successful treatment would also be important in the present war emergency so as to prevent and control spread of the infection in military establishments. To this end, two general procedures and agents have been proposed: (1) the removal of foci of typhoid micro-organisms, usually by cholecystectomy, and (2) the administration of drugs which might be bactericidal. Curative results have been claimed for both these procedures.

For instance, Bigelow and Anderson¹ in 1933 and Collier and Forsbeck² in 1937 are among those who have reported cures by removal of the gallbladder. This is, however, a major undertaking, which fails to cure the patient in a considerable number of instances. For this reason, others have sought a medicinal cure. Onodera and his co-workers³ in 1931 suggested the use of soluble iodophthalein, and more recently Saphir and Howell⁴ and Enright⁵ have reported apparent cures from its use. That this drug might be effective in curing persons who harbored the bacteria in their gallbladders appeared rational, owing to its concentration in this organ. In 1941 Levi and Willen⁶ reported the cure of a carrier by the use of sulfaguanidine.

We have tried both the soluble iodophthalein and the sulfonamides, and also a new antiseptic, namely phenothiazine and its derivatives, which are excreted in high concentration into the bile,⁷ in 6 typhoid carriers and 1 dysentery carrier. These compounds and others were also tested in vitro for their effects on typhoid bacilli. Although all the results were negative, it is believed that the publication of this report is in order so that physicians and public health officials may not relax established controls of typhoid carriers by putting faith in, or wasting time and effort with, proposed medicinal cures.

Supported, in part, by the Rockefeller Fluid Research Fund of the Stanford University School of Medicine.

From the Departments of Pharmacology and of Medicine, Stanford University School of Medicine, and the San Francisco Department of Public Health.

Dr. J. C. Geiger, Director of the San Francisco Department of Public Health, directed patients to us and supplied soluble iodophthalein. Dr. Floyd DeEds of the U. S. Department of Agriculture at Stanford supplied phenothiazine. Dr. L. P. Gebhardt assisted in the study of the drugs on cultures. Dr. S. L. Christian of the U. S. Marine Hospital gave permission to include case 2. The Lederle Laboratories and L. R. Squibb & Sons supplied sulfadiazine and sulfaguanidine respectively.

EFFECTS ON TYPHOID CULTURES

Phenothiazine, phenothiazone, thionol, tetraiodophthalein, sulfanilamide, sulfathiazole, sulfadiazine and sulfaguanidine were added individually to sterile broth in test tubes to make concentrations of 100 mg. per hundred cubic centimeters (two to six tubes each). The tubes were then inoculated with constant amounts of a suspension of typhoid bacilli in physiologic solution of sodium chloride. Luxurious growth occurred in all the tubes, although this was least in the sulfadiazine tubes. Subcultures from the tubes containing phenothiazine and thionol into fresh tubes containing the same drugs again resulted in plentiful growth.

In an effort to quantitate any possible inhibition of bacillary growth, the drugs (to make 100 mg. per hundred cubic centimeters) were mixed with sterile melted agar and poured into Petri dishes. The surface was then inoculated with a highly diluted saline suspension of typhoid bacilli, but again growth was excellent in all plates, approximating that of the controls.

From this it was clear that none of these compounds, in the high concentrations tried, exhibited a direct inhibitory effect on the typhoid bacillus in vitro. Despite these negative results in vitro, trials were made with patients, because the fate of some of these agents in the body might be different and thereby their inhibitory action enhanced. Furthermore, clinical tests appeared desirable for the sake of completeness of tests and also to check the claims made for iodophthalein and sulfaguanidine.

CLINICAL TRIALS

Trials with certain of the drugs tested on cultures were made on patients, with uniformly disappointing results. In each case the micro-organisms were isolated from the stools and identified by biochemical and serologic procedures in two independent laboratories.⁸ Individual cases are reported as follows:

CASE 1.—A Chinese restaurant keeper aged 50, who was not known to have had typhoid and had no complaints referable to the carrier state, was discovered to be a carrier of the bacilli in a routine examination of food handlers. Before treatment he had one positive, three negative and then one positive stool culture, in that order. He was given phenothiazine 1 Gm. daily for one week, after which his stool still contained typhoid bacilli on two examinations. Then he was given sulfaguanidine 9 Gm. daily for one week, after which stool examinations were negative on five occasions, but on the sixth occasion, or eight months after treatment, the stool was again positive.

CASE 2.—A German seaman aged 55 had typhoid fever at 52. Stool cultures had been consistently positive since then, and a typhoid osteomyelitis of a rib was present. He was given thionol 1.2 Gm. daily for nine days. Cultures of pus from a rib, and the urine and stools were all positive after this. Soluble iodophthalein was given in doses of 4 Gm. on alternate days for six days, then once weekly for one month. Three consecutive cultures made after this treatment still showed the presence of typhoid bacilli. Sulfaguanidine 12 Gm. daily was then given for one week, but two subsequent stool cultures remained positive.

CASE 3.—An American housewife aged 55 did not know how she became a typhoid carrier but was discovered to be one when her brother, for whom she cooked, contracted the disease. Phenothiazine 1.2 Gm. daily was given for one week but failed to render her stool culture negative. Soluble iodophthalein 4 Gm. every other day for three doses, then once weekly for two weeks, was given. The nausea and diarrhea accompanying the medication were partially controlled with camphorated tincture of opium 8 cc. with each dose. Three further stool cultures were all positive. Sulfaguanidine 12 Gm. daily for eight days was given next but failed to remove the infection.

Finally sulfadiazine 6 Gm. daily for five days and, after an interval of one week, 6 Gm. daily for another week and then 3 Gm. daily for a last week, also failed to affect the presence of typhoid bacilli in stool culture.

CASE 4.—An American housewife aged 37 was found to be a typhoid carrier on routine examination, although the stool cultures were irregularly positive. She was given phenothiazine 1.2 Gm. daily for one week without effect on the infection. Following this, soluble iodophthalein 4 Gm. every other day for one week, then once weekly for two weeks, was given. Two weeks later the stool was negative but after another week showed a nearly pure culture of *Eberthella typhosa*. Sulfaguanidine was then given, 12 Gm. daily for eight days, without affecting the stool culture, and finally sulfadiazine 3 to 6 Gm. daily was administered for two weeks. Two subsequent stool examinations were positive for typhoid bacilli.

CASE 5.—A Spanish-American housewife aged 26 had typhoid fever six years before coming under observation as a carrier. Her gallbladder was removed, but her stools continued to be positive for typhoid bacilli. Phenothiazine 1.2 Gm. daily was given for one week. Then, because bacilli were still present, soluble iodophthalein was given, 4 Gm. every other day for one week and then weekly for two weeks. Since this drug also failed to cure her, she was given sulfaguanidine 12 Gm. daily for eight days. Following this, four stool cultures, taken over a period of six weeks, were negative for typhoid bacilli. The next culture, seven weeks after treatment, showed *E. typhosa* in small numbers, but, unfortunately, the biochemical identification was not confirmed serologically. The next four cultures, made eight, nine, ten and eleven weeks after treatment, were negative. Thus, although the single positive culture after the treatment with sulfaguanidine had not been confirmed, it was necessary to consider her not yet cured.

CASE 6.—An elderly American housewife had typhoid fever in May 1941. In August her stools still contained typhoid bacilli, and she was given a course of sulfaguanidine 12 Gm. daily for seven days. Despite this treatment she remained a carrier. Later she was given 12 Gm. of sulfaguanidine and 6 Gm. of sulfadiazine daily for eight days but was not cured.

CASE 7.—A white hospital messenger in his fifties was found to be a carrier of *Shigella paradysenteriae alkaliescens* on routine examination. He received in the following order (1) a course of autogenous bacteriophage, (2) phenothiazine 1.2 Gm. daily for ten days, (3) soluble iodophthalein 4 Gm. every other day for one week and then weekly for three weeks, and (4) sulfaguanidine 24 Gm. daily for four days as well as a longer course with a smaller dose of the drug on another occasion. Stool cultures were positive for the bacilli throughout this extensive, and rather intensive, treatment, though quantitatively somewhat less during sulfaguanidine therapy.

To summarize the medication, 6 typhoid carriers and 1 dysentery carrier were treated. Thionol was given to 1, phenothiazine to 5, soluble iodophthalein to 5, sulfaguanidine to 7 and sulfadiazine to 2.

COMMENT

Although it is disappointing that none of the drugs tried cured the 6 typhoid carriers treated, it is possible that others may do so. The temporary, though imperfect and at best only suggestive, beneficial effect of sulfaguanidine on 2 patients would suggest that this type of compound might be worthy of further chemotherapeutic development. The succinyl sulfathiazole introduced recently by Poth and Knotts⁹ as an intestinal antiseptic was not at our disposal.

It is obvious that long-time "cures" are necessary before a patient can be dismissed. Thus patient 1, who appeared cured six months after treatment, was in fact still a carrier, as demonstrated later. When patient 5 had negative cultures for typhoid, it was thought that sulfaguanidine would be useful for patients who

8. Independent checks were made by the laboratories of the San Francisco Department of Public Health and the clinical bacteriologic laboratory of the Stanford Department of Medicine.

9. Poth, E. J., and Knotts, F. L.: Succinyl Sulfathiazole, a New Bacteriostatic Agent Locally Active in the Gastrointestinal Tract, *Proc. Soc. Exper. Biol. & Med.* 48:129, 1941.

remained carriers after cholecystectomy. Her later relapse did not support this idea.

Several of the patients were more likely to have stools positive for typhoid bacilli when catharsis with magnesium sulfate was used to obtain the specimen. This procedure should be followed if ordinary specimens are not consistently positive. It is interesting that only 3 of the 6 typhoid carriers had had demonstrable typhoid in the past and that only 1 case of typhoid fever was known to have been contracted from these carriers. It should also be noted that 1 patient whose gallbladder was removed was not cured of the typhoid carrier state.

The failure in the dysentery carrier is one of the two failures in the series of Rantz and Kirby.¹⁰ This case is included here also because of its resistance to the other agents as well; and the failure is not to be construed as representing the usual effect of sulfaguanidine in dysentery carriers, which is quite satisfactory.

CONCLUSIONS

1. Six typhoid carriers and 1 dysentery carrier were not cured by treatment with thionol, phenothiazine, soluble iodophthalein, sulfaguanidine or sulfadiazine.

2. The clinical claims of others for iodophthalein and sulfaguanidine were not confirmed.

3. These results agreed with direct negative results with these and some other agents on cultures of typhoid bacilli.

4. As yet there is no dependable or efficient curative drug for typhoid carriers, although further chemotherapeutic development might be attempted with the sulfaguanidine type of compound, but it must be definitely more promising.

5. The established methods for the control of typhoid carriers should not be relaxed by physicians and public health officials in lieu of medicinal treatment.

Clinical Notes, Suggestions and New Instruments

DERMATITIS MEDICAMENTOSA ATTRIBUTED TO CARTER'S LITTLE LIVER PILLS

JOHN A. CONROY, M.D., NEWTON, MASS.

There are many so-called patent medicines advertised and marketed in the United States. The new Federal Food, Drug and Cosmetic Act requires that the ingredients of these products be listed on the package. Carter's Little Liver Pills is a nationally advertised product. It is stated on the package marketed that the pills contain podophyllum resin and Curaçao Aloe. The amount of each drug in each pill or in the entire package is not stated.

O'Donovan¹ stated that podophyllum resin, known as podophyllin, is extracted from the root of *Podophyllum peltatum* L. by percolation with 90 per cent alcohol, precipitation of the resulting tincture in water acidulated with hydrochloric acid, washing and drying. It is a pale yellow to deep orange-brown amorphous powder, soluble in 90 per cent alcohol and in ammonia and partly soluble in ether. The resin yields a percentage of a crystalline substance known as podophyllo-toxin $C_{15}H_{11}O_6$, the remaining amorphous portion being known as podophyllo resin; both substances are purgative.

Podophyllum peltatum L., according to O'Donovan, is a perennial herb commonly found wild in the United States and in some parts of India. It bears a large solitary white flower rising from between two leaves. The yellowish, pulpy fruit is

known variously as May apple, hog apple, raccoon berry, wild lemon and mandrake. Its medicinal use is that of a powerful purgative, and it is sometimes called "vegetable mercury."

The literature reveals no reports of the ingestion of this drug causing dermatitis medicamentosa, but O'Donovan reported several cases and quoted cases reported by Winterburn, Hutchinson and Webster in which dermatitis was caused by contact with podophyllum resin.

Curaçao aloe, as the name suggests, originates in the Netherlands West Indies. Aloe is a genus of plants of the family Liliaceae. There are many species. The American century plant is one of them. There are also a Barbados, a British and another American species. Aloe vera is official in the British pharmacopeia. The drug is the inspissated juice from the leaves of Aloe vera. Aloe chinensis and Aloe pernyi were at one time official in the United States Pharmacopeia but are no longer so. As far as can be ascertained, Curaçao aloe has never been official in either the British or the United States Pharmacopeia.

Aloe contains a crystalline substance, aloin, a resin and a trace of a volatile oil. Aloin is a mixture of anthraene bodies similar to those contained in cascara sagrada, rhubarb and senna. It is less efficient than the crude drug and more irritant. Aloe is a slow acting but efficacious cathartic.

Hamilton² reported a case of acute vesicular dermatitis caused by the ingestion of Curaçao aloe by a woman aged 49. He stated that the patient's eyelids were swollen and the face, arms, legs, groins and the grooves under the breasts were thickly covered by minute vesicles such as are seen in herpes. Over the front of the chest and over the dorsum of the feet these vesicles had become confluent and the surface epithelium lost; acute eczema resulted, and recovery was slow.

In the following case the cutaneous lesions and the progress of the patient are similar to those reported by Hamilton. The case is reported because the product involved is widely distributed and because in possible similar cases the condition may not have been recognized or may have been recognized but not reported.

REPORT OF CASE

H. C. S., a man aged 50, had on Nov. 20, 1941 a large erythematous vesicular lesion on the medial aspect of the right ankle. The lesion resembled an irregular circle and was about 3.5 cm. in its widest diameter.

The patient was first seen on November 28, when he had a generalized erythematous, small vesicular rash which covered the body in large irregular patches. It was particularly noticeable on the lateral aspects of the thighs, the legs and the upper extremities. The entire back, chest and abdomen and the buttocks were covered with small vesicular herpetic lesions.

The chief complaint was intense itching. The temperature and the pulse rate were normal. The heart and lungs were normal. The blood pressure was 140 systolic and 90 diastolic. Urinalysis and the Kahn test gave negative results.

The onset of the generalized dermatitis was sudden, after the initial lesion on the ankle had been present about one week.

The patient's past history was gone over thoroughly with regard to diet and recent medication. The only thing of interest elicited was that about ten days before the appearance of the initial lesion he had taken approximately eight pills of a preparation called Carter's Little Liver Pills. He had never taken this preparation or any other laxative previously. He was not in the habit of taking any "patent medicines." Before the appearance of the rash he had been in excellent health and had had no need to consult a physician for some time. He was not subject to and never previously had had hay fever, asthma, eczema in any form, allergy or cutaneous disease. He had never been on a restricted diet and could not name any type of food which he could say disagreed with him. He was away from home on a business trip at the time he took the pills mentioned. He was not constipated or sluggish when he took them. He said that he had a feeling that he should take something, for no particular reason; so he took about eight of the pills during about three days. He had not used any new type of soap, cream, talc or bath salts.

10. Rantz, L. A., and Kirby, W. M. M.: The Use of Sulfaguanidine in the Treatment of Dysentery Carriers, J. A. M. A. 118:1268 (April 11) 1942.

1. O'Donovan, W. J.: Brit. J. Dermat. 47:13 (Jan.) 1935.

2. Hamilton, Ian: M. J. Australia 1:302 (Feb. 27) 1932.

The rash finally extended all over the body and was composed entirely of minute vesicles. The itching was troublesome. There was edema of the face, of the area about the eyes and of both legs, ankles and feet. The vesicles burst, the skin became moist and crusted and acute eczema resulted.

The disorder progressed slowly, and almost every part of the body was involved. The face, ears, neck, abdomen, chest, back and buttocks slowly cleared, in approximately that order, leaving dry, scaly, slightly pinkish, crescent shaped, macular lesions with a totally clear center. These lesions were more noticeable on the flat surfaces.

The lower dorsal part of the forearms, wrists, hands and fingers after seven weeks presented an acute eczematous condition with much weeping and crusting. The same condition, in addition to considerable edema, was present in both the legs and the ankles. Progress and recovery have been slow.

183 Tremont Street.

Council on Foods and Nutrition

THE COUNCIL ON FOODS AND NUTRITION HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT,

FRANKLIN C. BING, Secretary.

FOODEX INELIGIBLE FOR ACCEPTED FOODS

The Scientific Nutrition Corporation of Bloomfield, N. J., has been actively circularizing physicians and others in an attempt to promote the sale of a so-called vitamin and mineral supplement, Foodex. Many physicians have written to the Council office to inquire about the nature of the product and its possible usefulness. One woman wrote from White Plains, N. Y., "Will you kindly advise me as to the value of Foodex as an addition to the daily diet. Is it worth \$3.50 for seventeen days' supply or are there other preparations just as good which are considerably cheaper?"

From the advertising material distributed by the firm it appears that Foodex is available in three dosage forms designated as "Children-Juniors," "Adults" and "Adults-Seniors," the latter being a preparation recommended for use after the age of 45. The "Adults-Senior" product seems to be a little richer in vitamin content than the other dosage forms. Each vitamin cake and each mineral cake together, of this product, are said to provide:

Vitamin A	10,000 Int. Units
Vitamin B ₁	600 Int. Units
Vitamin B ₂ (G)	2,250 micrograms
Vitamin B ₆	200 micrograms
Vitamin C	750 Int. Units
Vitamin D	1,000 Int. Units
Vitamin E	16.66 mgs. Natural Mixed Tocopherols (60% Alpha Tocopherol)
Nicotinamide	10 mgs.
Calcium	1.0 gram
Phosphorus	0.8 gram
Iron	15.0 mgs.
Copper	1.5 mgs.
Manganese	1.0 mg.
Magnesium	1.0 mg.
Iodine	0.15 mg.
Zinc	1.0 mg.

PLUS—The Entire Natural B Complex Factors and Trace Minerals as Found in 1 gram Yeast Concentrate, 1 gm. Wheat Germ Powder, 400 mgs. Rice Polish Powder, and 13 gms. Dry Defatted Milk Powder.

Of the foregoing list it may be pointed out that the significance of vitamin B₆ or vitamin E in human nutrition has not been established. The need for manganese, magnesium or zinc in amounts beyond those that may be provided in any ordinary human diet has not been shown. If the two "cakes" supply, in the amounts claimed, all of the other substances, namely vitamins A, B₁, G, C and D and the minerals calcium, phosphorus, iron and iodine, they are capable of supplying significant quantities of these dietary essentials. But the Council is aware of no evidence that Foodex will retain all of its vitamin potencies under the usual conditions of storage and use; indeed, there is much evidence that vitamins A and C in products such as

Foodex purports to be are especially unstable and are destroyed to a large extent during storage. Further, it is emphasized by all recognized authorities in nutrition that healthy persons can and should receive their dietary essentials by eating an adequate diet, not by consumption of products such as Foodex.

The promotional armamentarium of the firm includes an elaborate brochure entitled "Man a Nutritive Process" and three "Manuals for the Profession" bearing the imposing titles "Geriatrics' The New Science of Keeping Fit after 45," "A New Scientific Individualized Reducing Technique" and "A Dietetic Diagnostic Technique." These booklets consist of a mixture of truths and half truths cleverly blended to make it appear to be extraordinarily difficult to obtain the necessary nutrients from ordinary foods, unless the diet is supplemented with Foodex. Scarcely a single trick long known to "patent medicine" promoters has been overlooked in compounding this advertising material.

CONSIDERATION OF THE BROCHURE "MAN A NUTRITIVE PROCESS"

Examination of the booklet "Man a Nutritive Process" is an interesting adventure for those who like their historical and scientific subjects presented without strict regard to truth. The first three pages of this brochure consist of a brief inaccurate account of the modern knowledge of nutrition. While research workers in numerous laboratories even now strive to determine the biochemical functions of the various vitamins and minerals that are essential in the diet, the anonymous author of this brochure glibly dismisses the interrelationship between vitamins and minerals in the following manner: "One of the principal functions of vitamin D is its influence on calcium and phosphorus absorption. Vitamin A increases the utilization of iron. Manganese is needed to assist the action of vitamin B₁. There also is an interrelationship between manganese and vitamin C. Calcium deficiencies are accompanied by inability to utilize vitamin B₁. Vitamin E appears to be correlated with better utilization of iron, etc., etc." Although there may be a vestige of truth in the statement regarding vitamin D, none of the other quoted statements can be substantiated.

Three pages of this brochure are devoted to a comparison between the methods of preparation and preservation of foods used in "Grandfather's Age" and the "Present Age." These statements are intended to show why grandfather got an abundant supply of dietary essentials by eating honest-to-God food and why people today do not get enough of them, unless they eat Foodex. Much unwarranted emphasis is placed on nutritional deficiency in man as a result of depletion of soil, loss of vitamins as a result of storage of foodstuffs, long distance transportation, pasteurization, commercial canning of fruits and vegetables, quick freezing and cooking of food products. Of course, the firm has not fully taken into consideration that the modern processing methods enable us to obtain safe and wholesome foods throughout the year. An amusing comparison concerns meats. In grandfather's day, so it is said, "The local butcher was an important person. He supplied fresh-killed meat which was consumed immediately." In the present age, so the account reads, ". . . our meats are canned, pickled, smoked, sauged, and corned. They are refrigerated and cold stored, and as they finally reach our dinner table cooked, their vitamin content is greatly diminished." There is practically no loss of the vitamins in meat as a result of refrigeration and, unless grandpa ate his meat raw, he didn't get any more of the heat labile vitamins from meat than do his grandchildren.

There are a number of pages devoted to abstracts of original papers, no doubt without permission of the authors and presented in such a way as to make it appear impossible to obtain an adequate diet without the use of vitamin-mineral supplements. In addition to quotations from published articles of leaders in nutrition, these quotations being removed from their context and thus being capable of producing an effect entirely different from that intended by the authors, there are included abstracts of articles written by newspaper columnists and other rewrite men. Thus U. S. Senator Fletcher is quoted as having said that 99 per cent of the American people are deficient in essential minerals due to depleted soils and vegetation, and David Dietz is reported to have announced that medical men are just

finding out that among the principal causes of night automobile accidents is vitamin A deficiency. The reports by senators and newspaper men might be impressive to the layman who is in no position to judge the scientific qualifications of the persons making the statements, but authorities on nutrition do not believe that there is sufficient evidence at the present time to warrant either of these statements.

The firm is not at all reticent about discussing the "Physiological Effects Arising from Vitamin and Mineral Deficiencies" and "The Functions of Vitamins and Minerals." In the presentations offered, no attempts have been made to differentiate between the signs of deficiency diseases observed in experimental animals and those observed in man. Descriptions of manganese, magnesium and zinc deficiency are written in such a way that one readily gains the impression that these discussions apply to the human being, for whom no deficiency diseases due to lack of these three elements have been reported.

It must be irritating for informed physicians to read assertions such as the following: "There are two methods of obtaining vitamins and minerals. (1) By changing your eating habits to include daily large amounts of protective foods (milk, dairy products, eggs, vegetables, fruits, whole-wheat and dark grains),"—well enough, but look what follows—"all carefully selected and thoroughly checked as to their vitamin content, properly prepared and scientifically cooked under controlled temperatures, as will be indicated below." And "below" the firm has the effrontery to list sixty-four practical suggestions for the preservation of vitamin and mineral values in selecting, preparing and cooking foods. Here is an example of one of the sixty-four statements: "Buy fruits and vegetables from markets that receive them fresh daily. Inquire the source of growth, whether stored, or freshly picked. The destruction of vitamin C starts as soon as vegetables are gathered and gradually continues." After establishing all of these obstacles to its own satisfaction, the firm points out the second way to obtain adequate vitamins and minerals. (This is by the regular consumption of Foodex, of course.)

It is not generally well known how misleading comparative statements regarding foods may be, even when the statements are true. The Council has long held the view that the effect produced by advertising statements is just as important as the actual statements themselves. The Scientific Nutrition Corporation compares the nutritive value of Foodex with a number of natural foods. These foods are listed and illustrated under the caption "Amounts and Kinds of Foods one would have to consume to receive the Vitamins and Minerals contained in a daily supply (one vitamin cake and one mineral cake) of FOODEX (type Adults-Seniors)." It is claimed, for example, that one would have to eat $1\frac{1}{4}$ pounds of butter, 3 pounds of wheat, 4 pounds of cream cheese, $3\frac{1}{2}$ pounds of apples, $12\frac{1}{2}$ pounds of oysters, 1 quart of milk, $\frac{3}{4}$ pound of graham crackers, 1 pound of raisins, six medium bananas, 6 tablespoons of lima beans, 3 cups of cabbage and 30 grs. (grams?) of cod liver oil in order to obtain one's daily supply of vitamin A, B₁, B₂ (G), C, D, calcium, phosphorus, iron, copper, manganese, magnesium and iodine respectively. Even if Foodex contains as much of these dietary essentials as the quantities of foods with which Foodex is being compared, it obviously would not be necessary to eat these quantities in order to obtain an adequate diet, because each of the foods mentioned contributes also a portion of the other essential nutrients. For example, cod liver oil supplies vitamins A and D, yet the firm compares Foodex only with the iodine content of cod liver oil. The only way to make comparisons properly is to point out dissimilarities as well as resemblances.

OTHER PROMOTIONAL LITERATURE

The other advertising material used by the firm contains much of the same sort of material found in "Man a Nutritive Process." In the booklet entitled "'Geriatrics' the New Science of Keeping Fit after 45" the headings of much of the material has been reworded so as to give the impression that the quotations cited refer to old age. As an example, here is the heading "Phosphorus Important to People After 45 Because It Aids the Work of Glands." The following statement appears under this heading: "The American diet is more likely to be faulty in calcium than in any other mineral element. Phosphorus also contributes

to bony structure and forms an integral part of every cell multiplication and is found in organic union with proteins, fats and carbohydrates. It aids in the work of various glands." Contrary to implication, these statements are not direct quotations from Dr. McLester's "Nutrition and Diet in Health and Disease" but they are phrases and clauses taken from the original text and compiled into new sentences. It is thus made to appear that phosphorus deficiencies are as prevalent in the American diet as calcium deficiencies, which of course is false, and no assertion to that effect can be found in the original text nor was intended by its author.

As might be expected, the booklet "A New Scientific Individualized Reducing Technique" calls attention to the ease of obtaining an adequate diet when Foodex is consumed. There is a so-called "Vitadiet Plan," which means the use of Foodex in diets for reducing purposes.

There is a copy of a "Dietetic Questionnaire" in the booklet entitled "A Dietetic Diagnostic Technique." This questionnaire apparently is to be used in determining the adequacy of a patient's diet. It would appear, however, that the procedure is included only to stress the ease with which Foodex solves all the problems. Detailed discussion of this advertising is unnecessary.

CONCLUSION

Foodex, a preparation of the Scientific Nutrition Corporation, Bloomfield, N. J., is a product which is promoted with exaggerated and misleading claims. The composition and advertising are in conflict with the rules and policies of the Council.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E. SMITH, M.D., Acting Secretary.

LIVER AND STOMACH PREPARATIONS (See New and Nonofficial Remedies, 1941, p. 335).

PURIFIED SOLUTION OF LIVER-LAKESIDE.—A sterile aqueous solution of liver preserved with 0.5 per cent of phenol. The daily parenteral administration of 0.1 cc. has been found to produce the standard reticulocyte response defined as 1 U. S. P. unit (injectable) when assayed in cases of pernicious anemia as required by the Council.

Actions and Uses.—Purified solution of liver-Lakeside is used for intramuscular injection in the treatment of pernicious anemia. See the general article Liver and Stomach Preparations, New and Nonofficial Remedies, 1941, page 328.

Dosage.—The amount to be administered will depend on the condition of the patient. When the erythrocyte count is below 1,000,000 per cubic millimeter, injection of 10 U. S. P. units daily or on alternate days is recommended. The physician will be guided by the change in blood picture. Injection of 10 U. S. P. units weekly or every ten days will generally maintain the patient.

THE LAKESIDE LABORATORIES, INC., MILWAUKEE.

Ampule Purified Solution of Liver, 10 U. S. P. Injectable Units per cc.: 1 cc.

Purified Solution of Liver, 10 U. S. P. Injectable Units per cc.: 10 cc. vial.

Purified Solution of Liver, 2 U. S. P. Injectable Units per cc.: 60 cc. vial.

Preparation.—Purified solution of liver-Lakeside, 10 units per cubic centimeter, is prepared as follows: Fresh edible liver is extracted with water at 170 F. for thirty minutes and filtered. The filtrate is concentrated in vacuo and extracted with 70 per cent alcohol; the alcoholic extracts are concentrated in vacuo and precipitated with ammonium sulfate. The precipitate is further purified by alcoholic fractionation, the alcohol removed and the extract made up to volume so that each cubic centimeter contains the extract from 100 Gm. of fresh liver. Five-tenths per cent phenol is used as a preservative. The 2 U. S. P. unit preparation is prepared by diluting the 10 unit product with the appropriate amount of water.

535 NORTH DEARBORN STREET - - - CHICAGO, ILL.

Cable Address - - - "Medic, Chicago"

Subscription price - - - : Eight dollars per annum in advance

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, APRIL 25, 1942

ENROLMENT FORM AND QUESTION- NAIRE FOR PROCUREMENT AND ASSIGNMENT SERVICE

This week to every physician licensed to practice in the United States there is mailed the long awaited enrolment form and questionnaire of the Procurement and Assignment Service. It comes jointly from the National Roster of Scientific and Specialized Personnel and the Procurement and Assignment Service for Physicians, Dentists and Veterinarians. Each of these agencies is, in turn, related to others and ultimately to the Executive Office of the President. Every physician who receives the medical enrolment form should fill it out as completely as possible and return it immediately in the franked envelop which accompanies it. Opportunity is given to indicate first, second, third and fourth choices of assignment, and it is hoped that the complete functioning of this service will be such that Army, Navy, public health, civilian and industrial needs may be met.

As we go to press the Army requires five thousand physicians, in excess of those already enrolled, to meet existing needs. Therefore, every physician ready now for service who knows that he is not filling an essential position may apply at once to the office of the corps area commander in his area, to the Office of the Air Surgeon, Army Air Force, Washington, D. C., or directly to the Office of the Surgeon General in Washington so that he may receive at once an application blank and proceed to have a physical examination. The Procurement and Assignment Service headquarters in Washington, aided by the consulting office in the American Medical Association and the individual corps areas and state offices, will continue to clear the names of physicians who apply.

This week in Washington a meeting has been called of state representatives of the Procurement and Assignment Service east of the Mississippi River only together with officers of the Army and Navy medical departments, the corps area officers and the board of the

Procurement and Assignment Service to work out plans which will aid recruitment in the individual states. Such plans will, of course, be announced just as soon as they have been suitably drawn and made available. The chairmen for veterinary medicine and dentistry have not been called because there exists no shortage in the supply of these professions for the armed forces. Chairmen of states west of the Mississippi River will meet at a later date at some city west of the Mississippi River.

The physicians of this country have invariably responded to the needs of the armed forces whenever they have been called upon. The Selective Service System makes every man in the United States under 45 years of age available on call. Complete cooperation through use of the enrolment form and through direct application by those ready to volunteer immediately will meet the various demands on medical services without making necessary any call on the Selective Service System for the provision of necessary physicians to the armed forces.

STATUS OF GASTRODUODENAL ULCER

An editorial in the May 4, 1935 issue of THE JOURNAL pointed out some of the inadequacies of the circulatory, the infectious and the mechanical functional theories of the genesis of gastroduodenal ulceration; it concluded that "the accumulated clinical and experimental observations force the clinician and the experimental worker once more to look to the digestive part of the gastric secretion as the most important factor in the genesis of the ulcer." A symposium by physiologists, internists and surgeons in a recent issue of the *Archives of Surgery* reemphasizes the importance of the acid gastric secretion in the causation of gastroduodenal ulcer. Schiffrin and Ivy¹ state that destruction of gastric tissue results from the proteolytic action of the gastric juices. They do not wish to imply that the excessive secretion of gastric juice or its retention in the stomach is the cause of gastroduodenal ulcer. They believe, however, that the irritating action of acid and pepsin is the prime factor in the genesis of postoperative jejunal ulcer and is important in the development and perforation of duodenal ulcer.

According to Quigley,² hunger contractions through mechanical trauma to the area involved may give rise to distress to the patient with ulcer and may prevent healing. It is desirable to avoid the conditions which tend to exaggerate hunger contraction.

2. Quigley, J. P.: Motor Physiology of the Stomach, the Pylorus and the Duodenum, with Special Reference to Gastroduodenal Ulcer, *Arch. Surg.* 44: 414 (March) 1942.

According to Dragstedt,³ pure gastric juice has the capacity of destroying all living tissue, including the wall of the stomach itself. Animal experiments utilizing a Pavlov or Heidenhain pouch have demonstrated that pure gastric juice has an aggressive action on living tissue as contrasted with the gastric content, which usually consists of a mixture of swallowed food and saliva, gastric juices from the parietal cells of the fundus, mucus and a neutral or faintly alkaline secretion from the pyloric antrum and varying quantities of regurgitated duodenal juices. This gastric content is relatively inert. In all the experiments in which pure gastric juice from an isolated pouch of the stomach is permitted to flow into the lower intestine, the ulcer forms in the intestine rather than in the gastric mucosa. Since the exposure is similar, one must conclude that the gastric mucosa has the greater resistance to digestion. Under normal conditions the gastric wall is not digested away because it is not exposed to pure gastric juice. A continuous gastric secretion occurs which is not dependent on the presence of food. It is slight and its small volume permits its neutralization by the mucus of the pyloric antrum, swallowed saliva and possibly also regurgitated duodenal contents. It is conceivable, Dragstedt points out, that this neutralizing mechanism may fail or prove inadequate and that, as a result, more or less pure gastric juice may accumulate in a stomach empty of food. It seems probable that some abnormality of this type is responsible for most cases of ulcer in man. Anderson and Fogelson reported a relative decrease in the gastric mucin in some patients with duodenal ulcer. Artificially induced continued excessive secretion of gastric juices by implanting histamine pellets in wax produced ulcers in all the common laboratory animals. Dragstedt advances the opinion that in man a similar excessive secretion of gastric juice occurs and an ulcer begins. The hypersecretion in most cases is probably neurogenic and is abnormal in the sense that it operates when the stomach is empty and in the absence of usual stimuli for gastric secretion.

The problem of ulcer in man, according to Palmer,⁴ is one of tissue resistance versus acid attack. Vanzant and her collaborators have found that there was an increase of about 12 units of free acidity in the case of duodenal ulcer. In the case of gastric ulcer the mean free acidity was lower than normal by about 6 units. The incidence of achlorhydria was half that observed in normal persons. Peptic ulcer occurs in persons with a low secretory rate as well as in those with a high secretory rate. Chronic ulcer does not occur in persons with a complete and continuous

achlorhydria. Nocturnal secretion, however, exceeds in amount and acidity that observed in normal persons. The presence of acid gastric juice is essential for the production of erosions and ulcers. Pepsin greatly facilitates the progress, but it alone will not destroy the mucosa. The chief protection against the acid attack on the cells of the mucosa seems to be provided by the thin layer of mucus with which they are covered. Thrombosis, embolism and infection are not essential features of experimental ulcer. Palmer calls attention to the fact that ulcers may, and the majority do, heal in spite of the presence of acid gastric juice. This is evidenced by the spontaneous remissions and by the healed lesions encountered in routine necropsies.

There appears to be considerable agreement between internists and surgeons as to the treatment of duodenal ulceration. The wave of enthusiasm for stomach resections which began a quarter of a century ago and was advocated with particular fervor in Germany has now considerably subsided. Thus, Allen⁵ states that duodenal ulcer is primarily a medical problem and that apparently 80 per cent of the patients with this lesion respond to conservative measures. This is essentially what Sippy has taught for a number of years: that the surgical indications for duodenal ulcer were complications, namely acute perforation, massive hemorrhage, cicatricial obstruction and intractability. Allen believes, as do practically all surgeons today, that surgical cure for duodenal ulcer can be brought about only by a subtotal gastric resection. The operative mortality from this procedure has been reduced to a level compatible with the results obtained. Wangensteen⁶ emphasizes that the most important criterion of an acceptable operation is that it reduces gastric acidity effectually. He feels that the three-quarter resection meets these demands. The only known manner in which the secretion of acid may be diminished effectually is by sacrificing a liberal portion of the gastric mucosa. Excision of antral mucosa is mandatory to insure achlorhydria. The antral mucosa probably contains a hormonal stimulant of gastric secretion other than histamine.

The case of gastric ulcer differs from that of duodenal ulcer principally because of the ever existing danger of malignant degeneration. Walters⁷ finds that in 10 per cent of the cases gastric ulcer is malignant. He emphasizes that in many cases of chronic gastric ulcer healing is temporary under nonsurgical methods of treatment and recurrence is frequent. The triad which in the past was depended on to insure that the lesion is benign, namely relief of symptoms, disappearance

6. Wangensteen, Owen H., and Lammie, Bernard: Importance of the Acid Factor, *Arch. Surg.* 44: 489 (March) 1942.

7. Walters, Walzman: Gastric Ulcer, Benign or Malignant, *Arch. Surg.* 44: 520 (March) 1942.

of the niche in the roentgenogram and the disappearance of blood from the stools, cannot be absolutely relied on. Schindler and Arndal stress that it is in the differentiation⁸ of benign and malignant ulcer that gastroscopy is most useful and is here superior to roentgenoscopy. They admit, however, that the method had failed to make a correct differential diagnosis in 6 of 113 gastric ulcers. According to Eusterman, gastric carcinoma not only may masquerade successfully as benign ulcer but may react to treatment in similar fashion. Sarah Jordan summarized this problem by stating "Neither the size of the ulcer nor the age of the patient nor the presence of normal acid or hyperchlorhydria should lessen our suspicion of carcinoma, for some of our largest lesions have been benign and some of the smallest malignant. Malignant lesions occur often enough in the young, and benign ulcers often enough in the middle aged and old, and acid is present often enough where the lesion is malignant, so that these three criteria of size of ulcer, age of patient and presence or absence of acid have no actual or practical value in the diagnosis of the individual patient." Proper surgical treatment of gastric ulcer, according to Walters, has been followed by excellent results. In his experience, recurrence has not taken place when one-half the stomach was removed. The operative risk should not exceed 5 per cent and in the hands of skilled surgeons should be less than that.

AFFILIATED UNITS IN THE ARMY MEDICAL DEPARTMENT

Over two years ago the Surgeon General of the Army was granted authority to form certain general, evacuation and surgical hospitals as sponsored units of medical schools or large civilian hospitals. These were called "affiliated units" and were given numbers which, in many instances, corresponded to numbers of similar organizations sponsored during the first world war.

Specific tables of organization were drawn up for these hospitals, and the sponsoring institution was directed to fill the positions from among individuals connected with the institution. Physicians who were recommended were given "affiliated" commissions in the grades set up in the table for the positions they were to occupy. These officers are for duty only with the organization in which they are commissioned. Many have requested active duty prior to the calling out of the unit, and this has been granted, with the understanding that they will be returned to their units as soon as these units are activated.

Some misunderstanding has occurred among reserve officers as to the reason for commissioning these affiliated officers in higher grades than they themselves hold in the reserve corps. Information from the Office of the Surgeon General indicates that the "affiliated" officer

is commissioned to perform a specific duty in his unit, the grade is fixed, and he will remain with the unit. He can be promoted only in the unit if a vacancy occurs in a higher grade and he can qualify for the position.

Current Comment

JOURNAL OF NEUROPATHOLOGY AND EXPERIMENTAL NEUROLOGY

The first number of a new periodical entitled the *Journal of Neuropathology and Experimental Neurology* has just appeared under the editorship of Dr. George B. Hassin, with whom are associated a number of workers in this special field. The first number contains eleven original contributions in the field concerned and also a condensation of the transactions of the annual meeting of the American Association of Neuropathologists, which was held in Atlantic City during June 1941. A survey of the material here included indicates the great advancement that has taken place in this field in recent years. The appearance of a new, well edited, highly scientific publication of this character at this time is an indication of the progressiveness and vitality of American medical science.

NEW OBSERVATIONS IN POLIOMYELITIS

Elsewhere in this issue of THE JOURNAL appear a number of reports covering recent observations in poliomyelitis. The advances that have been made give assurance of greater preparedness on the part of the medical profession in meeting any outbreaks of the disease that may arise in 1942. The paper by Pohl of Minneapolis describes the first 26 cases treated directly under the advice of Miss Kenny. Emphasis on spasm of the muscle as a condition to be promptly controlled is a prominent feature of this discussion. The author is convinced that the method should be immediately adopted as the fundamental treatment of the disease. Already the results in 28 cases treated subsequently promise even more remarkable recovery. From the Willard Parker Hospital in New York comes a statement by Daly, Greenbaum, Reilly, Weiss and Stimson concerning 71 patients. Their conclusions, while most conservative, again emphasize the importance of spasm in muscle. These observers also stress the increased comfort of patients treated with this technic. They offer furthermore a better understanding of the significance of what Miss Kenny calls "mental alienation." The New York observers confirm the results reported from Minnesota to the effect that patients who receive the Kenny treatment are better off in comfort, freedom from atrophy and deformity, rapidity of recovery and possibly in extent of recovery. Step by step the battle against poliomyelitis is being won. The information that has been gained on the nature of the virus and methods of its transfer has been notably extended during the past year. The contributions of physiologists, neurosurgeons and physical therapists help to overcome the ravages of the disease.

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession.

QUININE CONSERVATION ORDER

The fulfilment of requirements for the defense of the United States has created a shortage in the supply of quinine. In an effort to relieve this situation, the Director of Industry Operations of the War Production Board has issued an order (Conservation Order M-131) which provides that after its effective date, April 4, no person may sell, transfer or deliver, or purchase or accept any transfer or delivery of, any quinine except for use as (1) an antimalarial agent or (2) an ingredient of quinine and urea hydrochloride (U. S. P.) for hypodermic use.

Except in the case of a sale, transfer or delivery to an ultimate consumer, no person may sell, transfer or deliver any quinine except on receipt of a certificate manually signed by the person purchasing or accepting transfer or delivery or a duly authorized official, in substantially the following form:

I hereby certify that the quinine ordered hereby is for use as (1) an antimalarial agent or (2) an ingredient of quinine and urea hydrochloride (U. S. P.) for hypodermic use and will not be sold, transferred or delivered by me for any other purpose. This certification is made in accordance with the terms of General Preference Order No. M-131, with which I am familiar.

Name
By

Any stock of quinine, whether in the form of solution, pill, tablet or capsule, but not including preparations containing quinine which has been combined or compounded with other medicinal agents, consisting of less than 50 ounces physically located at any one place on the effective date of the order will not be subject to these provisions and restrictions. Such stock may be disposed of by the owner without restriction. The order does not apply to purchases by importers of quinine to be delivered from outside the continental United States. Any subsequent dealing in quinine after its importation, however, will be governed by the order. The order does not apply to the purchase, sale or use of any preparation containing quinine which, on the date of the order, has been combined or compounded with other medicinal agents.

Every person having in his control or possession on the date of the order (1) any stock of quinine consisting of more than 50 ounces, whether in the form of solution, pill, tablet or capsule but not including preparations containing quinine which has been combined or compounded with other medicinal agents, which stock is physically located at any one place, or (2) over 50 pounds of cinchona bark must make a report on form PD-401. All reports required to be filed and all communications concerning the order should be addressed to the War Production Board, Health Supplies Branch, Washington, D. C., Ref. M-131.

A violation of the order will constitute a criminal offense. In addition, any person who wilfully violates any of its provisions or who by any act or omission falsifies records to be kept or information to be furnished may be prohibited from receiving any further deliveries of any material subject to allocation.

MEDICAL COLLEGE IN CHINA CLOSED BY JAPANESE

Information has been received that the Peiping University College of Medicine, Peking, China, was closed on February 1 by Japanese military authorities. Dr. Henry S. Houghton, who was director of the college, is reported to be held in custody.

THE DISPATCH OF EMERGENCY CASUALTIES AMONG CIVILIANS

According to Dr. E. L. Keyes, chairman, First Aid Posts Committee, St. Louis, the majority of air raid casualties in the London air raids of 1940 and 1941 were sent to only a few hospitals. St. Louis intends to adopt this plan and to send the first of its war casualties to St. Louis City and Homer Phillips hospitals and to defer the use of its other hospitals until after these two city institutions have become filled.

The full implications of such a policy should be considered before it is adopted.

DATA

1. Experienced surgeons are agreed that the "golden period" for the operative treatment of fresh wounds is eight hours. All war wounds first treated by operation after eight hours are, with few exceptions, badly infected. Every fresh wound should be treated within eight hours, and any delay is a most serious matter and may entail the loss of many lives that could otherwise be saved.

2. Stretcher casualties in St. Louis can be moved from a "war incident" to a hospital at an hourly rate up to three stretcher casualties per ambulance per mile, as has been found by test mobilizations.

3. The Office of Civilian Defense states that major operating room casualties received in a hospital can be cleared through the operating room at the rate of three major operative casualties every two hours per operating room with two operating teams.

4. Fractures constitute the bulk of air raid casualties, as may be judged from British figures compiled by Dr. Carl Heifetz. Of 100 air raid casualties, injuries were distributed as follows: Multiple major injuries, 33; lower limbs and hip, 22; upper limb and shoulder, 15; thorax, 12; abdomen, 9; head and neck, 8.

5. An estimate of the number of casualties to be expected may be judged by the following figures: Of every 100 air raid casualties, 30 are killed outright, 42 are stretcher casualties (14 of them sitting) and 28 are walking casualties.

6. Hospitals may well take inventory of their operating room service by estimating how many compound fractures they can treat hourly in the operating room by open reduction and plaster application. A compound fracture is used as a standard merely because it seems to be the most common civilian war injury demanding major surgical attention in the operating room.

CALCULATIONS

7. Hospitals should calculate (from paragraph 6) the number of major open reductions they can clear through their operating rooms in seven hours. Hospitals should assume (from paragraph 2) that it takes the first aid service one hour on the average to transport a casualty from a "war incident" to the hospital. No hospital should be asked to receive more casualties than it can treat operatively within eight hours of injury (see paragraph 1).

TENTATIVE CONCLUSIONS

8. Hospitals will give surprisingly low estimates for the number of major fracture casualties their operating services can clear under paragraph 7. Thus, hospital A may say 15 such casualties, hospital B may say 12 and hospital C may say 6, a total of 33 such casualties in seven hours by three large hospitals.

DISPATCH OF AMBULANCES

9. These data give an accurate way of dispatching ambulances by central control. Assume 33 major compound fractures. Assume an ambulance capacity of 4 stretcher casualties per

vehicle. The 33 casualties require nine ambulances for their transport.

Where should these go? Ambulance 1 may be dispatched to hospital A, ambulance 2 to hospital A, ambulance 3 to hospital A and ambulance 4 (maybe) to hospital A. Ambulances 5, 6 and 7 may be dispatched to hospital B, ambulances 8 and 9 may be dispatched to hospital C.

10. By thus rotating ambulances according to a logical pre-arranged schedule, overtaxing of the services of any given institution or group of institutions may be avoided.

11. Further, and most important, such rotation insures all the wounded, as far as is humanly possible, of receiving surgical treatment within eight hours of injury; i. e., in the "golden period."

12. The British, we are informed by Dr. Charles G. Bradford of Dr. Philip D. Wilson's American Hospital in London, now believe that this system of rotation of ambulances is preferable to the one they first tried.

ARMY WINTER SICK RATE SHOWS DECREASE

The general health of the Army during the past winter was about 50 per cent better than for the same period a year before, the Surgeon General informed the War Department on April 9. Normally higher admission rates during the winter months are expected. The past winter has been an exception, and sick rates were unusually low. Annual hospital admission rates per thousand for the winter period November to February inclusive for the U. S. Army in the United States show a 50 per cent reduction in admissions from all causes, 52 per cent for disease only and 70 per cent for respiratory infections from those of the corresponding period in 1940-1941. The reductions translated into days added for training, savings in drugs and hospital supplies, transportation and incidentals represent a decided addition to the war effort, not to mention the effect on morale and well being, the report said.

The Surgeon General cites the following factors as making for improvement:

1. Health conditions throughout the United States were very good despite the changes due to war, and no extensive epidemics occurred.

2. The Army was composed of seasoned troops who had months of rigorous training in camps and maneuvers. New men were absorbed in old units.

3. The increase in the Army was limited to the facilities available for housing, supply and hospitalization. In other words, preparations for the care of the soldier were complete before he was called to service.

4. Preventive measures were enforced in the Army to assure proper food, pure water, adequate clothing, ventilation, heating and wholesome exercise and amusement.

5. Surgeons were interested in guarding the health of the command through sick call, sanitary inspections and in the hospital.

APPOINTMENTS IN OFFICE OF CIVILIAN DEFENSE

Dr. Thomas B. McKneely, passed assistant surgeon in the U. S. Public Health Service, has been assigned to the Medical Division, Office of Civilian Defense, Washington, D. C., to assist in the organization of emergency medical services throughout the United States. Dr. McKneely is a native of Louisiana and graduated from Tulane University School of Medicine, New Orleans.—Dr. Burt A. Dyar, since 1939 regional medical officer for the Farm Security Administration, with headquarters in Indianapolis, has been appointed regional medical officer for the Fourth Civilian Defense Region with headquarters in Atlanta. Dr. Dyar is a graduate of the University of Minnesota Medical School and during the first world war attained the rank of lieutenant colonel in the Army Medical Corps. For four years he was executive secretary of the South Dakota State Medical Association.—Dr. Wallace D. Hunt, Regional Medical Officer for the Ninth Civilian Defense Region with headquarters in San Francisco, has been made regional medical officer of the Seventh Region with headquarters at Omaha.—Dr. James M. Mackintosh, professor of public health at the

University of Glasgow, has returned to Scotland after spending several months in the United States as a guest of the Rockefeller Foundation, during which time he acted as consultant in medical defense in the Office of Civilian Defense, Washington, D. C., and visited many parts of the United States, lecturing on Emergency Medical Service.

"WAR SESSIONS" AT MINNEAPOLIS AND MADISON

The final two meetings of the series of twenty-five "war sessions" being conducted by the American College of Surgeons will be held on May 1 in Minneapolis and on May 4 in Madison, Wis. The latter meeting was originally announced for April 29 but was postponed because of a conflicting medical meeting. Headquarters for the Minneapolis meeting will be at the Radisson Hotel and for the Madison meeting at the Loraine Hotel. Physicians from Minnesota, North Dakota and South Dakota will participate in the Minneapolis meeting, and those from Wisconsin in the Madison meeting.

Lieut. Col. B. Noland Carter of the Office of the Surgeon General, United States Army, Washington, D. C., will represent the Army, and Capt. Frederick R. Hook, chief of the surgical service, United States Naval Hospital, Washington, D. C., will represent the Navy at both meetings. The Office of Civilian Defense will be represented at the Minneapolis meeting by Dr. Wallace Hunt, Omaha, medical officer, Seventh Civilian Defense Region, and at the Madison meeting by Dr. John S. Coulter of Chicago, medical officer, Sixth Civilian Defense Region. Dr. Harold S. Diehl, member, directing board, Procurement and Assignment Service, will represent that service at the meeting in Minneapolis and Dr. Charles S. Phifer of Chicago, chairman, Sixth Corps Area Committee, will represent the Procurement and Assignment Service at the Madison meeting.

SEATTLE PREPARES

A total of 13,245 volunteers were ready for action with the medical service unit of the Seattle civilian protection division, Dr. M. S. Jared, chief of the unit, announced on March 23. Of these, 11,215 are fully trained and the others are in training. Casualty stations have been organized in schools in each of the air raid zones of Seattle with surgeons, nurses and first aid workers assigned to each zone. Twenty-five ambulances also are assigned to each zone, and first aid workers are being formed into squads to be stationed at drug store first aid posts. A mobile hospital unit is ready for emergencies. Preparations are being made to establish a blood plasma bank under the direction of Dr. Eugene Potter; funds have been appropriated for equipment, including eight freezing units each with a capacity of 500 pints.

NEW JERSEY ORGANIZES EMERGENCY UNITS

Emergency medical units have been organized in five hundred and fifteen of the five hundred and sixty-eight municipalities in New Jersey, according to Dr. C. H. Schlichter, state chief of Emergency Medical Services, the Newark *Evening News* reports. The remaining fifty-three places without units are small communities having no physicians. Seventy-four of the eighty-six general hospitals in New Jersey have organized and equipped units for transporting, treating and providing bed space for victims of air raids and other emergencies. The privately formed first aid and rescue squads for public service have been increased from one hundred and twenty to one hundred and forty and in the last seven months the Red Cross has trained thirteen thousand persons in first aid. It was also announced that the State Laundry Owners Association has made three thousand, eight hundred trucks available for use as ambulances.

DR. ROBERT H. IVY ADDRESSES MEDICAL OFFICERS

The March meeting of the medical department officers residing in Washington and vicinity was addressed on March 16 at the Army Medical Center by Dr. Robert H. Ivy, Philadelphia, on "The Repair of Bony and Contour Deformities of the Face."

PROTECTION OF NEW YORK WATER SUPPLIES

The state of New York has been divided into twenty-three zones for the operation of the state's mutual aid water plan devised for the purpose of preparing each local water authority to meet fully any possible water supply emergency that may arise. Earl Devendorf, state coordinator of water supply, announced recently. A water works official has been appointed as zone coordinator of each one of the twenty-three zones, and district engineers of the state department of health and the sanitary engineers of Nassau, Suffolk and Westchester counties, which constitute separate zones, have been appointed assistant zone coordinators. The program calls for measures aimed at the protection of water supplies, reinforcement of weaknesses of water systems, bringing public water supplies to the highest possible level of operating efficiency, specific planning for emergency operations, and a mutual aid arrangement whereby any community in distress may be supplied promptly with assistance from adjoining or neighboring communities.

APPOINTMENTS TO ILLINOIS COUNCIL OF DEFENSE

Six members of the Illinois Department of Public Health have been appointed as a war measure by Governor Green to serve in various capacities with the State Council of Defense. Dr. Roland R. Cross, director of the department, will act as chief of the Emergency Medical Services in Civilian Defense, with Dr. H. L. Pettitt serving as his assistant. Dr. Pettitt, who is assistant director of the state health department, will serve also as emergency medical service coordinator of the Civil Protection Committee. Mr. C. W. Klassen, chief sanitary engineer of the state health department, has been appointed chairman of the sanitation division of the Defense Council's health committee. Miss Maude Carson, chief public health nurse of the state, will act as chairman of the nurses' advisory committee in the civilian defense effort. Dr. C. F. Deatherage, chief of the health department's dental division, will be a member of the dental advisory committee. Dr. Herman M. Soloway, the state's venereal disease control officer, has been made a member of the medical advisory committee, under the chairmanship of Dr. Charles H. Pfifer, president of the Illinois Medical Society.

MEDICAL AND SURGICAL RELIEF COMMITTEE

In keeping with its policy of giving first consideration to our own country's requirements, the Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York City, has offered to hold all donated supplies for final disposition by the Surgeon General, in the meantime continuing the work of collecting, selecting, reconditioning and redistributing the supplies to recognized relief agencies in America and allied nations.

The committee has recently presented seven emergency medical field sets to New Jersey hospitals and three emergency medical field sets to the Third Naval Base at Bayonne, N. J.

The largest amount ever contributed to the committee in a single month was received during February. Of the total of \$44,701.46, there was earmarked \$27,244.55 for the Free Norwegians, the Free French and the Chinese.

TEMPORARY BRIGADIER GENERALS

Col. James E. Baylis, Medical Corps, U. S. Army, has been promoted to the temporary grade of brigadier general. General Baylis is in command of the medical replacement training center at Camp Joseph T. Robinson, North Little Rock, Ark.—Col. George C. Dunham, Medical Corps, U. S. Army, also has been promoted to the temporary grade of brigadier general and, as previously stated, is to head a mission to Ecuador to undertake malaria control, improvement of sewage disposal and other sanitary measures in cooperation with the Ecuadorean government.—Brig. Gen. Raymond F. Metcalfe, who retired last year, has returned to active duty in the grade of colonel and assigned to surgeon of the Port of Embarkation of San Francisco.

CLASS OF AVIATION MEDICAL EXAMINERS

The following class of aviation medical examiners was graduated on March 28 at the School of Aviation Medicine, Randolph Field, Texas, following a course of study which began January 5:

Capt. John M. Adams	1st Lieut. Arthur E. MacNeill
1st Lieut. Lambert J. Agin	1st Lieut. Stephen L. Magness
1st Lieut. Osmund H. Akre	1st Lieut. John J. Manning
1st Lieut. Martin M. Alexander	1st Lieut. Harry E. Mantz
1st Lieut. Olaf W. Allison	1st Lieut. Samuel H. Marder
Capt. Robert C. Anderson	1st Lieut. George J. Merriman
Major Royal S. Anspach	1st Lieut. Abe Mickal
Capt. Max B. Backer	1st Lieut. John A. Moran
1st Lieut. John D. Barker	Capt. Paul F. Mueller
Capt. Karl L. Bergener	1st Lieut. Harold D. Munal Jr.
Capt. George C. Bess	1st Lieut. Irving Nelson
Major Marshall M. Best	1st Lieut. Robert H. Newell
1st Lieut. John F. Blalock Jr.	1st Lieut. Robert E. Nueruberger
1st Lieut. Richard M. Block	Capt. Leroy H. Oetjen
1st Lieut. Herbert N. Boden	Capt. Ernest B. Oliver
1st Lieut. Charles W. Braselton Jr.	1st Lieut. Albert Owers
1st Lieut. George M. Campbell	Capt. Wilmer H. Paine
1st Lieut. Kenneth D. Campbell	1st Lieut. Alvin L. Perry
1st Lieut. William H. Carter	Capt. Robert R. Pinger
Capt. Frank Clearly	1st Lieut. Ross G. Randall
Capt. Felix H. Crago	Capt. Merrill J. Reel
1st Lieut. William Davis	Capt. Francis Z. Reinus

"CABULANCES" AND "SNIFF" SETS FOR WASHINGTON, D. C.

The Army Chemical Warfare Service began the delivery of seventy-five sets of "gas sniffers" on March 28 to the air raid service, Washington, D. C., according to Clement Murphy, the chief air raid warden. These sets, according to the *Times Herald*, are expected to be of help in instructing wardens in the identification of war gases and in gas decontamination.

The District of Columbia's first mass demonstration of the use of taxicabs equipped with stretchers—"cabulances"—took place on March 27. More than a hundred cabs picked up emergency squads of doctors, nurses and nurses' aides at eighteen hospitals, and, after unloading, continued to pick up "bomb victims" and take them to the hospitals. The work of the "cabulances" was supplemented by delivery trucks, also equipped to carry stretchers.

REPLACEMENT TRAINING CENTER MOVED

The Medical Department Replacement Training Center at Camp Lee, Va., will be moved about June 1 to Camp Pickett, Va., thus freeing the entire reservation at Camp Lee for the use of the Quartermaster Corps. According to the *Army and Navy Journal* Brig. Gen. William R. Dear, M. C., will remain in command of the Medical Department Replacement Center when it moves to Camp Pickett, where training facilities will have a greater capacity than at Camp Lee.

MOBILE RED CROSS UNITS

The War Production Board has granted priority ratings to the American Red Cross for the construction of limited numbers of ambulances, mobile canteens and disaster relief units. In the design of these units, consideration was given to the study made by the Red Cross observers of disaster relief in Great Britain during the heavy German bombings and of civilian mass feeding. Construction of these new Red Cross units, Chairman Norman H. Davis said on March 17, is necessary because of the increased threat of enemy bombing over American soil and because the Red Cross cannot apply to the armed forces for extra equipment during wartime as it could in peacetime. The equipment will comprise two types of 1 ton mobile canteens similar to those used in Great Britain, a 1½ ton mobile canteen, a custom built body for canteen service suitable for mounting on different types of chassis, an all service mobile disaster relief unit and five army type ambulances. The custom built canteen can feed civilian disaster victims from four windows, whereas the average canteen has but two windows for service.

Many Red Cross chapters, Mr. Davis announced, have received offers from civic groups and individuals to contribute to the purchase of this equipment. Prices for the mobile units range from about \$1,300 to \$3,000.

NEGRO MEDICAL OFFICERS GRADUATE AT CARLISLE BARRACKS

Twenty-two Negro officers of the medical department were graduated from the Medical Field Service School of the army at Carlisle Barracks, Pa., April 4, after four weeks' training for duty in the medical battalion of a new division. The special course completed was designed to prepare officers for the particular assignments they will have in the medical battalion. The twenty-two officers called to duty from civil life are all first lieutenants in the Army of the United States, eighteen being medical and four dental officers, representing thirteen states and the District of Columbia.

This class brought to a total of fifty-one the number of Negro officers and enlisted men graduated from the Medical Field Service School since a state of emergency was declared by President Roosevelt. The class graduating on April 4 was composed exclusively of Negro officers; ordinarily Negro officers are members of the regular classes.

The roster of the officers in the class which graduated on April 4 is as follows:

MEDICAL CORPS

Orion T. Ayer, Gainesville, Fla.
James A. Brown, Hopewell, Va.
Henry C. Bryant, North Birmingham, Ala.
Albert C. Burwell, Baltimore.
Jesse S. Chandler, Nashville, Tenn.
Lincoln B. Childs, Gainesville, Fla.
Henry I. Davis, Galveston, Texas.
Albert H. Dyson, Dallas, Texas.
Luther J. Lemon, McDonough, Ga.
Charles L. Lomack, Washington, D. C.
Rudolph H. Porter, Austin, Texas.
William B. Price, Fayetteville, N. C.
Harry L. Riggs, Detroit.
Benjamin W. Satterfield, St. Louis.
Lincoln W. Shumate, Washington, D. C.
William B. Smith, Indianapolis.
Roger G. Thurston, Washington, D. C.
Harold H. Whitted, Washington, D. C.
Oney M. Whittier, San Antonio, Texas.

DENTAL CORPS

Paul S. Binford, York, Pa.
Elbert L. Booke, New York.
Emmett I. Brown, Indianapolis.

MEDICAL AREAS FOR MUTUAL ASSISTANCE

Following a meeting of state coordinators in Seattle the north-west counties of Washington will form immediately medical areas for mutual assistance in case of war emergency. According to the Bellingham Herald, coordinator W. J. Kaigler said on his return from the meeting that county representatives met on March 18 at Bellingham to check resources and designate medical areas so that one area may draw from another, if necessary.

MEDICAL DEPARTMENT PROMOTIONS

According to the *Army and Navy Journal*, the following majors of the medical corps were promoted in March to be lieutenant colonels:

Leon L. Gardner
Arthur B. Welsh
Martin E. Griffin
Alvin L. Gorby
Frank B. Wakeman
Paul I. Robinson

Silas B. Hays
Karl R. Lundbert
William S. Stone
Thomas Neilson Page
Joseph H. McNinch

The following captains of the medical corps were promoted to the grade of major:

Bryan C. T. Fenton
Charles H. Moseley
James T. McGibony
John K. Davis
Louis F. Hubener
Lee P. Mayes
Daniel J. Sheehan

Earl C. Lowry
John J. Pelosi
Theodore C. Bedwell Jr.
Richard Reynolds
Robert J. Goldson
Aaron L. Kaminsky

INSTRUCTION IN TROPICAL MEDICINE FOR ARMY OFFICERS

Between Aug. 1, 1941 and Jan. 1, 1942 one hundred and eight officers of the Medical Corps of the Army graduated from the course in tropical medicine at the Army Medical School, Washington, D. C. Twenty-four additional officers graduated late in February following the two months course. Among those who lectured to this class were Rear Admiral E. R. Stitt, U. S. Navy, retired, Drs. Charles Armstrong, R. E. Dyer, Edward Francis, L. L. Williams Jr. and W. G. Workman of the U. S. Public Health Service and Dr. F. C. Bishopp of the U. S. Department of Agriculture. A new class with about the same number of officers in attendance took up the course on March 2.

LOS ANGELES PREPARES FOR CIVILIAN CASUALTIES

At a joint meeting of the hospital committee of the Los Angeles city and county defense councils on March 27 a plan was announced that provides four thousand five hundred emergency hospital beds in case of need of medical service. At that time a sufficient quantity of blood plasma was needed, but it would be provided within a few weeks, the county health officer is reported to have said. There will be nearly two hundred casualty stations in Los Angeles County, each stocked with medical supplies.

STATE HOSPITAL AVAILABLE FOR CHRONIC CASES

Mayor F. H. LaGuardia, according to the New York Herald Tribune, has received assurance from Governor Herbert H. Lehman that the facilities of the Willow Brook State Hospital on Staten Island will be available for chronic cases transferred from city hospitals to make room for casualties in the event of enemy action against New York City. When the hospital is completed, it will accommodate between three and four thousand persons.

CHIEF OF VETERINARY CORPS PROMOTED TO BRIGADIER GENERAL

The Senate confirmed on March 7 President Roosevelt's nomination of Col. R. A. Kelsner, chief of the U. S. Army Veterinary Corps, for the rank of brigadier general. Dr. Kelsner entered the Army as a second lieutenant in the veterinary section of the officers' reserve corps in June 1917 and has advanced through the various grades since that time.

MILWAUKEE PREPARES FOR EMERGENCIES

The Milwaukee Journal states that 1,056 physicians, nurses, first aid workers and others were being recruited in March to man one hundred and eight first aid posts, casualty stations and base hospitals for war emergencies in Milwaukee County, according to Dr. H. W. Sargeant, chief of the emergency medical service. In addition, four mobile first aid stations had been completed, ambulances had been assigned and control telephone lines installed.

ORGANIZATION SECTION

REPORTS OF OFFICERS

NOTE.—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc., and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion.—Ed.

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Secretary is respectfully submitted:

MEMBERSHIP

The official membership list of the American Medical Association as of April 1, 1942 included the names of 120,701 physicians as compared with 118,441 enrolled members on the corresponding date in 1941. The deaths of 1,824 members were recorded in 1941.

The usual tabulation pertaining to the organization of constituent state and territorial medical associations, the total number of counties, the number of component county medical societies, the number of unorganized counties and the number of physicians as shown by the latest available information is included as a part of this report. The accompanying table also reflects the number of members on April 1, 1941 and on April 1, 1942 as reported by each constituent state and territorial medical association and the number of Fellows in each state and territory. It is possible that there may be a slight difference in the number of members as shown by the official records of an individual constituent association and the number presented in the accompanying table, largely for the reason that official reports may have been unavailable at the time the table was prepared.

FELLOWSHIP

The official Fellowship roster carried 73,747 names on April 1, 1942 as compared with 72,504 on the same date in 1941.

During the year the deaths of 836 Fellows were reported to the Secretary's office.

ANNUAL CONFERENCE OF SECRETARIES OF CONSTITUENT STATE MEDICAL ASSOCIATIONS

The regular Annual Conference of Secretaries of Constituent State Medical Associations was held in the Assembly Room of the Association's building in Chicago on Nov. 14 and 15, 1941 and was attended by nearly all the state secretaries and editors of state medical journals, as well as by a goodly number of officers and members of official bodies of constituent associations and component societies. One entire section of the program of the conference and a part of another section were devoted to discussions of various phases of the national defense program and of the relations of physicians with the military forces.

THE AMERICAN MEDICAL ASSOCIATION AND THE WAR

As will be shown in several official reports to be submitted to the House of Delegates, the American Medical Association has attempted to discharge fully its duty to the nation and to medicine during the emergency created by the world war. Every elected officer of the Association, many members of its official bodies and a large part of its administrative personnel have been almost continuously engaged in activities, designed to be helpful to official governmental agencies, pertaining directly to the national defense program. A large part of the time of the Secretary and his office staff has been devoted to such duties.

SUBMISSION OF MEMORIALS AND RESOLUTIONS

Several communications have been received during the past year from members of the House of Delegates and from others suggesting and in some instances demanding that memorials

and resolutions to be submitted to the House at an annual session should be sent to the Secretary in time for them to be printed in the Handbook of the House of Delegates. This matter is respectfully submitted to the House of Delegates for such consideration as the House may believe to be indicated.

PROPOSED AMENDMENT TO THE CONSTITUTION

The following resolution containing a proposed amendment to the Constitution was presented to the House of Delegates at the Cleveland session in 1941, and, in accordance with the provisions of the Constitution, the amendment proposed in the resolution will be before the House of Delegates for action at the Atlantic City Session:

WHEREAS, The Board of Trustees of the American Medical Association was set up at a time when numerically the Association was approximately one-third its present strength; and

WHEREAS, Because of the great variety of conditions existing throughout the country, largely because of geographic and population problems, it seems desirable to provide a greater spread of membership for the Board, even though it is not at all a matter of representation in the sense that the House of Delegates is a representative body; therefore be it

Resolved, That article 6, section 1 of the Constitution of the American Medical Association be amended by substituting the word "eleven" for the word "nine" as the last word of the fourth line of that section, so that article 6, section 1, will then read: "SECTION 1.—The general officers of the Association shall be a President, a President-Elect, a Vice President, a Secretary, a Treasurer, a Speaker and a Vice Speaker of the House of Delegates, and eleven Trustees"; and be it further

Resolved, That article 6, section 3 of the Constitution of the American Medical Association be amended to read as follows:

"SEC. 3.—Two Trustees shall be elected annually except every fifth year, when three shall be elected, each to serve for five years, or until his successor is elected and installed: *Provided*, that at the session of the House of Delegates at which this amendment is adopted three Trustees shall be elected to serve five years and one to serve four years. No Trustee shall serve for more than two consecutive terms, but a Trustee elected to serve an unexpired term shall not be regarded as having served a term unless he has served three or more years."

SUSPENSION OF PAYMENT OF DUES BY PHYSICIANS IN MILITARY SERVICE

A large number of communications have been received from physicians who have been called to active duty with the military forces of the nation pertaining to the suspension of payment of Fellowship dues.

It appears that a number of constituent state medical associations and a much larger number of component county medical societies, by the adoption of resolutions or under authorization provided in their by-laws, have suspended the payment of membership dues in whole or in part by members who have been assigned to active duty. As there is no provision whatever in the Constitution and By-Laws of the American Medical Association for the suspension or remittance of Fellowship dues, the Secretary has been compelled, in replying to communications of the nature aforementioned, to state that no such authorization exists.

There seems to be some confusion in the minds of many members with respect to dues paid to the American Medical Association. No member of the American Medical Association as such is required to pay dues to the American Medical Association, nor does any part of membership dues paid to component county medical societies or constituent state or territorial medical associations accrue to the American Medical Association. Only those members who have qualified as Fellows of the American Medical Association are required to pay dues to the Association.

IN APPRECIATION

This session of the House of Delegates marks the twentieth year in which the present incumbent has served as Secretary of the American Medical Association. As in each previous year, an expression of grateful appreciation is offered to the members of this House, to all the officers of the Association and members of its administrative personnel and to the officers and members of state and territorial medical associations and county medical societies for the kindly consideration, assistance and encouragement extended to the office of the Secretary.

Respectfully submitted.

OLIN WEST, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association:

The Board of Trustees respectfully submits to the House of Delegates the following report pertaining to the general affairs of the Association and to the activities of its various councils, bureaus and departments during the past year. Reports of those councils that are standing committees of the House of Delegates will be separately submitted.

The usual quarterly meetings of the Board of Trustees and the usual monthly meetings of the Executive Committee of the Board were held. At various times during the year representatives of other organizations have conferred with the Board of Trustees or with its Executive Committee. At these conferences matters of important interest to the organizations represented and to the whole cause of American medicine have been considered. Recently an important conference participated in by the Executive Council of the Association of American Medical Colleges and the members of the Council on Medical Education and Hospitals and of the Board of Trustees of the American Medical Association was held in Chicago. As a result of this conference, committees were appointed to represent the Executive Council of the Association of American Medical Colleges and the Council on Medical Education and Hospitals for the purpose of outlining plans for establishing more complete cooperative relations between these two important groups.

It is not possible to include in the annual report of the Board of Trustees reference to all the many and varied problems that come before this body for consideration. Many matters not referred to in this report have received the official attention of the Board and final disposition has been made. Many other matters that have been presented to the Board have not required official action or are still under consideration.

The general officers of the Association, including the President, the President-Elect, the Vice President and the Speaker of the House of Delegates, have attended most of the meetings of the Board of Trustees and have actively participated in the consideration and discussion of matters requiring attention. The Board of Trustees greatly appreciates the active interest and the helpful counsel of these officers.

Income and Expenditures

On the recommendation of the auditors of the Association, some changes have been made in accounting methods so that in the future the valuation of property and equipment will be made on the basis of costs. The reserves that were heretofore created will be continued and a depreciation reserve will be reflected in the annual reports submitted by the auditors. The Report of the Auditor and the Report of the Treasurer for the year ended Dec. 31, 1941 are submitted as a part of this report of the Board of Trustees.

Gross income from all sources for the year ended Dec. 31, 1941 amounted to \$1,939,127.39, representing an increase of \$62,773.59 above the gross income for the previous year. Total expenditures amounted to \$1,715,779.75, an increase of \$27,194.25 over the total expenditures for the previous year.

Fellowship dues and subscriptions were received in the amount of \$795,460.48, which is the largest income that has ever been produced from these sources and which exceeds income similarly derived for the year 1940 by the sum of \$19,258.04. Since it is certain that thousands of physicians will be called into service as medical officers of the Army and Navy and of other federal agencies, it is possible that income to be derived from Fellowship dues and subscriptions to the Association's publications may be materially reduced for the current year and for each year during the continuation of the great world war.

Income received from advertising in the Association's publications for which advertising is accepted amounted to \$1,009,853.96, which exceeds the highest income produced from this source heretofore by the sum of \$3,735.82 and is greater by the sum of \$40,272.71 than income received from advertising in the preceding year.

Interest received on investments in 1941 amounted to \$77,424.09 as compared with \$80,571.91 received from the same source in 1940. The shrinkage in income received from this source has continued over a period of several years because of a general

reduction in interest rates and inability to replace securities that have matured or have been called with other securities of equal yield, and also because of the difficulties involved in making satisfactory investments. It is the policy of the Board of Trustees to invest the funds of the Association available for investment with a view to security rather than with a view to securing greater interest returns. The face value of securities held in the Association's portfolio that are in default or partially in default of interest payments amounts to \$43,400. The accumulated unpaid interest on defaulted and partially defaulted bonds as of Dec. 31, 1941 amounted to \$4,620.

The net income for the year 1941 as shown by the Report of the Auditor was \$223,347.64, of which amount \$77,424.09 was interest on investments.

The amount expended for paper used in the publication of THE JOURNAL in 1941 was \$260,190.99 as compared with an expenditure of \$230,775.35 in the preceding year. The cost of paper advanced steadily through the year covered by this report, but the full import is not reflected in the figures here presented for the year 1941 for the reason that not all of these increases were effective during the entire year. It is possible and perhaps very probable that additionally increased prices may become effective during the current year. An earnest effort is being made to avoid wastage and otherwise to conserve paper supplies.

Total expenditures for wages and salaries applicable to THE JOURNAL account for the year ended Dec. 31, 1941 amounted to \$540,800.30, as compared with expenditures of \$504,564.69 for the preceding year. This increase does not reflect to the fullest extent the higher wage rates which became effective on various dates during the year for different groups of workers, and it is possible that further adjustments will have to be made during the present year. Because of higher costs of living and because of a tremendously increased demand for office personnel, it became necessary to make numerous salary adjustments and to employ additional personnel in some departments, especially in those concerned with the preparation and publication of a new edition of the American Medical Directory and with the work incident to the maintenance of cooperation with the government in the national defense program. For the first time in many years, great difficulty has been experienced in maintaining the necessary working personnel because of the tremendous demands of federal agencies and industries of the nation. These difficulties seem to be increasing rather than diminishing. The cost of practically all materials used by the Association has grown larger, and in some instances increases in costs have been considerable in amount.

Expenses involved in the maintenance of various councils, bureaus and committees of the Association amounted to \$460,513.58 as compared with expenditures of \$482,510.35 in the preceding year. The reduction in such expenditures is in part due to losses in personnel that, in some instances, it has not yet been possible to replace satisfactorily and the consequent suspension of payment of salaries or wages. When existing vacancies can be satisfactorily filled, the decrease in expenditures for the maintenance of these official agencies of the Association will not recur.

Legal and investigation expenses in 1941 amounted to \$119,183.19, as compared with \$112,345.16 in 1940.

A building formerly used for storage purposes, which did not provide adequate space and was not so constructed as to permit the storage of heavy supplies, and an old residence building that has been utilized for some years were razed during the year, and a new storage building has been erected adjoining the main building of the Association. This new building is three stories in height and is so constructed that, if it becomes necessary, additional stories can be added. The cost of this building, which is not yet altogether completed, will be approximately \$215,000.

The buildings and other properties of the Association have been well maintained, and all possible effort has been exerted to effect and maintain economies to a degree that will not interfere with efficient operations.

The number of employees at the time of preparation of this report was six hundred and forty-four, and the Board of Trustees desires to acknowledge with gratitude the faithfulness, efficiency and loyalty of those in its service. A considerable number of employees in the office forces and in the mechanical

departments have been in the service of the Association for from fifteen to thirty-five years and, in a few instances, for even longer periods.

Summary

Gross income from all sources for the year 1941 amounted to \$1,939,127.39, representing an increase over the preceding year of \$62,773.59. Income received from Fellowship dues and subscriptions was \$795,460.48, exceeding income from the same source in 1940 by the sum of \$19,258.04. Income from the sale of advertising space was \$1,009,853.96, exceeding that received in the previous year by \$40,272.71. Interest received on investments in 1941 amounted to \$77,424.09 as compared with a similar income in 1940 of \$80,571.91. The face value of defaulted or partially defaulted bonds amounted to \$43,400, and the accumulated unpaid interest on such bonds was \$4,620. The cost of paper used in the publication of THE JOURNAL was greater in 1941 than in the preceding year by the sum of \$29,415.64. Expenditures incident to the operation of the various councils, bureaus and departments of the Association were \$460,513.58, approximately \$22,000 less than in the preceding year. Expenditures for legal services and investigations amounted to \$119,183.19 as compared with expenditures for the same purposes in 1940 of \$112,345.16. A new storage building, not yet completed, was erected during the year and will cost the Association approximately \$215,000. Net income for 1941 as shown in the Report of the Auditor was \$223,347.64, of which \$77,424.09 represented interest on investments. At the time of preparation of this report there were six hundred and forty-four persons in the employ of the Association.

The Journal of the American Medical Association

The amount of material published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION has become so great that the Board of Trustees has determined to issue three volumes annually with an index in April, August and December in order to provide for bound volumes that can be of more easy use in libraries and for other purposes.

During the year modifications have been instituted making possible the use of special announcements on the cover of THE JOURNAL concerning important activities related to the war. These bulletins have met with wide approval from the medical profession.

The title of the section of THE JOURNAL devoted to Medical Preparedness has been changed to Medicine and the War. Complete cooperation from the Army, the Navy, the United States Public Health Service, the Procurement and Assignment Service, the Office of Civilian Defense, the Office of Defense Health and Welfare Services, the Selective Service System and, indeed, every other governmental agency has enabled THE JOURNAL to serve as an important medium with respect to keeping the medical profession aware of its responsibilities and its duties in relation to the war.

Special articles on the use of the United States Pharmacopoeia, on glandular physiology and therapy and on many other topics have been received by physicians with approval.

THE JOURNAL continues to serve as a medium for reports of the official bodies of the American Medical Association. Special sections devoted to the work of the Council on Pharmacy and Chemistry, the Council on Physical Therapy, the Council on Foods and Nutrition, the Committee on American Health Resorts, the Committee to Study Air Conditioning, the Council on Industrial Health, the Council on Medical Education and Hospitals and many other bodies have been of immense value to the medical profession.

The war continues to interfere seriously with the receipt of correspondence and medical periodicals from foreign countries, although letters are received regularly from London and occasionally from France and Switzerland. In the meantime, arrangements have been made to cooperate with governmental agencies in promoting interchange of scientific work with the Latin American nations. THE JOURNAL now has regular correspondents in Buenos Aires, Argentina; Rio de Janeiro and

São Paulo, Brazil; Santiago de Chile; Havana, Cuba, and Mexico City. Through cooperation with the American Library Association, arrangements are being completed whereby interchange of scientific publications even with the warring nations will be facilitated. This will, of course, add to the material utilized in the Current Medical Literature department of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.

The Organization Section of THE JOURNAL has been especially devoted to consideration of modifications that have been developed in plans for wider distribution of medical service and of hospitalization. The factual data thus made available are of the utmost importance in guiding the development of such services.

The number of subscribers to THE JOURNAL continues to increase, although it is anticipated that the entrance of considerable numbers of physicians into military service may have a somewhat adverse effect on the circulation, at least temporarily.

Table 1 accompanying this report indicates the number of Fellows and subscribers on the mailing list of THE JOURNAL in each state and territory on Jan. 1, 1942 and also shows the number of Fellows and subscribers in other countries, the number of copies of THE JOURNAL sent to advertisers and subscription agents and the number sent as exchange or complimentary copies.

Table 2 shows the number of physicians in each state as indicated by the Sixteenth Edition of the American Medical Directory, the number of physicians in each state who receive THE JOURNAL and the approximate percentage of such physicians.

The net paid weekly average circulation in 1941 was 100,027 as compared with 98,002 in 1940. The delivery of material to some foreign countries has been entirely suspended, resulting in a reduction of the number of foreign subscribers. The total number of copies of THE JOURNAL printed in 1941 was 5,350,113.

Summary

The amount of material published in The Journal has become so great that it has been determined to issue three volumes annually with indexes in April, August and December.

During the year modifications were instituted, so that special announcements concerning important activities connected with the war now appear at intervals on the front cover. The title of the Medical Preparedness Section of The Journal has been changed to Medicine and the War. The close cooperation that has been maintained with practically every governmental agency has

* This table gives the number of physicians (based on the Sixteenth Edition of the American Medical Directory) in the United States, the number receiving THE JOURNAL, and the approximate percentage in each state. Copies sent to the United States Army, Navy and Public Health Service are included.

enabled The Journal, through the publication of material in this section, to serve as an important medium for keeping the medical profession aware of its responsibilities and duties in relation to the war.

Special articles on many topics of immediate and important interest to the medical profession as well as reports prepared by the various official bodies of the Association were published during the year and were received with approval.

The war continues to interfere seriously with the receipt of medical periodicals from foreign countries, but through cooperation with the American Library Association it is probable that interchange of scientific publications will be facilitated, which will add to the material utilized in the Current Medical Literature department of The Journal. Arrangements have been made to cooperate with governmental agencies in promoting the interchange of scientific work with the Latin American countries.

Material published in the Organization Section of The Journal has proved to be of the utmost importance in guiding the development of plans for wider distribution of medical service and hospitalization.

The net paid weekly average circulation of The Journal in 1941 was 100,027, and the total number of copies printed was 5,350,113.

Special Journals

The special journals published by the Association have been continued with the scientific and editorial standards that have made them leaders in their field.

Because of conditions created by the national defense effort it was thought to be the part of wisdom to reduce the size of the special journals to some extent, so that the amount of scientific material which appeared in the pages of these publications was considerably less in the year covered by this report than in the preceding year and probably will continue to be less.

The special symposiums featured in the ARCHIVES OF SURGERY, which have concerned the abdomen and the bones and joints, have attracted much favorable attention. Also of significance have been the collective reviews which constitute one of the most important features of the ARCHIVES OF INTERNAL MEDICINE. Repeated requests have been received for reprints of these collective reviews.

The total number of subscribers to the special journals, not including WAR MEDICINE, in 1941 was 26,740 as compared with 26,356 in 1940. Two of the periodicals in this group showed a loss in the number of subscribers, these being the ARCHIVES OF SURGERY and the AMERICAN JOURNAL OF DISEASES OF CHILDREN, while each of the other special journals showed an increase.

Two of the special journals, namely the AMERICAN JOURNAL OF DISEASES OF CHILDREN and the ARCHIVES OF OPHTHALMOLOGY, showed an excess in income received over the cost of publication in 1941 as they did in 1940, the gain this year being considerably above that of last year. The ARCHIVES OF SURGERY showed a gain in 1941 of \$436.73 as against a loss in the preceding year of approximately \$6,750. The total loss incurred in the publication of the special journals in 1941, including that incident to the publication of the new journal, WAR MEDICINE, was less than the loss sustained in the preceding year by the sum of \$18,482.24.

War Medicine

WAR MEDICINE, established in January 1941, has been recognized as significant by the Army and Navy medical departments and by the United States Public Health Service. It has published material dealing with every aspect of the war effort.

The Division of Medical Sciences of the National Research Council indicated recently the desirability of making this a monthly publication. However, complicating factors from the point of view of publication have temporarily delayed such action.

The abstracts in WAR MEDICINE have been an especially useful contribution and are being widely reprinted in British and Canadian publications. Incidentally, all this material is made available, in advance of publication, to the Medical Research Council of Great Britain.

WAR MEDICINE is now widely recognized as a notable contribution of the American Medical Association toward national defense.

The cost of publication of this periodical during its first year was slightly in excess of income received.

Hygeia

Constant effort has been made to effect improvements in the quality of material appearing in the columns of HYGEIA and to publish articles and editorials of timely interest, authentically informative in character. There seems to be no doubt that the reader interest in this magazine has definitely increased. A considerable number of articles originally published in HYGEIA have been reprinted in the *Reader's Digest*, a publication with a large circulation, and articles and editorials have been widely quoted in lay publications throughout the country.

The average monthly circulation of HYGEIA was well maintained during the year covered by this report, having been in excess of 100,000 copies. There was an increase in the percentage of subscription renewals as compared with the previous year.

The fine support of the Woman's Auxiliary has played an important part in introducing HYGEIA to new readers and in making it available to public and semipublic institutions in various communities. Through the efforts of the auxiliaries, HYGEIA has been placed in a considerable number of schools and hospitals and in reading rooms of women's clubs and other organizations. Most highly commendable was the effort of the Woman's Auxiliary to the Medical Society of the State of Pennsylvania, which resulted in placing HYGEIA in every junior and senior high school in that state.

The advertising income of HYGEIA was in some instances unfavorably affected by the prevailing uncertainties in business and industry. Some advertising contracts were canceled and in some instances the amount of space used by advertisers was reduced, but these losses were more than met by the amount of new advertising secured.

Total income received from all sources for the fiscal year covered by this report was \$266,172.38, while total expenditures for the same period amounted to \$250,434.32. It is gratifying to report that for the first time in several years HYGEIA credits were greater than debits, in the sum of \$15,738.06.

An actual count made in December 1941 showed that the total number of subscribers at the time the count was made was 114,000, distributed among 15,543 physicians and 98,457 others.

Summary

Constant effort was made during the year covered by this report to improve the quality of material appearing in Hygeia, and reader interest definitely increased. Articles and editorials from the columns of this magazine have been widely quoted and reprinted in lay publications. The Woman's Auxiliary to the American Medical Association and its state auxiliaries have continued their fine work in introducing Hygeia to new readers and in placing the magazine in schools, hospitals and reading rooms of many organizations.

The average monthly circulation during 1941 was in excess of 100,000 copies, and there was an increase in the percentage of subscription renewals. The total number of subscribers by actual count in December 1941 was 114,000, distributed among 15,543 physicians and 98,457 others.

While advertising income in some instances was curtailed, the loss thus incurred was more than met by new advertising secured. For the first time in a number of years credits exceeded debits, by the sum of \$15,738.06 for the year 1940.

Press Relations

The effectiveness of the press relations activities of the Association, carried on under the supervision of the Editor of THE JOURNAL, is testified to in numerous unsolicited comments by disinterested persons.

Under the heading "A. M. A. Press Releases" the world famed daily newspaper *Greenwich Time*, in an editorial in its issue of April 21, 1941, declared that "Whatever may be the faults of the American Medical Association . . . it has an excellent public relations department. From Chicago come frequent and readable stories of the progress of medicine, which let us know that each succeeding time we get sick we've got a better chance of getting well. . . ."

In a recent letter to the Editor of *THE JOURNAL* the managing editor of the Miami (Fla.) *Herald* made the following unsolicited statement: "I should like to take this occasion also to tell you how valuable I have found the American Medical Association news releases to be. Such material as we have used always has found a healthy reader response. . . ."

Despite the space limitations in newspapers because of the exigencies of war, the number of stories based on articles appearing in *THE JOURNAL* and in *HYGEIA* which were used in American newspapers in 1941 exceeded that of 1940. During the past year more than eighty-one thousand such stories were published in the daily press of the United States in addition to a large number of feature stories and editorials based on information published or furnished by the Association. Of particular importance among the developments of 1941 was the large increase in the number of weekly newspapers using stories based on releases furnished by the Association. Newspaper stories and radio announcements are based on information released weekly through the *AMERICAN MEDICAL ASSOCIATION NEWS*, which contains abstracts of articles and announcements appearing in the various periodicals of the Association. In 1941 special editions of the *AMERICAN MEDICAL ASSOCIATION NEWS* were inaugurated containing abstracts of articles and announcements appearing in *WAR MEDICINE*. The same mailing list is used for the regular and the special editions of the *AMERICAN MEDICAL ASSOCIATION NEWS* and includes three hundred and twenty-five daily newspapers, eighty-two news services, radio stations and miscellaneous publications, forty-three local and state health departments, fifty health and tuberculosis associations, seventy-seven county and local medical societies, fifty-three state and territorial medical societies, eighty-four national medical organizations, sixty-one pharmaceutical associations and manufacturing companies, forty-six industrial organizations, nineteen educational institutions and twenty-four science writers. In addition, eighty copies are sent weekly to various constituent state and territorial medical associations for distribution to smaller newspapers in their states. All names on the mailing list have been placed there by request. Particularly noteworthy, in view of the necessity of exercising rigid economy in publication costs as related both to materials and to other expense, is the fact that more than three thousand more newspaper stories based on articles in the *AMERICAN MEDICAL ASSOCIATION NEWS* were used in 1941 than in 1940 without any increase in the number of copies of the *AMERICAN MEDICAL ASSOCIATION NEWS* that were distributed.

The soundness of the press relations program of the Association was demonstrated again during the Ninety-Second Annual Session in Cleveland. During the five days of the session the three Cleveland daily newspapers devoted a total of 1,737 inches of space to the session as compared with 1,573½ inches of space in the eight major New York City newspapers during the 1940 session.

During 1941 the number of inquiries regarding the various phases of medicine received from newspapers and radio stations was in excess of three thousand one hundred as compared with approximately two thousand in 1940. A considerable portion of this increase is due to inquiries pertaining to various medical phases of the war and is in itself evidence of the wide acceptance of the Association as an authoritative source of information on medical matters.

Other activities of the press relations department have expanded considerably, especially with regard to the furnishing of articles and information for use in special publications such as industrial house organs and medical supplements published by local newspapers under the sponsorship of medical societies. The number of special newspaper supplements aided by the department in 1941 totaled twenty-two as compared to twenty-one in 1940 and fifteen in 1939.

The facilities of this department have been utilized extensively by the American Red Cross and by governmental agencies. The press facilities for such meetings as the Association's Annual Congress on Medical Education and Licensure and the Annual Congress on Industrial Health have been handled by this department, and special assistance has been given to several state and county medical societies in their press relation pro-

grams. The material for the Medical News page appearing in *HYGEIA* each month also is furnished by the press relations department.

In addition to the releases contained in the regular and special editions of the *AMERICAN MEDICAL ASSOCIATION NEWS*, numerous special releases have been issued during the year pertaining to such matters as contaminated drugs and other information which it was deemed necessary to bring to the immediate attention of the public.

Library

The Library of the American Medical Association during 1941 continued to be of service in every possible way to the various councils, bureaus and departments in the headquarters offices, to governmental agencies, to state and county medical societies and other professional organizations and to individual physicians from all parts of the country.

In 1941, 2,806 package libraries were distributed in response to requests received from every state and the District of Columbia, the Canal Zone, Hawaii and Mexico. The package library service, principally because of the excessive mailing costs, has not heretofore been made available to physicians residing outside the continental United States and Canada. Two hundred governmental agencies, including army medical posts, marine hospitals and naval training stations, were accommodated through the package library service. Sulfanilamide, industrial diseases, anesthesia, vitamins, tuberculosis, war and national defense problems and aviation medicine were among the subjects most frequently requested.

The Library maintains a periodical lending service, and 12,833 periodicals were lent in 1941 in response to requests received from physicians in all parts of the United States as well as from a number of military and governmental agencies.

Approximately 6,650 reference questions were answered by the Library in 1941 as compared with approximately 5,550 similar questions answered in the preceding year. While most of the reference questions are answered by mail, more than 1,200 visitors called in person for Library service.

Indexes for *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* were prepared in the Library during the year as usual, and in addition much work has been done on the preparation of an index for the new edition of the *Standard Classified Nomenclature of Disease*.

The Library retains the medical periodicals which it receives for a period of ten years, and each year those discarded are offered to various medical libraries through the Exchange Service of the Medical Library Association. In 1941 periodicals published in 1929 were distributed to fifty-five medical libraries.

Employees of the Association who took advantage of the opportunity to read the books and magazines made available through the Employees' Library for an annual fee of 50 cents numbered 117 in 1941.

QUARTERLY CUMULATIVE INDEX MEDICUS

The material available for indexing for the *QUARTERLY CUMULATIVE INDEX MEDICUS* was somewhat curtailed in 1941. Periodicals were received from abroad quite regularly until June 1941, but since that time no periodicals have been received from Germany, France or Italy. Several hundred issues were borrowed from a Chicago library which had been fortunate enough to receive them. Through the efforts of the Joint Committee on Importations of the American Library Association, many foreign periodicals now held in Bermuda that are addressed to scientific libraries in the United States will soon be released and the issues thus secured will be indexed in the 1942 edition of the *QUARTERLY CUMULATIVE INDEX MEDICUS*. Since all exchange relations with periodicals published in Germany, France, Italy, Japan, the Philippines, China, Belgium, Rumania, the Netherlands, Finland, Norway and Denmark have been canceled, much foreign literature will be unavailable in 1942. The effect that war conditions have had on the *QUARTERLY CUMULATIVE INDEX MEDICUS* is indicated by the fact that the total number of articles indexed from periodicals published in foreign languages for inclusion in the Index was 25,514 in 1939.

and 24,312 in 1941. It is anticipated, however, that the INDEX will be much more affected in 1942.

There were seventy-six fewer subscribers to the QUARTERLY CUMULATIVE INDEX MEDICUS in 1941 than in the preceding year, but the loss incurred in its publication was less than in 1940 by the sum of \$5,388.12.

Summary

The Library of the American Medical Association has continued to be of service in every possible way to the various councils, bureaus and departments in the headquarters offices, to governmental agencies, to state and county medical societies and other professional organizations and to individual physicians from all parts of the country.

In 1941, 2,806 package libraries were distributed to all sections of the United States and, for the first time since this service was inaugurated, to the Canal Zone, Hawaii and Mexico. During the year covered by this report, 12,833 periodicals were lent by the Library, approximately 6,650 reference questions were answered, more than 1,200 visitors who called in person for Library service were accommodated, books and magazines were circulated through the Employees' Library to 117 employees of the Association, and indexes for The Journal and the new edition of Standard Classified Nomenclature of Disease were prepared.

War conditions have had an unfavorable effect on the amount of material available for indexing in the Quarterly Cumulative Index Medicus. No periodicals have been received in the Library from Germany, France or Italy since June 1941, and all exchange relations with periodicals published in Germany, France, Italy, Japan, the Philippines, China, Belgium, Rumania, the Netherlands, Finland, Norway and Denmark have been canceled so that much foreign literature will be unavailable and the Index more seriously affected in 1942. Although there were fewer subscribers to the Quarterly Cumulative Index Medicus during the past year, the loss incurred in its publication was less in 1941 than in 1940 by the sum of \$5,388.12.

American Medical Directory

As of Dec. 31, 1941, 7,279 copies of the Sixteenth Edition of the American Medical Directory had been sold, as compared with the total sale of 7,315 copies of the Fifteenth Edition. As this report is being prepared, it seems probable that the total sales of the Sixteenth Edition will equal and possibly may slightly exceed those of the Fifteenth Edition.

The publication of the American Medical Directory involves a tremendous amount of effort on the part of the Biographic Department. It is essential that the files of the Biographic Department shall be maintained to the highest possible degree of accuracy and that the information contained in these files shall be kept up to date. There can be no let-up in the work incident to the preparation and compilation of material to be published in new issues of the Directory. Preparations for the actual publication of the Seventeenth Edition of the American Medical Directory were begun in July 1941. The general make-up of this new edition will be similar to previous editions except that an effort will be made to list the names of physicians who have been called to active duty with the military forces in a manner to indicate that they are serving as medical officers. It will be necessary to use the home addresses of such physicians, since it will not be possible or desirable to publish their present addresses. The names of commissioned medical officers of the United States Navy, together with biographic data, will appear in alphabetical arrangement under the general address of Washington, D. C., with local addresses "Navy Department." Because of the great difficulties occasioned by the unusual and extremely large number of changes of address of physicians and because of the difficulty of maintaining necessary office personnel, there will be unavoidable delay in the issuance of the new Directory, which probably will appear about the first of July rather than in April or May as in previous years.

Advance subscriptions for the Seventeenth Edition of the American Medical Directory received as of Dec. 31, 1941 numbered 3,840, slightly less than the number of orders received at a corresponding time for the Sixteenth Edition.

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau served thirty-four of the official publications of constituent state medical associations during most of 1941. In September 1941 the Hawaii Territorial Medical Association established the *Hawaii Medical Journal*, which became the thirty-fifth member of the group of medical journals served by this bureau.

Commissions earned by the Bureau during the year ended Dec. 31, 1941 amounted to \$39,309.41. The expense incident to the operation of the Bureau was \$16,381.12. The cash discounts allowed in excess of cash discounts received amounted to \$1,928.29. Commissions remitted to state journals at the end of the year amounted to \$21,000. Such remittances are made in proportion to the total amount of advertising secured for each of the cooperating journals.

Mailing and Order Department

In 1941 the total number of pieces of outgoing mail of first and third classes handled through the mailing department, exclusive of copies of publications sent to subscribers, was 2,582,248. More than 635,000 pieces of first class metered mail went out from the Association's office in 1941, while an undetermined but large number of pieces of first class mail were sent out but not handled through the Mailing Department.

The Order Department in 1941 handled 72,017 orders involving the distribution of 404,042 items. More than 6,500 mail bags were used for the mailing of material which passed through this department.

Division of Drugs, Foods and Physical Therapy

On Jan. 14, 1941 the Division of Drugs, Foods and Physical Therapy lost the able leadership of its Director, Dr. Paul Nicholas Leech. Dr. Franklin C. Bing, Secretary of the Council on Foods and Nutrition, served as acting director until July 1, 1941, when Dr. Theodore G. Klumpp assumed the positions left vacant by Dr. Leech's untimely death.

Steps were taken during the year to bring the rules and policies of the three councils which comprise the Division into closer apposition, particularly those relating to testimonial advertising, and it is expected that a uniform statement of attitude will be adopted.

The Council on Pharmacy and Chemistry and the Council on Physical Therapy completed together a study of ion transfer in connection with the consideration of acetyl-beta-methylcholine, and a report was published in THE JOURNAL on Aug. 2, 1941.

The Cooperative Committee on Vitamins has been a valuable influence in coordinating and crystallizing the views of all three councils with respect to the many questions on vitamin therapy that have arisen.

Dr. Klumpp resigned as Director of the Division of Drugs, Foods and Physical Therapy and Secretary of the Council on Pharmacy and Chemistry in January 1942, and, pending other arrangements, the Board of Trustees has authorized the suspension of the Division.

COUNCIL ON PHARMACY AND CHEMISTRY

The Council on Pharmacy and Chemistry has continued its work of keeping the medical profession informed of new medicinal products and of promoting in all possible ways the development and progress of rational drug therapy. The Council's work has never been of greater importance than it is at the present time. While the Food, Drug and Cosmetic Act has been a beneficent influence in protecting the public and the medical profession from fraud and deception, it is highly important that there exist in the profession of medicine an organization qualified to express and crystallize the views of medical experts concerning the standards, actions, indications and dangers of drugs. This is a function which governmental agencies cannot adequately perform unassisted. Once the profession has made its own determination of the scientific facts

and has established a consensus, governmental agencies are then in position to invoke the machinery of law to implement the facts. The function of the Council on Pharmacy and Chemistry is primarily fact finding and educational, and it is altogether a wholesome thing that it should be exercised by an independent, professional group separate and apart from the function of law enforcement.

RELATIONS WITH GOVERNMENT AUTHORITIES

As an authoritative group in drug matters, the contacts of the Council with the Federal Food and Drug Administration, the Federal Trade Commission, the armed forces, the Office of Production Management and the United States Pharmacopeia and National Formulary groups have assumed ever increasing importance. The relations between the Council and these governmental groups have been maintained on the highest plane of service for the common good. In accord with its time honored policy, the Council has given every assistance within its power to the representatives of the government. It is gratifying to note that there were, during the past year, a greatly increased number of calls on the office of the Council from these sources for facts, information and other assistance. The Council takes pride in the contribution to the war effort which it has thus been able to make. It is also a pleasure to acknowledge that the Council has been able to increase its measure of usefulness to the profession and to the public through the facts and information made available to it by governmental agencies, particularly the Federal Food and Drug Administration.

In other ways the work of the Council has received added recognition during the year covered by this report. The state of New Hampshire by legislative enactment recognized New and Nonofficial Remedies as an authoritative compendium of drugs, along with the United States Pharmacopeia and the National Formulary. It is understood that New and Nonofficial Remedies is employed as a guide by the medical departments and purchasing agencies of the armed forces in determining whether or not drugs under consideration have obtained the recognition and acceptance of the medical profession.

WORK OF THE COUNCIL

In the field of new drugs the Council again has been concerned with the new developments in therapy with the sulfonamide drugs and the further rapid developments in the vitamin field. The only members of the sulfonamide group of which brands have not yet been accepted by the Council are sulfaguanidine and sulfadiazine. Consideration of brands of these drugs is proceeding favorably. Much of the Council's time has been taken up with consideration of brands of sulfapyridine, sulfathiazole and sulfanilamide. Through its scrutiny of promotional material and advertising copy, the Council has been highly successful in restricting the claims advanced for these important drugs to those which have been supported by adequate scientific evidence.

In addition to routine acceptance of brands of various already accepted vitamins the Council has accepted, during the year, pyridoxine hydrochloride and menadione. The former was accepted for investigational purposes only, and tests and standards for both have been elaborated. The Council also accepted a vitamin D₂ preparation marketed under the proprietary name "Drisdol."

Other important new products accepted by the Council during the current year are Acetyl-Beta-Methylcholine with the proprietary brand Mecholy Chloride; Adrenal Cortex Extract; the new anesthetics Cyclopropane and Amylcaine Hydrochloride; Aluminum Hydroxide Gel with the proprietary brand Creamalin, and the various Phenylmercuric Compounds—Merphenyl Nitrate (Basic), Merphenyl Picrate Tincture and Merphenyl Borate Tincture.

The Council has kept pace with the latest developments in serum therapy by accepting Normal Human Serum and Normal Human Plasma with various marketed brands, as well as Antipneumococcal Rabbit Serum Types 3 and 14. The Council is sponsoring investigations in connection with the consideration of other higher type Antipneumococcal Serums.

NOMENCLATURE

Because of new developments the Council has of recent years been much concerned with matters of nomenclature. During

the past year the Council adopted the nonproprietary term "Menadione" for the substance 2-methyl-1, 4-naphthoquinone, a synthetic vitamin K preparation. This term was subsequently adopted by the Revision Committee of the United States Pharmacopeia. The Council adopted the nonproprietary term "Diethylstilbestrol" for the diethyl derivative 4:4'-dihydroxy alpha:beta-diethylstilbene. This term has also been adopted by the Pharmacopeia Revision Committee. A system of nomenclature for noncrystalline estrogenic preparations was considered, and the term adopted is Solution of Estrogens or Solution of Estrogenic Substances. Forms other than solutions will use an appropriate term, such as Suppositories of Estrogens or Estrogenic Substances, and Tablets of Estrogens. These terms, of course, are all nonproprietary. The designation "Phenytol Sodium" was adopted as the nonproprietary name for sodium diphenyl hydantoinate. In the sulfonamide field the Council adopted the terms Sulfadiazine and Sulfaguanidine as nonproprietary designations for 2-sulfanilamidopyrimidine and sulfanilylguanidine respectively. At the instigation of the Council the United States Pharmacopeia Revision Committee adopted the terms "Isotonic Solution of Sodium Chloride" and "Isotonic Solution of Three Chlorides" to replace "Physiological Solution of Sodium Chloride" and "Physiological Solution of Triple Chlorides" respectively.

It should be emphasized that the work of the Council in drug nomenclature is exceedingly valuable in the prevention of confusion of terminology. In this field the Council works in close cooperation with the Nomenclature Committee of the American Chemical Society and other organizations having an influence on drug nomenclature. It gives all due consideration to the wishes of the discoverers of products which are to be named, urging, however, that any taint of therapeutic suggestion be avoided.

RULE 11 OF THE COUNCIL

Another function of the Council on Pharmacy and Chemistry which has received emphasis in the past few years is the consideration of the status of the firms under the Council's Rule 11, which is designed to prevent acceptance of products marketed by firms whose policies are in conflict with the principles of rational and scientific medicine. Since decisions in this matter must naturally be based on a judgment of the influence on rational therapeutics of a firm's policies and practices, every effort is made to provide objective criteria as a guide. At its meeting in October 1941 the Council considered an outline of objective standards, and it is anticipated that the use of this outline will greatly facilitate and expedite the considerations. If a firm is found satisfactory with regard to Rule 11, the Council proceeds to acceptance or rejection of submitted products, descriptions of which appear in THE JOURNAL.

PUBLICATIONS OF THE COUNCIL

New and Nonofficial Remedies.—Of outstanding importance was the adoption by the Council during 1941 of a proposal for the revision of the format of New and Nonofficial Remedies. This proposal provides for a more logical arrangement of drug groups into revised chapters, and the elimination of redundant printed material. As far as possible these changes will make their first appearance in the 1942 edition of New and Nonofficial Remedies. More than five thousand five hundred copies of New and Nonofficial Remedies were distributed during the year to physicians, manufacturers of pharmaceutical products, pharmacologists, governmental institutions and teachers. A similar amount in paper bound copies was supplied to the classes in pharmacology of recognized medical schools.

Epitome of the U. S. Pharmacopeia and National Formulary.—More than three thousand copies of the latest edition of the Epitome were distributed during 1941. It is popular with both pharmacists and physicians. A new edition will be prepared as soon as the next revisions of the Pharmacopeia and the National Formulary are released.

Useful Drugs.—Over four thousand, seven hundred and fifty copies of Useful Drugs were distributed during 1941 among practitioners and medical students, who are the principal users of this publication. The next revised edition is due in 1942.

American Medical Association Interns' Manual.—During the past year one thousand, one hundred and twenty copies of the

American Medical Association Interns' Manual were disposed of and at present a new edition is being prepared. The distribution of this volume has fallen off to some extent; it is believed that this is due largely to the fact that the text is in need of extensive revision to bring it up to date. The demand for the Manual since its introduction indicates that interns find this to be a very useful handbook.

Glandular Physiology and Therapy.—The new series of articles on the endocrines which has appeared serially in *THE JOURNAL* over the past year has now been collected in book form. This volume will detail the recent advances made in endocrinology almost up to the time of printing, as the articles themselves were revised before binding. This new edition should be of unusual value to practitioners, since it correlates the basic physiologic principles and the application of these to the practice of medicine.

REPORTS OF THE COUNCIL

The Council's reports of all kinds, with few exceptions, are first published in *THE JOURNAL* and later collected into a volume, *The Annual Reprint of the Reports of the Council on Pharmacy and Chemistry*. Reports fall roughly into the following groups: reports of omission or rejection, preliminary reports on products not yet ready for acceptance, and status reports on drugs or on various therapeutic or pharmacologic problems.

The Council during the year reconsidered the report on Bacteriophage Therapy by Drs. Krueger and Scribner, which supplements the previous reports of Drs. Eaton and Bayne-Jones, and, as a result of the restudy of the problem, the authors and the Council concluded that the accumulated clinical data are in some instances highly suggestive and warrant the continuation of further studies under thoroughly controlled conditions. Another question reconsidered was the dangers of Cinchophen and Neocinchophen. This restudy confirmed the Council's previously expressed opinion that these drugs should not be employed unless the attending physician feels that the patient's need fully justifies the demonstrated risk in using them.

During the year the Council gave consideration to various human convalescent serums and has accepted Human Convalescent Measles Serum and Human Convalescent Scarlet Fever Serum but feels that the evidence does not yet warrant the acceptance of Human Convalescent Poliomyelitis Serum and Human Convalescent Mumps Serum. A preliminary report on the status of these serums has been issued.

The Council gave extended consideration to the dangers of preparations containing petrolatum and vegetable oils as vehicles intended for introduction into the nasal cavity, a subject on which a report has already been published in *THE JOURNAL*, and a further report submitted for publication. In harmony with the attitude reflected in the report, the Council voted to eliminate from New and Nonofficial Remedies all nose drops and nasal sprays containing petrolatum. The evidence concerning the danger of nasal preparations containing vegetable oils was not considered sufficiently persuasive at the present time to warrant similar action. The Council similarly gave consideration to the use of halogenated vegetable oils for bronchography and issued a report.

In connection with the published acceptance of Human Blood Plasma and Serum, the Council issued a comprehensive report on the present status of these therapeutic agents, the value of which is being especially demonstrated under war conditions.

The Council sponsored a report prepared by Dr. M. L. Tainter on the Sympathomimetic Amines as Epinephrine Substitutes. This report is a valuable comparative study of these widely used drugs. It calls attention to several unsolved problems of their use and especially to the danger of addiction from amphetamine sulfate.

In the field of endocrinology the Council issued a preliminary report on Progesterone and the Status of Corpus Luteum Hormones Therapy. The Council decided that the time had not yet come to accept any preparation of progesterone and in another report definitely rejected a so-called "oral progesterone," pregnenolone.

MEMBERS OF THE COUNCIL

During the year Dr. James P. Leake was elected to membership on the Council, succeeding the late Dr. C. W. Edmunds. Drs. Rose, Sollmann and Sevringhaus, whose terms of membership expired during the year, were elected to succeed themselves.

Following the resignation of Dr. Theodore G. Klumpp as Secretary of the Council on Pharmacy and Chemistry in January 1942, Dr. Austin E. Smith, for some years a member of the Council's staff, was made Acting Secretary of the Council.

Aside from the exigencies created by the fact that our country is at war, the Council on Pharmacy and Chemistry faces a more than usually arduous year. Too much credit cannot be given to the efforts of the members of the Council whose only remuneration for the sometimes onerous burden of work is the realization of service to the cause of rational medicine, which is epitomized in the Council's motto "Non Sibi Sed Medicinæ." In this connection credit should be given to numerous consultants who have generously given their service to the Council in the consideration of questions relevant to their special fields of knowledge. A list of these consultants is published in each annual issue of New and Nonofficial Remedies.

Summary

The Council on Pharmacy and Chemistry has continued fruitful and satisfactory relations with various governmental agencies.

In the field of new drugs the Council has again been concerned with the new developments in therapy with the sulfonamide drugs and the further rapid developments in the vitamin field. More than usual attention has been given to matters of nomenclature, mainly because of the rapid development of new drugs. The main effort of the Council in this regard is to avoid the confusion caused by multiple names for the same drug and the evils of therapeutically suggestive names.

Publications of the Council have continued to enjoy satisfactory distribution. A new edition of the book "Glandular Physiology and Therapy" is in the process of preparation, and a radical revision of the format of New and Nonofficial Remedies is being made for the 1942 edition.

The Council has issued many important reports during the year, among the most important of which are those on bacteriophage therapy, the dangers of Cinchophen and Neocinchophen, various human convalescent serums, preparations containing petrolatum and vegetable oils for nasal inhalations and halogenated vegetable oils for bronchography, human blood plasma and serum, the sympathomimetic amines as epinephrine substitutes and the status of corpus luteum hormones therapy.

During the year the Council lost its Secretary, the late Dr. Paul Nicholas Leech, and a member of long standing, the late Dr. C. W. Edmunds.

COUNCIL ON PHYSICAL THERAPY

The Council on Physical Therapy has continued its duties of investigating and reporting on new apparatus offered to the profession for diagnostic and therapeutic purposes, publishing informative articles on reliable and effective physical therapeutic measures and advising research workers in the field. Emphasis has recently been placed on the publication of material considered valuable to those members of the profession engaged in the nation's war effort.

PUBLICATIONS OF THE COUNCIL

The Handbook on Amputations, recently published, contains practical information on the general principles governing all kinds of amputation, sites of election, physical therapy in amputations and mechanics of artificial limbs. The volume has already found favor with the profession. Over a period of three years the Consultants on Artificial Limbs have devoted considerable time and effort to reviewing the literature, gathering facts and opinions and assembling the material in short, concise articles which were first published in *THE JOURNAL*. Since this group of consultants was composed of leading orthopedic surgeons and of representatives of the Association of Limb Manufacturers of America, the Handbook is a reliable guide for physicians desiring the latest information on technique of amputation and on the most satisfactory prosthesis. The Council is indebted to the consultants for their untiring efforts.

A Manual on Physical Therapy, the contents of which have been published in WAR MEDICINE and have been collected in a small handbook, is ready for distribution. It is a short, concise summary of the pertinent facts pertaining to the therapeutic value of physical agents. The Council believes that it will be useful to medical officers in the Army and Navy and to physicians engaged in civilian defense work as well as to the general practitioner. The Subcommittee on Physical Therapy of the National Research Council cooperated in the preparation of this volume.

Apparatus Accepted, a Council publication containing a list of accepted products, has been revised, and copies are available on request to the secretary of the Council.

Articles and reports published under the auspices of the Council included "X-Ray Protection" by Lauriston S. Taylor, Ph.D., "Radiotherapy for Inflammatory Conditions" by A. U. Desjardins, M.D., "Corsets and Backache" by Frank R. Ober, M.D., "The Management of the Cerebral Palsies" by Winthrop M. Phelps, M.D., "Explosion Hazard in Anesthesia," "Interrelationships of the Artificial Limb Manufacturer, the Surgeon and the Patient," "Physical Therapy in Amputations," "Amputation in Congenital and Chronic Disabilities," "Reamputations and Secondary Amputations," "Ion Transfer," "Amputations in Diabetes Mellitus and Peripheral Vascular Disease," "Rehabilitation" and "The Manufacture of Artificial Limbs."

RESEARCH

Grants were awarded through the Council's Committee on Research in aid of research on the following subjects:

- A functional examination of respiration in obstructive diseases.
- A continuous record of the total daily amount of ultraviolet radiation of wavelengths 3,200 angstroms and shorter from the sun and the entire sky incident on a horizontal surface, in clear and cloudy weather, as function of the season and the geographic latitude.
- A survey of methods used in artificial respiration.
- Studies of the physiologic effects of short wave diathermy.
- An experimental study of the amplification afforded by hearing aids under conditions of actual usage.
- Further research on anesthesia by means of refrigeration in surgery of the extremities.
- Further development of method and portable apparatus for clinical determination of blood flow in the arm or leg.

Previous grants have yielded very gratifying results in basic scientific research.

ARTIFICIAL RESPIRATION

Research in the field of artificial respiration, both manual and mechanical, is being continued. The survey of methods used in resuscitating the asphyxiated individual has been prosecuted for two years, and the Council expects to continue it for at least five years.

The investigation and acceptance by the Council on Physical Therapy of apparatus for administering artificial respiration does not constitute a recommendation to abandon manual artificial respiration. In emergency cases, especially those occurring outside medical institutions, apparatus whether inhalator or resuscitator is seldom if ever at the site of the accident. A period of ten minutes to half an hour or perhaps longer elapses before an apparatus arrives. It is of paramount importance that artificial respiration be instituted immediately, and the public should be given instruction on how to administer approved methods of manual artificial respiration such as are described in the American Red Cross First Aid Textbook.

The Consultants on Respirators have aided the Council in its investigation of equipment used to provide artificial respiration over long periods of time such as for patients having poliomyelitis. When an epidemic of poliomyelitis strikes a community, the medical and hospital facilities especially with regard to respirators may be inadequate, and in an effort to relieve this situation to some degree the Council reviewed and adopted specifications for the construction of a homemade respirator. Reprints of "A Simple Workable Respirator" are now available. The homemade device is suggested for emergency purposes only. The more rugged commercially available equipment is recommended for prolonged treatment.

ULTRAVIOLET RADIATION

For several years the Council on Physical Therapy has given consideration to ultraviolet generators designed for germicidal purposes. Studies have been made of the effect of these lamps

in schoolrooms, hospital operating rooms and nursery cubicles. Available critical evidence indicates that the ultraviolet radiation from these lamps will destroy bacteria, provided the air borne germs come within direct range of the lethal ultraviolet rays. Bacteria lurking in the shadows or under opaque objects will not be affected; in fact, thin films of grease, oil and other organic and inorganic matter, even though transparent, will protect the bacteria from destruction. Cross infection may be eliminated only under certain conditions. For example, babies surrounded by mechanical barriers and "curtains" of ultraviolet radiation may be protected from cross infection, provided care is exercised to avoid contamination by some other means such as careless nursing practice. The Council's report "Requirements for Ultraviolet Lamps for Disinfecting Purposes" contains further information on this subject.

RADIO INTERFERENCE

The Council has continued its cooperation with the Federal Communications Commission in an effort to solve the problem of radio interference caused by diathermy apparatus. Three frequency channels, 13,665, 27,330 and 40,995 kilocycles per second, have been tentatively assigned, although the tolerances of these frequency channels have not been fixed.

AUDIOMETERS AND HEARING AIDS

Work on an acceptable procedure for estimating percentage loss of hearing has progressed, and the Council in cooperation with its Consultants on Audiometers and Hearing Aids expects to make a definite report in the near future. Careful investigations have been made of the various hearing aids and audiometers on the market, and reports have been published.

EDUCATION

The Consultants on Education, under the supervision of the Council, have contributed an important service in the dissemination of reliable information on the true values of physical therapy in the practice of medicine. It is gratifying to note that several schools of medicine which formerly had no undergraduate courses in physical therapy now include courses in their curriculums as a result of the efforts of the Council on Physical Therapy.

EXHIBITS

The Exhibit on Lame Backs was repeated at the Cleveland session in 1941 and was very successful. It will be presented again in 1942 with additional material. The Council provided exhibits during the year at the meetings of the American Academy of Ophthalmology and Otolaryngology and the American Congress of Physical Therapy.

INVESTIGATIONS AND REPORTS

The Council has continued its investigation of physical therapy apparatus and has published reports of forty-five acceptances and of nine rejections. Most members of the medical profession probably are not fully aware of the tremendous amount of material consisting of reports, articles, advertising and correspondence which the members of the Council are obliged to review during the year. The members of the Council on Physical Therapy receive no remuneration for their services but give freely of their time and energy.

Cordial cooperation has been maintained with the National Bureau of Standards, the American Standards Association, the Food and Drug Administration and the Federal Trade Commission.

Summary

The Council on Physical Therapy has continued its work of investigating apparatus offered for diagnostic and therapeutic purposes and reporting its decisions in *The Journal*.

During the year the Handbook on Amputations, the Manual on Physical Therapy and numerous articles on physical therapy were edited and published, and Apparatus Accepted was revised.

Several grants in aid of research have been made. Research in the field of artificial respiration is being continued and expanded. Specifications for ultraviolet lamps designed for disinfecting purposes have been compiled and adopted.

Cooperation has been maintained with the Federal Communications Commission in an effort to solve the problem of radio interference caused by diathermy apparatus.

Work has progressed on an acceptable procedure for estimating percentage loss of hearing. Hearing aids and audiometers have been investigated and reports published.

Through the efforts of the Council's Consultants on Education, courses in physical therapy have been included in the curriculums of several schools of medicine that were without undergraduate physical therapy instruction.

Exhibits on physical therapy were presented at two medical meetings.

Forty-five acceptance reports and nine reports of rejection have been published, while many more pieces of apparatus have been investigated.

Correspondence relating to physical therapy apparatus has become a major part of the Council's work.

COUNCIL ON FOODS AND NUTRITION

The Council on Foods and Nutrition has continued in every possible way its policy of cooperation with governmental agencies in matters that come within the scope of the Council, and the facilities of the Council will no doubt be utilized to an ever increasing extent as the war continues.

Members of the Council have served on a number of important advisory committees to government agencies, especially the Food and Nutrition Board of the National Research Council. The recommended daily allowances formulated and adopted by the Food and Nutrition Board were approved by the Council on Foods and Nutrition for purposes of judging nutritional claims in advertising. The National Nutrition Conference for Defense held in Washington in May 1941 received the active cooperation of the Council.

FORTIFICATION OF FOODS

The principal problems confronting the Council during the year covered by this report again have centered about the question of the fortification of foods with vitamins and minerals, and the Council has approved the enrichment of flour and of bread along the lines suggested by the National Research Council and developed by the Food and Drug Administration at public hearings. The Council has aided in the production of advertising material that promotes the use of enriched flour and bread in a truthful manner.

At the present time the Council believes that it is inexpedient and undesirable to add thiamine or other members of the vitamin B complex to sugar, syrups, candy, carbonated beverages and other products containing appreciable quantities of sugar. On the other hand, the Council favors the addition of vitamin A to oleomargarine and commends the Bureau of Animal Industry for removing its long time opposition to the presence of vitamins in establishments which prepare oleomargarine from fats of animal origin under federal inspection. In view of the action of the Food and Drug Administration to standardize vitamin A fortified oleomargarine at a level of 9,000 U. S. P. units of vitamin A to the pound, the Council raised its own standard of 7,500 U. S. P. units to this level as well. This amount is considered to be about the average vitamin A value for butter, but summer butter may contain more than 20,000 U. S. P. units of vitamin A to the pound.

The Council on Foods and Nutrition does not accept any general purpose foods other than milk when they are fortified with vitamin D. Evidence regarding the value of vitamin D fortified cereals is accumulating, however, and the Council is continuing to study this evidence. At the present time it appears that vitamin D is of value only in association with calcium and phosphorus. All evidence shows that the securing of a proper amount of calcium in the diet is fully as important as the vitamin D intake, and the Council has not given favorable consideration to the fortification of milk with more than the present accepted maximum quantity of vitamin D, which is 400 U. S. P. units to the quart. Milk fortified with 600 U. S. P. units of

vitamin D to the quart has been marketed, but the Council voted not to accept this product.

The question of mixed vitamin therapy was considered, and it was recommended to the Council on Pharmacy and Chemistry that favorable consideration be given to those polyvitamin preparations which are otherwise acceptable and which provide in the daily dose the various vitamins in quantities that are related in some uniform simple manner to the daily requirements of each. A general report on the subject has been prepared in cooperation with the Council on Pharmacy and Chemistry.

In cooperation with the Council on Industrial Health, consideration has been given to the question of indiscriminate vitamin administration to industrial workers. The Council on Foods and Nutrition disapproves this practice, although the value of vitamin therapy under the direction of a physician is recognized.

PROBLEMS AND PRODUCTS CONSIDERED

One of the most difficult problems before the Council has been the formation of a decision regarding tolerances for lead and arsenic in foods. Governmental authorities recently have raised the tolerance for lead and arsenic, but the Council on Foods and Nutrition voted to retain its old standards.

The Council gave further consideration to claims in advertising for the value of gelatin in combating fatigue and concluded that the evidence made available is insufficient to warrant any change in allowable claims for gelatin.

The tendency of firms to develop and promote the use of prepared dessert products especially for children was given careful study. The Council is of the opinion that desserts have no justified place in the dietary of the infant and will accept only those commercial products which contain a minimum of 50 per cent by weight of fruit or milk or a combination of fruit and milk.

The Council on Foods and Nutrition gradually is limiting its scope so that it may devote more attention to those products which are most important from the health point of view. This policy is being carried out gradually so that firms that have cooperated with the Council in its efforts to promote the preparation of good foods truthfully advertised would not be placed at a serious disadvantage.

Among the new products of interest that have been favorably considered by the Council have been various ingredients for use by bakers for the making of enriched bread, a new type of syrup made from corn starch by controlled hydrolysis, and an infant feeding preparation for infants that cannot tolerate cow's milk the feature of which is the adoption of a mixture of amino acids for the protein.

PUBLICATIONS

The book "Accepted Foods and Their Nutritional Significance" now is undergoing extensive revision. The supply of the book on the vitamins, which was developed in collaboration with the Council on Pharmacy and Chemistry, has been exhausted, and plans have been considered for the publication of a revised series of articles on this subject. The Council is planning to sponsor during 1942 a new series of articles on foods and nutrition.

CHANGES IN MEMBERSHIP

During the year the Council lost through death the services of Dr. Mary Swartz Rose. A distinguished nutritionist, Dr. Rose had served the Council faithfully for a number of years and had contributed greatly to the effectiveness of its work. Dr. C. A. Elvehjem of Madison, Wis., was elected to succeed Dr. Rose as a member of the Council.

This report of the Council on Foods and Nutrition does not by any means reflect fully the activities of the Council during the past year, for the reason that it would require a report of excessive length to present in detail all matters that have received official consideration and to mention all the problems and products that have been brought before the Council. The report discusses only some matters of the most important, immediate interest in the field of nutrition.

Summary

The Council on Foods and Nutrition during the year covered by this report continued in every possible way to cooperate with governmental agencies in matters coming within the scope of the Council.

The principal problems confronting the Council again centered about the question of the fortification of foods with vitamins and minerals, and the Council approved the enrichment of flour and bread along lines suggested by the National Research Council and developed by the Food and Drug Administration.

The Council at present believes it is undesirable and inexpedient to add thiamine or other members of the vitamin B complex to products containing appreciable quantities of sugar but favors the addition of vitamin A to oleomargarine and has raised its standard for this product to the level recently set by the Food and Drug Administration.

The Council does not accept any general purpose foods other than milk when they are fortified with vitamin D but is continuing to study the evidence regarding the value of vitamin D fortified cereals.

The question of mixed vitamin therapy was considered, and it was recommended to the Council on Pharmacy and Chemistry that favorable consideration be given to certain polyvitamin preparations.

The Council on Foods and Nutrition, in cooperation with the Council on Industrial Health, considered the question of indiscriminate vitamin administration to industrial workers and disapproved this practice.

Among difficult problems before the Council during the year were the formation of a decision regarding tolerances for lead and arsenic in foods, the consideration of claims in advertising for the value of gelatin in combating fatigue and the tendency of firms to produce and promote the use of prepared dessert products especially for children. The Council voted to retain its old standards with respect to tolerances for lead and arsenic, concluded that the evidence available is insufficient to warrant any change in allowable claims for gelatin and, since it is of the opinion that desserts have no justified place in the dietary of the infant, will accept only those commercial products which contain a minimum of 50 per cent by weight of fruit or milk or of a combination of fruit and milk.

The Council is gradually limiting its scope to devote more attention to those products which are most important from a health point of view.

Accepted Foods and Their Nutritional Significance, an official publication of the Council, is being revised and plans are being considered for the publication of a revised series of articles on the vitamins and a new series on foods and nutrition.

During the year the Council lost, through death, the services of Dr. Mary Swartz Rose, a distinguished nutritionist. Dr. C. A. Elvehjem was elected to succeed Dr. Rose as a member of the Council.

THE CHEMICAL LABORATORY

The Chemical Laboratory marked its thirty-fifth anniversary in October 1941. The Laboratory has functioned continuously during this period to supply accurate and critical chemical information to the medical profession, primarily in connection with the consideration of products submitted to the Council on Pharmacy and Chemistry. Because of continued rapid advances in the therapeutic armamentarium, the work of the Laboratory has consistently increased in amount and scope, and the record of years of careful, constructive and varied service is one of which the Association can be justly proud.

Dr. A. E. Sidwell Jr., a member of the Laboratory staff for several years, was made Director of the Chemical Laboratory following the untimely death of Dr. Paul Nicholas Leech, former Director.

TESTS AND STANDARDS

Each year brings forward many new synthetic therapeutic agents for which tests and standards must be elaborated and evaluated in connection with their consideration by the Council on Pharmacy and Chemistry and, in addition, numerous accepted products must be reexamined and new dosage forms of these

and of official drugs must be analyzed. During the past year the Laboratory has been particularly active in the preparation or critical consideration of standards for aluminum hydroxide gel, amylcaine hydrochloride, blended oils containing vitamins A and D, solutions and tableted preparations of calcium gluconate, delvalin sodium, dextrose in lactate-Ringer's solution, epinephrine in oil, mecholyl bromide and mecholyl chloride, merphenyl borate, merphenyl nitrate, merphenyl picrate, nikethamide, pyridoxine hydrochloride, seconal sodium, sulfadiazine and sulfadiazine sodium, sulfaguanidine monohydrate, sulfathiazole sodium and its hydrates, a number of antihemorrhagically active substances (vitamin K) including menadione and zinc insulin crystals and zinc peroxide medicinal. The complete roster of the products examined in the Laboratory during the year, exclusive of the various dosage forms of similar products considered, contains some seventy-two different therapeutically active substances.

Members of the departments of pharmacology of the University of Chicago and the University of Minnesota have cooperated with the Laboratory in problems concerning the standardization of epinephrine and sulfathiazole.

During the year the Laboratory has continued to give all possible assistance to other bureaus and departments of the Association and has cooperated with the laboratories of the American Dental Association, the Food and Drug Administration and many manufacturers in the exchange of chemical information concerning standards for the identity, purity and strength of various drugs.

From time to time, fellows of the International Health Division of the Rockefeller Foundation have been assigned to the Chemical Laboratory of the American Medical Association so that they might have opportunity to have the benefit of a period of basic training in drug analysis. Within the past year Mr. Jose Crusellas Ventura of Guayaquil, Ecuador, spent several weeks in the Laboratory. The members of the Laboratory staff greatly enjoyed and appreciated their association with Mr. Crusellas.

Members of the Laboratory staff have attended and addressed a number of meetings of chemical groups and have contributed original articles to important chemical publications. Work is in progress and plans have been formulated to augment the scope and efficiency attainable with the generally excellent laboratory equipment, particularly in connection with the facilities for microchemical and spectroscopic work.

Council on Industrial Health

INDUSTRIAL HEALTH AND WAR INDUSTRY

A recent joint session of the Council on Industrial Health with the Subcommittee on Industrial Health and Medicine of the Federal Security Agency indicates that the Council has established satisfactory contact and has perfected its own organization to an extent that will make it of genuine service in the prosecution of the war. Specific developments in this direction have been the following:

It was agreed that the medical profession is in better position to assume a greater degree of responsibility for industrial health activity than ever before. Medical societies in states and counties have been supplied with recommendations calculated to accelerate this process and have also been repeatedly instructed that the physician in community practice must be prepared to provide industrial health services in medium sized and small plants and that a high degree of organization will be necessary to meet the medical requirements of war time industrial production.

It was recognized that, if industry is to absorb the products of accelerated industrial health training, some concomitant program of instructing industrialists in the advantages of medical supervision over workers is highly essential. It is the feeling that an agency for public information, preferably attached to the Subcommittee on Industrial Health and Medicine, should undertake this educational activity. Failure to push this type of voluntary program vigorously might logically lead to compulsory forms of industrial medical supervision according to the present European pattern.

The Council has recognized that adequate personnel is basic to a solution of medical service in industry, and it intends to

cooperate in as effective a manner as possible with the Procurement and Assignment Service. Since this war is being fought on the assembly lines as well as in the field, it would be a serious error to strip industry of its competent and qualified medical personnel even though many of them happen to be within the age limits and degrees of physical fitness considered desirable for the armed forces.

Not much progress has been made in promoting cooperation between bureaus of industrial hygiene in state and local governments and the committees on industrial health in state and local medical societies. Much greater effort will be made in this direction in the coming months. Recent reports from the Division of Industrial Hygiene of the U. S. Public Health Service indicate that thirty-six states, four cities, two counties and two territories conduct industrial hygiene bureaus requiring an annual expenditure of \$1,000,000. Activities of this kind are of unusual significance now, and a program of reciprocal helpfulness between the bureaus and the profession at large can represent a real contribution to industrial production.

During recent months the registration of volunteers for placement in war industry has occupied a considerable share of activity at the headquarters office of the Council. The organization of the Procurement and Assignment Service suggests that henceforth the Council may serve as a source of information to employers who are anxious to secure assistance in obtaining and retaining the services of industrial physicians. Notification of this change in method will be brought to the attention of manufacturers, commerce and trade associations directly and through business and trade publications.

DICTIONARY OF INDUSTRIAL HEALTH

The scope of the Dictionary of Industrial Health, a project which began as a contribution toward standardization in the field of industrial health nomenclature, has been successively expanded until the title "Dictionary" seems most applicable. Publication of this compilation will tend to stabilize accepted procedure in industrial health at a time when much interest in terminology and technic exists. It is expected that editorial revision by consultants and in the Council office will have been completed by early fall.

EDUCATIONAL ACTIVITY

The Council on Industrial Health has been requested by the Council on Medical Education and Hospitals to assume the initiative in calling the attention of educators and the profession at large to deficiencies in industrial medical education. A report has been prepared, representing a joint declaration by the Council and a special committee of the American Association of Industrial Physicians and Surgeons, containing definite recommendations about the importance of better teaching and its organization and content. This outline can be used, with suitable modifications, for the organization of continuation studies of the introductory or refresher type under medical society sponsorship or in medical schools. The material also can be adapted to extended periods of training designed to equip physicians as specialists in industrial practice.

The Council has recognized health education as a proper function of industrial practice, and special attention has been given to the employment of HYGEIA as a means for acquainting employers and workers with the advantages of industrial health, its proper objectives and its methods.

In other respects the general details of the Council's educational activities continue as reported in previous years.

RELATIONSHIPS WITH GROUPS AND ORGANIZATIONS

Committees on Industrial Health in State and County Medical Societies.—Major emphasis must continue to be placed on improving the character of membership in cooperating committees on industrial health in the state medical societies and on extension of this type of organization down into the county societies. Field activity by the Council's headquarters organization will serve to encourage improved regional and local leadership as well as to recommend specific programs of investigation, correlation and education. Industrial Health Bulletins continue to serve as a means of interchange of expression between these committees and the Council. This activity, in

the opinion of the Council, exceeds all others in terms of practical results.

Sections of the Scientific Assembly.—The steps taken to arouse interest in industrial health in the sections of the Scientific Assembly through the creation of advisory committees have been remarkably productive. These sections are great reservoirs of authoritative information and have already served as sources of sound advice and help in the solution of special problems.

Other Agencies in the American Medical Association.—The Council has completed its first series of recommendations of objectives and functions in industrial health, entitled "An Outline of Procedure for Physicians in Industry," also reviewed and approved, after modification, by the Judicial Council. It is expected that this outline will demonstrate to the profession at large that industrial practice can be conducted ethically, scientifically and efficiently in full recognition of the best interests of the worker, employer, official agencies and the community at large.

A joint report has been prepared by representatives of the Council on Foods and Nutrition and the Council on Industrial Health on indiscriminate administration of vitamins to industrial workers, which effectively answers the many inquiries received about promotional activity among employers by manufacturers of vitamin products.

It has been recommended that the Council on Industrial Health develop an industrial medical formulary in collaboration with the Council on Pharmacy and Chemistry and with such additional help as may be necessary from the advisory committees of the sections of the Scientific Assembly. This formulary would define general standards to be applied to preparations and equipment, protective rather than therapeutic in nature, designed for use in the medical management or control of industrial exposures. A development of this kind would tend to avoid the necessity for setting up machinery to pass judgment on or approve individual preparations or equipment.

The Council has reviewed, with representatives of the Council on Physical Therapy, certain problems relating to the nomenclature of respirators.

Members of the Council have been requested to prepare radio scripts on industrial health subjects of general interest as a part of the broadcasting program of the Bureau of Health Education.

Industrial Nursing.—The Council on Industrial Health has maintained its interest in industrial nursing, especially in view of a strong movement by nursing and public health organizations toward providing a program of service to small industry, which depends mainly on part time employment of personnel from visiting nurse associations. Since the physician must be the central figure in any completely dependable industrial health activity, these developments must be regarded with unusual interest by medical organizations. However, the Council expects to promote the professional status of the industrial nurse in every way possible and has recently responded favorably to an invitation to appoint a representative to act as consultant to a Committee of the American Public Health Association to Study the Duties of Nurses in Industry. Meanwhile the Council will engage, as necessity dictates, in independent investigation of industrial nursing activity, particularly in the preparation of standing orders for industrial nurses, part time nursing in industry at hourly rates, and a simple report form applicable for recording absences in small industry.

Manufacturing Organizations.—The Council has been interested in the industrial health programs in various stages of development of the National Association of Manufacturers and the U. S. Chamber of Commerce. Both organizations have investigated the merits of appraisal plans, and there is some prospect that a national campaign may shortly ensue to arouse interest in industrial health and to establish a means of appraising the efforts of established industrial medical services.

Organized Labor.—If the Council is to be regarded as an influential, impartial and unbiased agency representing medical opinion in the field of industrial health, it must give some consideration to the opinions of the beneficiaries of this form of medical activity. Study will be necessary to indicate the best means for acquiring information of this character and of giving it due consideration in the formulation of medical policy in this field.

INDUSTRIAL PHYSICAL EXAMINATIONS

Repeated requests for information outlining definite procedure in the conduct of preemployment and periodic physical examination have made it imperative that the Council prepare an outline covering this subject to be made available to physicians called on to organize services of this description in industry. In the preparation of this outline the principles already formulated by the American Medical Association on periodic health examinations will be adapted to industrial use.

OCCUPATIONAL DISEASE REPORTING

Available evidence indicates that occupational disease reporting is improving. Since progress cannot occur without reasonably dependable statistics on the nature and incidence of occupational disability, persistent effort will be made to arouse and sustain interest throughout the profession in this desirable practice.

WORKMEN'S COMPENSATION

In the early discussions which led to the formation of the Council on Industrial Health, much emphasis was placed on the necessity for improvement in workmen's compensation procedure. Medical relations in this field dealt largely with economic considerations—the provision of medical care, methods of payment, critical analysis of contracts for medical care and hospitalization, medical testimony and disability evaluation. Important as these activities have been, the Council now believes it desirable to supplement them through consideration of the structure and administrative practices of the industrial commissions themselves. Much improvement can occur in the direction of better adjustment between compensation authorities, the medical profession and rehabilitation agencies. The Council is led to this conclusion since it is apparent that legislation with respect to occupational diseases is being adopted without any reference to medical considerations in much the same fashion as occurred when compensation for industrial accidents was being adopted. This failure to consult medicine in fields where sound medical advice is urgently needed has already led to a great many loose and faulty administrative practices.

The Council, therefore, has appointed a Committee on Workmen's Compensation, whose first report contains the following specific recommendations:

That the Council on Industrial Health prepare a series of authoritative articles on prevailing medical opinion about various forms of actual or alleged industrially connected disability, these to be published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*. Ability of physicians, lawyers, courts and administrators to refer to established medical opinion of this character should do much to eliminate unwarranted claims. Such a series of articles should also emphasize medicine's essential position in the administration of workmen's compensation and would improve the status of the physician in this respect.

That effort should be made to assure recognition of medicine's interest in all proposed compensation legislation, especially in respect to proper representation on administrative boards.

That there be presented, preferably annually in *THE JOURNAL*, data dealing with workmen's compensation practice with special reference to medical considerations, these reports to reflect progress or lack of it in the various states and in the country as a whole.

That the committee extend its membership to include physicians and experts who have broad experience in compensation procedure and who can assist in the promotion of a campaign to improve through statutory revision the present undesirable elements in medical relations under workmen's compensation.

The Council has been notified of efforts to define conditions under which tuberculosis may be considered industrial in origin. Great interest is manifested in this development, since a proposal to compensate for tuberculosis would open the doors to health insurance through the inclusion of many other comparable types of chronic disease. Furthermore, employers would tend to exclude all persons who have or have had tuberculosis from any employment.

INDUSTRIAL HEALTH RESEARCH

The Council has recently appointed a Committee on Research to define problems suitable for investigation, to recommend subsidization of suitable research projects by the American Medical

Association or others and to encourage investigations in harmony with the existing research programs of the American Medical Association and the National Research Council. It is also expected that there will be increasing necessity for the adoption of a program to support work which may be undertaken by cooperating committees of the sections of the Association's Scientific Assembly.

Summary

The Council on Industrial Health has held joint meetings with the Subcommittee on Industrial Health and Medicine of the Federal Security Agency and it has been possible to determine spheres of greatest usefulness under war time industrial production.

Although there has been much progress, great effort must be made to preserve existing qualified personnel and to create educational opportunities for industrial medical volunteers.

Better rapport should exist between committees on industrial health in medical societies and bureaus of industrial hygiene.

As in former years, much emphasis has been placed on educational activity, which has taken the form of annual congresses on industrial health, continuation study and extended training, publications, clearing house services and exhibits. One practical accomplishment has been the development of specific recommendations to medical schools concerning the organization, content and available facilities for improved undergraduate teaching. Results already obtained through field work have led the Council to conclude that this is far and away the most successful activity to date in arousing interest in practical organization for increased industrial health service.

The advisory committees which have been created in the sections of the Scientific Assembly have already demonstrated ability to undertake special assignments for investigation and report. Active cooperation has been maintained with many of the agencies in the headquarters establishment of the Association, and particularly noteworthy results are the "Outline of Procedure for Physicians in Industry" and a recent report on "Vitamin Administration in Industry."

The Council has continued its interest in auxiliary professional groups such as industrial hygienists and nurses. Current plans for promotion of industrial nursing services are of especial significance, and steps have been taken to represent medical opinion in these developments.

Self-appraisal plans as a means of rating the adequacy of industrial medical departments is regarded as of considerable importance, and the Council is prepared to advance these activities in all practical and effective ways. The best methods of reflecting the opinion of organized labor in the field of industrial medical policy are also currently being studied.

In response to repeated requests for a dependable program of industrial physical examinations, an outline of principles which will be in substantial agreement with those already formulated by the American Medical Association in respect to periodic health examinations is being prepared. Persistent effort will also be made to arouse and sustain interest throughout the profession in the desirable practice of reporting occupational diseases to agencies concerned with vital statistics.

The Council is now preparing to make some substantial contributions to certain perplexing problems in the field of medical relations under workmen's compensation, having in mind the growing trend toward indemnification for occupational disease. Present plans include the preparation of authoritative statements on prevailing medical opinion on forms of industrially connected disability which will be available to physicians, lawyers, administrators and others. There should be annual publication of statistical and other data on workmen's compensation practice, with special reference to

medical considerations. The Council is continuing its interest in the relationship between trauma and disease and is currently studying conditions under which tuberculosis may be considered industrial in origin.

The Council on Industrial Health has appointed a Committee on Research to promote investigation in the field of industrial medicine, surgery and hygiene in harmony with the existing research programs of the American Medical Association and the National Research Council. The special investigations undertaken by cooperating committees of the sections of the Scientific Assembly also will merit substantial support.

Bureau of Health Education

The work of the Bureau of Health Education has for the most part been directed along the same lines as in previous years.

During 1941 the Bureau received and answered approximately ten thousand letters from laymen. Correspondence with physicians and cooperating agencies included the receipt of and replies to almost five thousand letters, while miscellaneous mail, including communications stimulated by the Association's radio broadcasting program and exhibits at the Cleveland Health Museum, the Chicago Museum of Science and Industry, the Milwaukee Midsummer Festival and several state and county fairs amounted to approximately fifteen thousand pieces.

BUREAU PUBLICATIONS

Sixteen new pamphlets were added to the list of publications maintained by the Bureau of Health Education, while eight of the pamphlets formerly used were revised and four discontinued. More than two hundred and three thousand copies of the publications sponsored by the Bureau were distributed through the Order Department in 1941 in addition to one hundred and eight thousand others sent out in quantities by the Bureau. Eighty-eight thousand health posters were ordered by a large industrial concern for distribution to its employees as an insert in its house organ.

The Director and Assistant Director of the Bureau have cooperated as fully as possible with the Editorial Department of THE JOURNAL and HYGEIA. Thirty-nine articles originating in the Bureau of Health Education were published in 1941 in publications other than those of the American Medical Association.

RADIO PROGRAM

In cooperation with the National Broadcasting Company, the first series of Doctors at Work programs was completed in June, at which time the sixth season of dramatized network broadcasting terminated.

The success of the program Doctors at Work left no logical course open except to continue with a second series, in which the adventures of the same fictitious young doctor, now in a wartime setting in an industrialized home community, were continued. Unfortunately, the National Broadcasting Company was unable to schedule the second series at an evening hour. The hour accepted was 5 to 5:30 p. m., Saturdays, eastern standard time. Approximately one hundred stations, including three Canadian stations, were in the network to which the program was available.

State and county medical societies and the Woman's Auxiliary to the American Medical Association have continued their valuable cooperation in publicizing the Association's broadcasting program.

At the Cleveland session radio broadcasts were arranged in cooperation with five local and network stations. There were eleven local broadcasts, three broadcasts on the networks of the National Broadcasting Company and two on those of the Columbia Broadcasting System.

The radio library service maintained by the Bureau showed a sharp decline in activity during 1941. Two thousand, two hundred and forty-six copies of radio talks were sent out on request. Sixty-one state and county medical associations received radio material suitable for local broadcasting. The

Bureau also assisted in preparing or editing radio scripts for other organizations.

MEETINGS AND CONFERENCES

In 1941 the Director and the Assistant Director of the Bureau of Health Education appeared before one hundred and forty-eight audiences in various parts of the United States. These appearances involved more than 43,000 miles of travel, and communities in sixteen states were visited. It was not possible to accept all the invitations extended to the Bureau's staff; forty-seven such invitations had to be declined because of schedule conflicts or for other important reasons. Attendance at ten medical meetings addressed by the members of the Bureau's staff was one thousand, three hundred and forty-eight; one hundred and thirteen lay audiences were addressed with an attendance of more than thirty-seven thousand persons, and twenty-five addresses were delivered before audiences composed of teachers, nurses and members of other professional groups with an attendance of more than four thousand.

HYGEIA CLIPPING LOAN SERVICE

The HYGEIA clipping collections were lent to four hundred and eighty-one physicians in forty states and Canada to aid them in preparing speeches for lay audiences. Local HYGEIA loan collection projects are continuing to be initiated by several more medical societies. The continuation of this development tending toward decentralization reveals a wholesome trend and is, in fact, the only way in which this bureau can hope to meet all the health education needs of the medical profession.

COOPERATION WITH LAY ORGANIZATIONS

Joint Committee on Health Problems in Education (with the National Education Association).—The Joint Committee met in Atlantic City in February during the meeting of the American Association of School Administrators. Dr. Isaac Abt, a member of the Committee for thirty-one years, retired and was succeeded by Dr. Glenville Giddings of Atlanta, Ga. Dr. Charles C. Wilson, New York, was elected chairman of the committee for his third successive year, with Dr. Thurman B. Rice, Indianapolis, vice chairman, and Dr. W. W. Bauer, Chicago, secretary.

Deliberations of the committee had to do mainly with the publication known as Suggested School Health Policies and the preparation of a statement on the educational and nutritional aspects of school lunches and a supplement thereto dealing with sanitary requirements for school lunches.

A fifth Symposium on Health Problems in Education under the sponsorship of the Joint Committee together with the Section on Pediatrics, the Section on Preventive and Industrial Medicine and Public Health, the Section on Ophthalmology and the Section on Laryngology, Otology and Rhinology of the American Medical Association was held during the annual session of the Association in Cleveland.

American Association of School Administrators.—The Director of the Bureau of Health Education was appointed by the American Association of School Administrators to its 1942 Yearbook Commission on Health Education. This project, begun in 1940, was completed in 1941, during which year two meetings of the commission were held. The Yearbook appears to have been successfully completed and will be published early in 1942.

4-H Clubs.—The National Committee on Boys and Girls Club Work (4-H Clubs) continued in 1941 as in previous years. The recommendations of the Director of the Bureau of Health Education, who serves on this committee, looking toward the modification and the ultimate abandonment of the "healthiest boy and healthiest girl" contest have not yet been fully adopted, but there are some encouraging evidences that state leaders are beginning to interest themselves in further modifications of this contest.

National Congress of Parents and Teachers.—The National Congress of Parents and Teachers continues its summer round-up of the children, and the Director of the Bureau of Health Education continues as a member of the Advisory Board. Although the 1941 request that the Association furnish the congress half of its summer round-up blanks was approved,

the national congress has notified us that it will not request the blanks owing to the paper shortage

American Public Health Association—The Committee on Professional Education of the American Public Health Association, of which the Director of the Bureau is a member, met in New York late in the year and adopted a comprehensive set of standards and educational qualifications for health education personnel which, if adopted by the governing council of the American Public Health Association, recommended by the Conference of State and Territorial Health Officers, will probably serve as a basis for the merit systems in the several states receiving aid from federal social security funds

National Health Council—The Director of the Bureau of Health Education has been appointed by the Board of Trustees to membership on a Committee for the Study of Voluntary Health Agencies. This has not yet begun to function

Other Organizations—Among other organizations with which the Bureau has maintained cooperative relations are the American Camping Association (advisory board), National Organization for Public Health Nursing (advisory committee, community nursing service), National Conference for Cooperation in School Health Education (executive committee), General Federation of Women's Clubs (advisory committee) and American Museum of Health (scientific advisory board)

COOPERATION WITH STATE AND COUNTY MEDICAL SOCIETIES

The Bureau has continued to serve as a clearing house of information to state and county medical societies and to be of assistance in developing cooperative programs and satisfactory relationships between the medical profession and other organizations working toward similar ends

COOPERATION WITH GOVERNMENTAL AGENCIES

As in previous years, the Bureau has continued its cooperation with departments of the federal government and of state governments, including health departments and departments of education. It has also cooperated as fully as possible with local boards of health, school boards and libraries. The federal departments and divisions with which the Bureau has maintained cooperative relationship include the Federal Security Agency, Veterans' Administration, War Department, Department of Agriculture, Federal Works Agency, Department of the Interior and Department of Labor

The Director of the Bureau continues to serve on the General Advisory Committee of the United States Children's Bureau

PROTECTION OF RESEARCH

The Bureau of Health Education cooperated, as in the past, with the Committee for the Protection of Medical Research and distributed nearly five thousand copies of the pamphlet entitled "Animals in Research" to the members of graduating classes of recognized medical schools

A meeting of the Committee for the Protection of Medical Research with representatives from similar committees of other scientific agencies was held in Chicago on Feb. 18, 1941. Ways and means for carrying out the defense of medical research in a national defense and (then) possible wartime setting were discussed

WOMEN'S HEALTH INTERESTS

The Bureau conducted a survey of women's health interests, and a preliminary summary of the results was published in the Bulletin of the Woman's Auxiliary to the American Medical Association. The Bureau also prepared material on nutrition for use by the auxiliaries as a part of the nutrition conservation program of the Federal Security Agency

Summary

The Bureau of Health Education answered approximately ten thousand letters from laymen, five thousand from physicians and cooperating agencies and fifteen thousand stimulated by exhibits, health museums and radio programs. Sixteen new pamphlets were added to the list of publications, eight revised and four discontinued. More than three hundred and eleven thousand copies of Bureau publications were distributed in 1941. The Bureau contributed thirty-nine articles to publica-

tions other than those of the American Medical Association.

The radio series *Doctors at Work* was continued. Eleven local programs over five stations were broadcast during the Cleveland session, and programs were also broadcast over the networks. Approximately two hundred radio talks were sent out to state and county medical societies from the Bureau's radio library of almost a thousand titles.

The Director and Assistant Director appeared before one hundred and forty-eight audiences, involving more than 43,000 miles of travel in sixteen states and accounting for a total audience of approximately forty-two thousand, three hundred persons. Hygeia loan clipping collections were lent to four hundred and eighty-one physicians in forty states and Canada to aid them in preparing talks for local lay audiences.

The Bureau continued its cooperation with the National Education Association, the National Committee on Boys and Girls Club Work (4-H Clubs), the National Congress of Parents and Teachers, the General Federation of Women's Clubs, the American Public Health Association, the American Camping Association, the Joint Committee on Community Nursing Service and eight departments of the United States government. The Director continued to serve on the General Advisory Committee of the United States Children's Bureau and the 1942 Yearbook Commission of the American Association of School Administrators and was appointed to memberships on the Committee for the Study of Voluntary Health Agencies of the National Health Council and the Scientific Advisory Board of the American Museum of Health.

Miscellaneous projects included continued cooperation with the American Medical Association Committee for the Protection of Medical Research and a survey of women's health interests, a cooperative project with the Woman's Auxiliary to the American Medical Association

Bureau of Legal Medicine and Legislation

Mr. J. W. Holloway Jr., who has served as Acting Director of the Bureau of Legal Medicine and Legislation since the retirement of Dr. William C. Woodward, has been designated as Director

MEDICOLEGAL ABSTRACTS VOLUME 3

The first volume of *Medicolegal Abstracts* was published in 1932 and contained the abstracts that had been printed in *THE JOURNAL* during the calendar years 1926 to 1930 inclusive. The second volume was published in 1936 and contained the abstracts that had appeared in *THE JOURNAL* from 1931 to 1935. A third volume, now in the course of preparation, will include the abstracts that have appeared in *THE JOURNAL* from 1936 through 1940. It has been suggested that the value of these compilations would be greater if abstracts were arranged in accordance with their subject matter. Possibly this would be true. The type for the abstracts, however, is held over the five year period and the difficulty and cost of rearrangement of such a considerable amount of type have not been justified by the limited circulation of the first two volumes of the series. Since every effort has been made to provide an adequate index, the disadvantage of having the abstracts appear in the chronological order in which they were originally printed in *THE JOURNAL* is considerably lessened.

TAXATION OF ACCOUNTS RECEIVABLE

In *THE JOURNAL*, May 24, 1941, page 2426, there was published an abstract of a decision of the United States Supreme Court that focused attention on a problem which confronts the estates of physicians in connection with the payment of income taxes for the year of death. During his life a physician normally reports as income for federal income tax purposes the amounts actually received. By reason of a provision in the income tax law, however, for the year of death there must be reported not only the actual amount received but also a fair appraisal of the outstanding accounts on the books of the tax-

payer. The result of this requirement is that the reportable income for the year of death is artificially built up, bringing into play the higher surtax rates, and the estate of the deceased taxpayer may be subject to considerable strain to provide sufficient funds with which to pay the increased tax that necessarily results. This situation results from an amendment to the income tax law that was passed by the Congress in 1934. Prior to 1934, if a taxpayer died who had been on a cash receipts and disbursements basis for federal income tax purposes, the collectible accounts outstanding on his books at the time of death were not subject to income tax, even when collected.

The injustice of the present method of imposing income taxes on the taxpayer for the year of death has been given consideration by the Treasury Department. At the time this report is being prepared, the House Committee on Ways and Means is giving consideration to the formulation of a new revenue act. On March 3 the Secretary of the Treasury and his tax adviser appeared before that committee with recommendations for the act. The secretary pointed out that wartime rates make it imperative to eliminate as far as possible existing inequities which distort the tax burden on certain taxpayers. If the Congress follows the recommendation of the Treasury Department, an unjust burden will be lifted from the estates of taxpayers who have been on a cash receipts and disbursements basis for income tax purposes, especially the estates of physicians, dentists and other professional men.

Several suggestions as to procedures that a physician may adopt during his lifetime to lighten the income tax load on his estate were discussed in detail in a statement prepared by the Bureau and published in *THE JOURNAL*, Jan. 10, 1942.

PROTECTION OF CIVIL RIGHTS OF PERSONS IN MILITARY SERVICE

During the first world war the Congress passed a measure to protect the civil rights of persons in military service. A similar measure was enacted in 1940 to provide the same type of protection for those now serving. The broad purpose of the law is to free persons in military service from harassment and injury to their civil rights during their term of military service and thus to enable them to devote their entire energy to the defense needs of the nation.

This law applies to all members of the Army, Navy, Marine Corps and Coast Guard, to members of the United States Public Health Service detailed by proper authority for duty with the Army or Navy, and to those in training who are undergoing education under the supervision of the United States preliminary to induction into military service. Civil liabilities are not extinguished by this law, but enforcement is deferred in those cases in which the opportunity and capacity to meet such obligations are impaired by reason of military service. A detailed analysis of the law was published in *THE JOURNAL*, Jan. 24, 1942.

PRIORITIES AND MEDICAL SUPPLIES

The existent emergency has made it necessary that supplies of essential materials be preserved to promote the national welfare. Sources of supply have diminished or disappeared altogether and the accelerating need of raw materials such as chemicals, metals and rubber for war purposes has resulted in an accompanying scarcity for civilian use.

Provision has been made, however, for the release of sufficient material for the production of equipment essential to the delivery of adequate medical care to the civilian population. A copy of the order under which this was accomplished (Preference Rating Order No. P-29) was published in *THE JOURNAL*, Sept. 27, 1941, page 1103. Later a drastic curtailment of the use of rubber for civilian purposes became essential because of the Far Eastern situation. This order prevented the use of rubber for the production of many articles necessary in the practice of medicine. The original rubber order was subsequently modified so that items made of rubber necessary in the practice of medicine could be produced. An analysis of this modifying order was published in *THE JOURNAL*, March 14, page 905. Furthermore, physicians have been given a priority classification in the distribution of automobile tires to the extent that such tires are needed in serving patients. Physicians will, it is hoped and

believed, cooperate with the spirit of the classification that has been accorded them in this respect.

The priority system that has been formulated does not and cannot be expected to function without occasional inadequacies. While the procurement of health supplies has been provided for, difficulty has been experienced by some physicians in obtaining needed repairs to professional equipment because of the fact that Preference Rating Order No. P-100, relating to repairs, maintenance and operating supplies does not cover professional equipment owned by private practitioners of medicine; it does apply to equipment owned by hospitals, clinics and sanatoriums. This matter has been the subject of conferences between a representative of the Bureau of Legal Medicine and Legislation and the Health Supply Section of the War Production Board and it is expected that a solution will be announced shortly.

ADEQUACY OF SUPPLY OF NARCOTICS: RESTRICTIONS ON SALE OF PAREGORIC

Testifying on Dec. 17, 1941 before a subcommittee of the House Committee on Appropriations, H. J. Anslinger, United States Commissioner of Narcotics, expressed the belief that the supply of narcotics in the United States is sufficient to meet demands until 1945. Opium was obtainable from Turkey, he said, but the task of getting it to this country was a difficult one. That difficulty will no doubt increase. Concern was expressed by the commissioner, however, over the extent to which addicts are resorting to the use of paregoric to satisfy addiction, and a depletion of the reserve stock of the drug, built up to take care of military and naval needs and legitimate civilian use, was forecast unless the trend is halted. The commissioner pointed out that the per capita consumption of paregoric in this country is 1,500 per cent greater than it is in Canada, where sales are restricted to sales on prescription. He suggested that Congress will be asked to impose a similar restriction on sales of paregoric in the United States.

On March 25 there was introduced in the Senate a bill, S. 2405, by Senator George of Georgia, entitled "A bill to discharge more effectively the obligations of the United States under certain treaties relating to the manufacture and distribution of narcotic drugs, by providing for domestic control of the production and distribution of the opium poppy and its products, and for other purposes." The bill was introduced at the request of the Treasury Department to control the domestic production of the opium poppy and to insure an adequate supply of narcotic drugs for medicinal purposes in case of national emergency. Heretofore all opium for the manufacture of narcotic drugs has been imported. Present international conditions are of course making it increasingly difficult to obtain opium and, anticipating the possibility that the supply from abroad may be entirely shut off, the Treasury Department proposes in this bill to authorize the production of opium in this country under such strict government supervision as will insure against diversion to nonmedical use. The bill is pending in the Senate Committee on Finance.

COURT DECISIONS OF MEDICAL INTEREST

An ambiguity in the Harrison Narcotic Act concerning record keeping in connection with exempt narcotic preparations was clarified in a recent decision of the U. S. Supreme Court. That act, as far as the more potent narcotic drugs are concerned, excuses a physician from keeping records when he dispenses such drugs to patients on whom he is in personal attendance. With respect to the exempt preparations, the act imposes a duty of recordkeeping on "any manufacturer, producer, compounding, or vendor (including dispensing physicians)" of such preparations. The use of the designation "dispensing physicians" has led to the belief that the act imposes on a physician who dispenses any of the exempt preparations to a patient the duty of keeping a record of the transaction. In the case under discussion the Supreme Court said that Congress by using the words "dispensing physicians" clearly meant to exclude physicians administering to patients whom they personally attend.

The U. S. Supreme Court in another case, an abstract of which was published in *THE JOURNAL*, May 24, 1941, page 2426, upheld the action of the collector of internal revenue in including as income for the year of death a fair appraisal of

the interest of a physician in the accounts on the books of a partnership of which he was a member at the time of his death.

A decision by the Supreme Court of Nebraska clarified the law of that state with respect to the scope of osteopathy. The court said that a statute, such as obtains in Nebraska, granting a licensed osteopath the right to practice osteopathy in all its branches as taught in recognized osteopathic schools does not authorize such licenses to practice outside the recognized field of osteopathy, even if subjects outside the field are taught in such schools.

The Supreme Court of California, in a recent decision, upheld the action of a component county medical society in expelling a physician from membership. The physician involved in the case was charged specifically with a violation of a section of the Principles of Medical Ethics adopted by the society declaring it to be unprofessional for a physician to dispose of his services under conditions that make it impossible to render adequate service to his patient or which interfere with reasonable competition among the physicians of the community. The charges against the physician involved his association with a county hospital. After the state medical association and the Judicial Council of the American Medical Association had sustained the action of the component society in expelling the physician, he appealed to the courts for relief. The California Supreme Court said that the courts are without authority to declare that a medical association is precluded from expelling a member who persists in practices which by the rules of the association, subscribed to in writing by the member, are unethical. Concerning any matter of policy involved in the adoption by the association of rules governing the conduct of members, the court was of the opinion that that was a matter for the membership itself to determine and that, in the absence of any showing that the policy adopted constitutes a violation of law, the courts will not undertake to interfere. Having agreed to be bound by the adopted rules, the court concluded, the physician was precluded from the judicial relief he sought.

FEDERAL LEGISLATION

Certification of Insulin.—The patent on insulin held by the University of Toronto expired on Dec. 23, 1941. Under this patent adequate standards of purity and strength of insulin had been maintained. To continue this protection to the users of the drug, it became necessary that Congress act promptly to pass necessary legislation. Such action was taken, and on December 22 the President signed a bill to amend the Federal Food, Drug and Cosmetic Act by providing for the certification of batches of drugs composed wholly or partly of insulin. The new law is composed of four sections. Section 1 amends the act named so that its prohibitions against forging, counterfeiting, simulating or falsely representing, or using identification devices without proper authority will apply in the case of such identification devices as may be required or authorized for insulin. Section 2 provides that a drug shall be deemed misbranded if it is, or purports to be, or is represented as a drug composed wholly or partly of insulin, unless (1) it is from a batch with respect to which a certificate or release has been issued under regulations to be promulgated by the Federal Security Administrator and (2) such certificate or release is in effect with respect to such drug.

Section 3 directs the Federal Security Administrator to establish, pursuant to regulations, standards of identity, strength, quality and purity for drugs composed wholly or partly of insulin and methods of assay to determine whether batches of such drugs, or packages therefrom, meet the standards prescribed by such regulations for such drugs. If a standard of identity, strength, quality or purity for insulin is set forth in any official compendium, such as the United States Pharmacopeia, the administrator may not prescribe any differing standard. Section 3 also requires the administrator to establish testing and certifying facilities and procedure and to issue certificates for batches meeting the requirements. As over age or improperly packaged or labeled insulin is unsafe, such certificates are to be effective only for the periods prescribed in the regulations, and the certified batches and drugs therefrom are to be protected by such certificate only for the prescribed period or for such part thereof as such drug meets the labeling and

other requirements prescribed in the regulations for the protection of the public.

Authority is contained in section 3 too under which the administrator may determine and set out in the regulations schedules of fees which will cover the cost to the government of equipping and maintaining the facilities and compensating the personnel required for making the tests and assays. Provision was made in this section for the release, prior to the promulgation of regulations, of insulin which, in the administrator's judgment, could be released without risk as to safety and efficacy. This authority was given to the administrator in order to permit him promptly to release batches of insulin which had already been passed by the Insulin Committee of Toronto University as being of the necessary strength, quality and purity, thus avoiding the risk of a shortage. Section 4 of the law is designed to expedite the issuance of initial regulations. It directed the promulgation of the regulations within forty-five days, and they have been so promulgated.

Hospitals, Health Centers and Clinics in Defense Areas.—On June 28, 1941 the President approved a bill to provide for the acquisition of public works made necessary by the defense program. This program, which called for an initial expenditure of \$150,000,000, was considered necessary because of the inability of many communities to cope alone with the demand for public works in the face of a phenomenal growth of population resulting from the expansion of defense industry and enlargement of military reservations and posts. The term "public work" as used in this legislation means any facility necessary for carrying on community life substantially expanded by the national defense program, especially schools, waterworks, sewers, sewage, garbage and refuse disposal facilities, public sanitary facilities, works for the treatment and purification of water, hospitals and other places for the care of the sick, recreational facilities, and streets and access roads.

Whenever the President finds in any area or locality that an acute shortage of public works necessary to the health, safety or welfare of persons engaged in national defense activities exists or impends which would impede national defense activities, and that such public works or equipment cannot otherwise be provided when needed or could not be provided without the imposition of an increased, excessive tax burden or an unusual or excessive increase in the debt limit of the taxing or borrowing authority of the community in which such shortage exists, the Federal Works Administrator will be authorized, among other things, to make loans or grants, or both, to public and private agencies to provide the needed public works. The term "private agency" is defined in the law to mean any private agency no part of the net earnings of which inures to the benefit of any private shareholder or individual. No department or agency of the United States, the law provides, may exercise any supervision or control over any hospital or other place for the care of the sick, which is not owned and operated by the United States, with respect to which any funds have been or may be expended under the law.

Pursuant to this law, projects have been approved for the construction of additional hospital facilities, health centers and clinics in defense areas in many states. The original appropriation was exhausted in the late fall of last year, and an additional \$150,000,000 has been appropriated. Projects are now being approved for construction under the new appropriation.

New Building for Army Medical Library.—On Sept. 24, 1941 the President approved a bill authorizing an appropriation of \$4,750,000 to construct a new building for the Army Medical Library and Museum and to purchase a site on which to construct the building. While the new authorization has been approved by the President, the money authorized by the bill must yet be actually appropriated by the Congress before the site can be acquired and the building constructed. Ordinarily when Congress authorizes an appropriation of money for stated purposes, the actual appropriation of that money follows as a matter of routine, but it now seems probable that the construction of the new building faces further delay.

Prostitution Near Military and Naval Establishments.—On July 11, 1941 the President approved a bill prohibiting prostitution within such reasonable distance of military and naval establishments as the Secretary of War and of the Navy shall

determine to be needful to the efficiency, health and welfare of the Army and Navy. The Secretary of War and of the Navy and the Federal Security Administrator are directed to take such steps as they deem necessary to suppress and prevent violations of this law and to accept the cooperation of the authorities of states and their counties, districts and other political subdivisions in carrying out the purposes of the law. It is specifically provided, however, that nothing in the law shall be construed as conferring on the personnel of the War or Navy Departments or the Federal Security Agency any authority to make criminal investigations, searches, seizures or arrest of civilians charged with violations of the law.

Disease Incidence in Railroad Industry—The Senate on July 22, 1941 agreed to a resolution submitted by Senator Wheeler directing the Railroad Retirement Board to investigate the incidence of injuries and diseases incurred by employees through employment in the railroad industry and the social and economic consequences of such injuries and diseases. The Railroad Retirement Board is to report to the Senate Committee on Interstate Commerce at the earliest practicable time the results of its investigation. The annual report of the Railroad Retirement Board for the fiscal year ended June 30, 1941 indicates that the investigation is under way and that the results when reported to the Senate Committee will provide a basis for legislation on compensation for railroad injuries. The Railroad Retirement Board, with the cooperation of labor and employer organizations, is apparently proceeding to obtain through reports from employers, supplemented by interviews with injured employees, information relating to the following matters: (1) the present cost of industrial accidents to the railroad workers in terms of settlements, judgments, legal fees, court costs, hospital expenses and so on, (2) the estimated cost of a workmen's compensation system and (3) the advantages or disadvantages to the injured employees and to the survivors of deceased employees of the present system of payments for injuries as compared with one or more possible workmen's compensation systems. The Retirement Board has been for some time engaged in the formulation of a workmen's compensation act to apply to employees of the railroad industry, but it is assumed that the completion of the draft will await the results of the investigations now being made.

Federal Aid to Increase Supply of Nurses for Defense—To provide funds to train nurses to meet the need for competent nursing services in connection with the national emergency, a bill approved by the President on July 1, 1941 authorized an appropriation of \$1,200,000. The amount originally appropriated proved to be insufficient, and an additional \$600,000 was authorized for use during the remainder of the present fiscal year. In authorizing this additional appropriation the House Committee on Appropriations said that during the first world war there were thirty thousand trained nurses in the military service. Prior to the outbreak of the present war the estimated need for additional nurses for military services was ten thousand five hundred by June 30, 1942. The committee stated that there is already a shortage of nurses for civilian needs and that the additional appropriation will permit training for about two thousand additional student nurses by enabling many schools to admit second classes this year, and to bring forward the admission of more classes to May or June.

Health in Areas Adjoining Military and Naval Reservations and Plants Engaged in Defense Work—For the fiscal year ending June 30, 1942 the sum of \$1,235,000 was made available to the United States Public Health Service to assist state and local health authorities in health and sanitation activities: (1) in areas adjoining military and naval reservations, (2) in areas where there are concentrations of military and naval forces, (3) in areas adjoining government and private industrial plants engaged in defense work and (4) in private industrial plants engaged in defense work. Of the total sum appropriated, approximately \$980,000, it was contemplated would be used in emergency health and sanitation activities in mobilization and war industry areas and the rest of the fund or approximately \$255,000, would be used to accelerate the program of the National Institute of Health in its studies and controls of industrial health hazards. As in the case of the appropriation for the training of nurses, the initial appropriation proved to be

inadequate and an additional \$1,295,000 was made available, principally for malaria control work in the vicinity of concentrations of military and naval personnel. In connection with this supplemental appropriation the Surgeon General of the Public Health Service was authorized to engage in emergency health and sanitation activities in defense areas "independently of the state and local authorities." The original appropriation for these activities was made available to enable the Surgeon General of the Public Health Service to assist state and local health authorities.

Employment of Osteopaths as Interns in Army Hospitals—A bill making appropriations for the military establishment for the fiscal year ending June 30, 1942, approved by the President on June 30, 1941, contained an appropriation "for the pay of interns who are graduates of or have successfully completed at least four years' professional training in reputable schools of medicine or osteopathy and not to exceed \$720 per annum each period." The intern system in Army hospitals was inaugurated shortly after the first world war in order to act as a means of securing physicians for the regular medical corps. In the fall of each year selections are made from fourth year medical students and internships are offered in army hospitals to the selectees each of whom is required to agree that following internship he will accept a commission and will serve for at least three years. The inclusion of the authority to appoint osteopaths as interns was objected to by the War Department on the ground that even if such appointments were made from schools of osteopathy the appointees could not qualify after the internship for commissions in the Medical Corps because they did not meet existing standards. On the recommendation of the War Department the Senate Committee on Appropriations deleted all reference to osteopaths in this particular provision, but on the floor of the Senate the deleted matter was reinserted.

Hospital Facilities for Veterans—During the past twenty-two years the government has made available a total of \$208,723,029 for the construction of hospital and domiciliary facilities for veterans. As of June 30, 1941 there were 61,849 hospital beds under the control of the Veterans' Administration. On the completion of new construction for which funds were available on June 30, 1941 there will be 63,791 hospital beds for veterans. During 1941 the sum of \$3,500,000 was made available for additional construction of hospital facilities and for major improvements at existing facilities. The current annual report of the Veterans' Administration points out that since June 7, 1924, when hospitalization was first authorized for veterans of all wars without regard to the origin of their disabilities, 1,548,675, or about 78 per cent of all admissions, have been for the treatment of disabilities not connected with service.

During the Seventy-Seventh Congress there have been introduced to date some eighteen bills proposing the construction of new veterans' hospitals in designated localities or proposing additions to existing institutions. No action has been taken on any of these bills. Another bill, H. R. 6241, introduced on Dec. 15, 1941 by Representative Rogers of Massachusetts, proposes to authorize such sums as may be necessary to provide sufficient hospital and outpatient dispensary facilities to care for the "rapidly increasing load of disabled veterans" and to enable the Veterans' Administration to care for its beneficiaries in veterans administration facilities rather than in contract temporary facilities and other institutions. This bill is pending in the House Committee on World War Veterans' Legislation. Furthermore, the Independent Offices appropriation bill for the fiscal year ending June 30, 1943, H. R. 6430, which has now passed the House carries an item in the amount of \$4,557,000 for major reconditioning, replacements and new construction of hospitals and domiciliary facilities for veterans. In the course of the hearing on this bill a question arose concerning hospital care of service men participating in the present war. In discussing this question the Administrator of Veterans' Affairs said that there has been much talk concerning the necessity of instituting immediately a large hospital building program and that Congress will undoubtedly be importuned by the veterans of the first world war to provide additional hospital beds at once. These veterans, General Hines stated, fear that the demands for hospitalization on behalf of the men serving in the present conflict will take priority over the hospitalization needs

of veterans of the first world war who are now or may hereafter be hospitalized because of nonservice disabilities. General Hines further said that Congress will be faced with a demand to hospitalize the veterans of the present war on the same basis as veterans of the first world war, that is, for service connected and non-service connected disabilities. The administrator advised against any hasty action in legislating for the second group at the present time. He forecast, however, that eventually hospitalization must be provided for the two groups on the same basis. With nearly eight thousand vacant beds in veterans' hospitals at the present time, however, General Hines did not feel that he could advocate the provision of any considerable number of additional beds immediately.

Chiropractors and United States Employees' Compensation Act.—A subcommittee of the House Committee on the Judiciary on Nov. 19, 1941 recommended to the full committee that the Tolan bill, H. R. 1052, be approved, to authorize chiropractors to treat the beneficiaries of the United States Employees' Compensation Act. The full committee has taken no action on the recommendation of its subcommittee.

Amendments to Soldiers' and Sailors' Civil Relief Act.—This act applies generally to transactions originating prior to its approval date, Oct. 17, 1940. One bill, S. 1842, which has been reported to the Senate with recommendations that it pass, proposes to amend the act to extend its benefits to mortgages and installment contracts originating subsequent to the date named. A companion bill, H. R. 6521, is pending in the House Committee on Military Affairs. The original act provides no relief in connection with leases for offices. A pending bill, S. 1569, which has passed the Senate, provides, among other things, for the termination of any lease covering premises occupied for professional purposes, where the lease has been executed on his own behalf by any person who is in military service by virtue of the provisions of the Selective Training and Service Act or of the joint resolution under which the President was authorized to call out the reserve units. Any such lease, the bill provides, may be terminated on thirty days' notice in writing delivered to the lessor by the lessee. Both the Senate bill and a companion bill, H. R. 4936, are pending in the House Committee on Military Affairs.

Amendments to Social Security Act.—Beginning with the report of the Technical Committee on Medical Care, proposals have been repeatedly advanced to provide federal aid in making disability payments to persons unemployed by reason of illness. The national health bill, sponsored by Senator Wagner several years ago, contained such a proposal. The annual reports of the Social Security Board and the testimony of its chairman before Congressional committees have emphasized the initial recommendation made by the Technical Committee. Whenever the proposal has heretofore been advanced, however, it has been definitely associated with plans to provide medical care to the sick workman to expedite his return to work and thus lessen the period for which cash disability benefits are required.

On Jan. 7, 1942 President Roosevelt in his budget message to the second session of the Seventy-Seventh Congress recommended "an increase in the coverage of old age and survivors' insurance, addition of permanent and temporary disability payments and hospitalization payments beyond the present benefit programs, and liberalization and expansion of unemployment compensation in a uniform national system." While the President made no reference to medical benefits, his recommendation must be considered against the background of governmental points of view expressed during recent years. It merits careful consideration. No bill has yet been introduced to translate the budget proposal into law, and until the details of that bill are known the proposal can be considered only with respect to its general implications. Some of these implications were referred to in an editorial that appeared in THE JOURNAL on March 7: "Disability Insurance and Hospitalization Benefits."

Bills are pending in the Congress awaiting action proposing to extend the federal old age and survivors' insurance benefits of the Social Security Act to certain employees of religious, charitable, scientific, literary or educational organizations, to extend aid to the physically handicapped, to provide financial assistance or other assistance including medical and dental aid

to needy transients, and proposing in other ways either to broaden the base of the act to include other beneficiaries or to provide additional benefits for employees now coming within the scope of the act. One resolution, introduced by Representative Celler of New York, proposes to create a committee of five members of the House of Representatives to study, investigate and report to the House on the proposals that have been made for amendment of the Social Security Act.

STATE LEGISLATION

The legislatures of forty-three states met in regular session in 1941. A brief reference to the more important laws, from the medical point of view, that were enacted in 1941 follows:

Basic Science Laws.—A basic science law was enacted in New Mexico requiring all applicants for licenses to practice any form of the healing art, before presenting themselves to their respective professional boards for examination and licensure, to pass examinations in anatomy, physiology, chemistry, bacteriology and pathology to be given by a board of basic science examiners. This board consists of one doctor of medicine, one osteopath, one chiropractor and "two laymen learned in the basic sciences." A basic science bill passed both houses in Tennessee by substantial majorities but was vetoed by the governor the same day the legislative session ended, thus precluding any efforts to pass it over his veto. The Arkansas Basic Science Act was so amended as to exempt from its provisions "any person who was a resident practitioner of chiropractic on January 15, 1940, and to whom a license to practice chiropractic was issued by the State Board of Chiropractic Examiners prior to that date," thus, in effect, legalizing licenses which had been issued by the chiropractic board to persons who did not possess certificates from the basic science board.

Medical Practice Acts.—Amendments were adopted to the medical practice acts of Arkansas, California, Colorado, Connecticut, Florida, Missouri, Nebraska, New York, North Carolina, Oklahoma, Pennsylvania, Washington and Wisconsin. Of particular interest are provisions that will require licensed physicians in Arkansas, Oklahoma and Washington to register annually with their respective licensing boards and to pay an annual registration fee. Another Arkansas amendment authorizes the court in which a physician is convicted of a crime involving moral turpitude to revoke or suspend his license to practice in the state. At least six different bills to amend the medical practice act were enacted in California, one of them exempting physicians serving in the armed forces from the payment of the required annual registration fee and another authorizing the revocation or suspension of the license of a licensee who fails to use his name in connection with any "advertising of the medical business." A new Colorado law provides for the discontinuance of the licensing of midwives. The new Connecticut law, among other things, clarifies and simplifies the procedure in disciplinary actions. The Florida amendment eliminated those provisions of the prior law that required that of the ten members of the board of examiners five members should be "allopaths," three "eclectics" and two "homeopaths." The New York amendment exempts from the act a physician employee of the United States Veterans Administration while in the performance of his official duties. The North Carolina amendment provides specifically that any person practicing radiology, as defined, shall be deemed to be practicing medicine. Radiology was then defined to include the use of the fluoroscope, radium or roentgen ray for the purpose of examination, demonstration, diagnosis or treatment. The new Pennsylvania law amends the medical practice act in several important respects. Among other changes it redefined the practice of "medicine and surgery" as "the art and science having for object the cure of diseases of and the preservation of the health of man, including all practice of the healing art with or without drugs except healing by spiritual means or prayer." The term "healing art" was also defined as "the science of diagnosis and treatment, in any manner whatsoever, of disease or any ailment of the human body."

Cult Practice Acts.—A new Arizona law provides a separate practice act for the osteopaths, who are hereafter to be examined and licensed by an independent osteopathic board. Under the

prior law, osteopaths were licensed under the medical practice act by the board of medical examiners. Amendments to existing osteopathic practice acts were enacted in Arkansas, Georgia, North Dakota, Vermont and Wisconsin. The Georgia amendment specifically confers on osteopaths the right to utilize narcotic drugs in connection with their practice. The North Dakota amendment requires an osteopath to renew his license annually and conditions renewal on the payment of a fee of \$3 and proof that in the preceding year he has attended at least two days of the annual educational program and meeting conducted by the state osteopathic association, or its equivalent. The Vermont amendment requires osteopathic applicants to have graduated at schools of osteopathy after a four years course of nine months each rather than after a three years course of nine months each, as the previous law required. The Wisconsin amendment will require after June 1948 that applicants for licenses to practice osteopathy and surgery, in addition to present requirements, present satisfactory evidence of having completed two years of college work including physics, chemistry, biology and English in an institution accredited by the University of Wisconsin.

Existing chiropractic practice acts were amended in North Dakota, Oregon and Tennessee. The Oregon amendment, among other things, specifically proscribes the practice of naturopathy by chiropractors and imposes additional requirements on applicants for licenses. In Tennessee the amendment will permit chiropractors to palpate, analyze and adjust by hand tissues adjacent to the spinal column in addition to articulations of the spine. It provides too, as does the North Dakota amendment, that annual renewal of a license is to be conditioned on proof that the holder has attended in the preceding year the educational program arranged by the state chiropractic association.

In South Carolina a new law permits naturopaths to "use and practice phytotherapy [sic], minor surgery, obstetrics and gynecology, autotherapy and biologicals."

Medical Service Plans.—New California, Massachusetts and Ohio laws authorize nonprofit corporations to establish and operate voluntary nonprofit medical service plans whereby medical services will be provided at the expense of such corporations to such persons or groups of persons as subscribe to plans which entitle each subscriber to certain professional services by licensed physicians and surgeons in their offices, in hospitals and in the home.

Hospital Service Plans.—Laws were adopted in Kansas, Minnesota, Nebraska and North Carolina to permit nonprofit corporations to operate hospital service plans whereby hospital care may be provided by the corporations or by hospitals with which they have contracts for such care to persons who subscribe to plans which entitle each subscriber and his dependents to certain hospital care.

Premarital Examination Laws.—Laws were enacted in Iowa, Maine, Ohio, Utah and Vermont to require each party to a proposed marriage as a condition precedent to obtaining a license to marry to present a physician's certificate that he or she is free of syphilis or is not in a stage of that disease that can be transmitted to the marital partner. The Utah law in addition requires each party to be free from any venereal disease in a communicable stage. A bill similar to the Utah law was vetoed by the governor of Wyoming. A new Massachusetts law requires each applicant for a license to marry to present a physician's certificate that he has examined the applicant for evidence of any infectious disease declared by the state department of health to be dangerous to public health and that he has informed both parties to the proposed marriage of any disease detected. However, even if such a disease is found the parties may marry.

Antepartum Examinations.—Laws were enacted in California, Connecticut, Missouri, Nevada, Oregon, Utah, Vermont and Wyoming requiring a physician or other person engaged in the antepartum care of a pregnant woman, or attending at the time of delivery, to obtain a specimen of her blood at the time of the first professional visit or within ten days thereafter and to submit it to an approved laboratory for a standard serologic test for syphilis.

Narcotic Drugs.—What is cited as the Uniform Narcotic Drug Act was enacted in Maine in 1941. A similar bill was killed in New Hampshire.

The Uniform Narcotic Drug Acts of Arkansas, Florida, Iowa, Maryland, Minnesota, Montana, Nebraska, New York, Oregon, Rhode Island, South Dakota, Tennessee, Texas and Wisconsin were so amended as to provide that the act shall not apply to administering, dispensing or selling at retail any medicinal preparations that contain in 1 fluidounce or, if a solid or semi-solid preparation, in 1 avoirdupois ounce, not more than 1 grain of codeine or any of its salts. Under the Uniform Narcotic Drug Act a preparation is exempted if it does not contain in the quantities referred to more than 2 grains of opium, $\frac{1}{4}$ grain of morphine, 1 grain of codeine or $\frac{1}{8}$ grain of heroin. The Tennessee amendment also exempts preparations in the quantities stated that do not contain more than 2 grains of opium.

Summary

Medicolegal Abstracts.—A third volume of Medicolegal Abstracts, including those that appeared in The Journal from 1936 to 1940 inclusive, is in the course of preparation and will be published soon.

Taxation of Accounts Receivable.—Under existing law, the estate of a physician may be subject to strain to pay income tax for the year of the physician's death because of the fact that uncollected accounts must be included as income. The Treasury Department has recommended that Congress relieve the estates of taxpayers of this burden by changing the law so as to make the outstanding accounts on the books of a taxpayer at the time of his death taxable as collected.

Protection of Civil Rights of Persons in Military Service.—As more physicians enter military service, the provisions of the Soldiers' and Sailors' Civil Relief Act of 1940 assume greater importance to the profession. The broad purpose of this act is to free persons in military service from harassment and injury to their civil rights during the term of military service and thus to enable them to devote their entire energy to the defense needs of the nation. Pending legislation proposes further to extend the benefits of the act.

Priorities and Medical Practice.—War has made it necessary that supplies of essential materials be preserved to promote the national welfare. That necessity has brought in its wake a scarcity of certain materials for civilian use. Provision has been made, however, for the release of material for the production of equipment essential to the delivery of adequate medical care to the civilian population. Physicians have been given a preferred classification in the distribution of automobile tires, but only to the extent that such tires are needed in serving patients.

Adequacy of Supply of Narcotics.—The United States Commissioner of Narcotics believes that the supply of narcotics on hand is sufficient to meet demands until 1945 but expresses concern over the extent to which paregoric is being used by narcotic addicts. He forecasts a shortage in that drug if this trend is not halted and proposes that sales of paregoric be limited to sales on prescription.

Court Decisions of Medical Interest.—The United States Supreme Court holds that physicians who dispense attenuated narcotic preparations need keep no record of the transaction. That court also focused attention on the requirement that accounts on the books of a physician at the time of death are taxable under the income tax law. The Supreme Court of Nebraska clarified the law of that state with respect to the scope of osteopathy. The Supreme Court of California upheld the action of a component county medical society in expelling a member for infraction of the rules of professional conduct adopted by the society.

Federal Legislation.—A law has been enacted to safeguard the users of insulin. This legislation was necessary because of the expiration of the insulin patent under

which adequate standards of purity and strength of the preparation had been maintained.

The sum of \$300,000,000 was made available for the construction of community facilities in defense areas, including hospitals, clinics and sanatoriums.

While an appropriation has been authorized to construct a new building for the Army Medical Library and to purchase a site, the authorized sum has not been made available. Indications are that the completion of plans for the new building will be deferred until after the present emergency.

The better control of the incidence of venereal diseases among the armed forces was the objective of a law prohibiting prostitution within such reasonable distance of military and naval establishments as the Secretary of War and of the Navy shall determine to be needful to the efficiency, health and welfare of the Army and Navy.

The Railroad Retirement Board, under a resolution adopted by the Senate, is investigating the incidence of injuries and diseases incurred by railroad employees. The information is being assembled to form the basis of workmen's compensation legislation covering employees of the industry.

Federal appropriations have been made available to train additional nurses to meet the needs of the emergency and to enable the Public Health Service, either independently or in cooperation with local health authorities, to engage in health and sanitation activities in defense areas.

The employment of osteopaths as interns in army hospitals was authorized, but the War Department has not yet availed itself of that privilege. A subcommittee has recommended favorably a bill to permit chiropractors to treat beneficiaries of the United States Employees' Compensation Act, but the full committee has not followed the recommendation of its subcommittee.

Demands persist for the construction of additional hospital facilities for veterans. Seventy-eight per cent of all admissions to veterans' hospitals since 1924 have been for treatment of disabilities not connected with the service.

The budget message of the President recommended disability and hospitalization payments to workmen unemployed by reason of illness. No bill has yet been introduced to translate this recommendation into legislation, but it merits careful consideration against the background of prior governmental points of view expressed during recent years associating the supplying of medical care with the granting of temporary disability benefits during illness. Bills are pending to broaden the base of the Social Security Act to include employees now excluded and to grant additional benefits to employees now covered by the act.

State Legislation.—A new basic science act was enacted in New Mexico. The legislature of Tennessee passed such an act, but it was vetoed by the governor. The basic science act of Arkansas was amended to exempt chiropractors who were licensed prior to Jan. 15, 1940.

Medical practice acts were amended in Arkansas, California, Colorado, Connecticut, Florida, Missouri, Nebraska, New York, North Carolina, Oklahoma, Pennsylvania, Washington and Wisconsin. A new osteopathic act was enacted in Arizona, and existing acts were amended in Arkansas, Georgia, North Dakota and Vermont. Amendments to the chiropractic acts were enacted in North Dakota, Oregon and Tennessee and to the naturopathic practice act in South Carolina.

Laws to authorize medical service plans were enacted in California, Massachusetts and Ohio, and similar enabling laws were enacted in Kansas, Minnesota, Nebraska and North Carolina to authorize the operation of hospital service plans.

Premarital examination laws were enacted in Iowa, Maine, Massachusetts, Ohio, Utah and Vermont. Antepartum examination laws were enacted in California, Connecticut, Missouri, Nevada, Oregon, Utah, Vermont and Wyoming.

A uniform narcotic drug act was enacted in Maine. The narcotic laws of Arkansas, Florida, Iowa, Maryland, Minnesota, Montana, Nebraska, New York, Oregon, Rhode Island, South Dakota, Tennessee, Texas and Wisconsin were amended to bring within the purview of such acts the attenuated narcotic preparations with the exception of preparations that contain in 1 fluidounce or, if a solid or semisolid preparation, in 1 avoirdupois ounce, not more than 1 grain of codeine or any of its salts.

Bureau of Medical Economics

The census of physicians for the Committee on Medical Preparedness, assigned to the Bureau of Medical Economics in June 1940, continued to engage the entire time of most of the Bureau staff during 1941. The most essential work in medical economics was carried on by one associate, one stenographer and one clerk with some assistance from other personnel. The urgent demands of the medical preparedness program precluded the development of much new work in medical economics and created difficulty in maintaining the routine of the Bureau.

SURVEY OF MEDICAL PERSONNEL

The census of physicians began in June 1940. By July 16, 1940 medical preparedness schedules had been mailed to all physicians in the United States and its dependencies whose addresses were available. At this time 179,796 physicians were asked to provide the Committee on Medical Preparedness with information that could be used to classify physicians for military, civilian and industrial medical care.

Subsequent to the original mailing, approximately 6,000 schedules were sent to recently graduated or licensed physicians and others who for one reason or another were not included in the first mailing. Thus, a total of about 185,800 physicians received medical preparedness schedules. By Dec. 31, 1941 approximately 158,000, or about 85.8 per cent of the total number of those who received schedules, had filled in the information and returned the schedules to the Committee on Medical Preparedness in Chicago.

Since it was necessary to have a punch card of information for each known physician in the United States and its dependencies, the 85.8 per cent return left the original task 14.2 per cent short of completion. It was evident at about the middle of 1941 that some physicians for various reasons would not provide the committee with the desired information, and arrangements were made to prepare incomplete schedules for all who did not fill out a schedule themselves. Some of these incomplete schedules were filled in by the secretarial staffs of state or county medical societies, but most of them were prepared in the Bureau of Medical Economics.

At the close of 1941, either a complete schedule had been received or an incomplete schedule had been prepared for every known physician in the United States and its possessions. All these schedules have been edited and coded and the information placed on punch cards.

The original list is being revised continuously by the addition of the names of new physicians and the removal of the names of deceased physicians. Other revisions that must be made continuously are changes of physicians' qualifications and addresses and the designation of physicians who have been placed on active duty with the armed forces.

An extremely important service in connection with the census of physicians is the voluntary work of many prominent physicians who have quietly but painstakingly assembled confidential information relative to the professional qualifications of both specialists and general practitioners. This work has been completed for nearly 100,000 physicians and will continue until all lists have been completed. Because of the highly confidential nature of this information, these reports will not be published or made available for any except official purposes.

SPECIAL LISTS

Some of the lists that have been and are now being prepared for use in connection with military and civilian medical services are:

- Specialists by states.
- General practitioners by states.
- Commissioned officers by states and corps areas.
- Negro physicians by states.
- Specialists by year of birth and states.
- An alphabetical listing of all physicians.
- A geographic listing of all physicians.

Other lists that are being maintained for use in connection with Medical Preparedness and the Procurement and Assignment Service are:

- Essential members of the faculties of medical schools.
- Physicians reported by county and state medical societies as essential for the maintenance of the health of the local communities.
- Physicians now on active duty with the armed forces arranged by the states from which they entered the service.
- Refugee physicians.
- Graduates of unapproved medical schools.
- Physicians serving in some capacity with the Selective Service System.
- Changes of addresses.

Since all these lists require continuous checking and change, it should be evident that the census process is a continuing one which must be maintained to provide the latest and most reliable data pertaining to physicians in the work of procuring, assigning and conserving the medical resources of the United States.

The accumulation of data pertaining to the medical profession was undertaken primarily to provide information that would be useful to the Army and Navy in securing commissioned medical personnel. To accomplish this purpose it became necessary to secure lists of commissioned medical officers on duty and information from the surgeon generals of the Army and Navy to show the estimated requirements of commissioned medical personnel, the number and names of physicians who had been ordered to extended active duty and the names of physicians who had been considered for commissions but who, for some reason, had been rejected. It became necessary also to secure interpretations of and changes in regulations, copies of directives, and comments on policies of the medical departments of both the Army and the Navy.

Any report concerning the medical preparedness activities of the American Medical Association as conducted through the Bureau of Medical Economics would be incomplete and lacking in appreciation if it failed to acknowledge the complete, free and sympathetic cooperation that has been given by the surgeon generals of the Army and Navy and their administrative staffs and by other officials of the federal government.

COOPERATION WITH THE PROCUREMENT AND ASSIGNMENT SERVICE

In October 1941 the President of the United States approved the creation of the Procurement and Assignment Service as a part of the Office of Defense Health and Welfare Services. The function of the service is stated as follows:

The function of this office shall be to procure personnel from existing qualified members of the professions concerned. The office shall receive from various governmental and other agencies requests for medical, dental and veterinary personnel. These requests shall indicate the number of men desired, the time during which they must be secured, the qualifications and limitations placed on such personnel.

The office must then by appropriate mechanism arrange to secure lists of professional personnel available to meet these requirements, utilizing such existing rosters, public and private, as it may find acceptable. It shall also be authorized to approach such professional personnel as is considered to be available and to use suitable means to stimulate voluntary enrolment.

The board shall be authorized to establish such advisory committees and subcommittees as may be necessary. These committees shall represent the various interests concerned, such as medical, dental and veterinary schools, hospitals, Negro physicians, women physicians, etc. Members of such committees shall serve without salary but shall be entitled to actual and necessary transportation, subsistence and other expenses incidental to the performance of their duties.

To enable the Procurement and Assignment Service to utilize fully the information assembled in the census of physicians by the Committee on Medical Preparedness of the American Medical Association, the Directing Board of the Procurement and Assignment Service established a consultant office at the

headquarters of the American Medical Association in Chicago, and Dr. Rosco G. Leland was appointed as supervisor of the consultant office.

Since the establishment of the Procurement and Assignment Service many lists of physicians' names have been sent to the consultant office for checking and clearance. These names are checked for race, year of birth, school and year of graduation, specialty, if any, and personal information. Information is provided when records indicate that the individual is not a doctor of medicine.

Requests have been received for complete lists of specialists. The preparation of all such lists is extremely time consuming, since the names must first be selected from among all thus far listed and then checked for all available information, after which the latest known addresses are supplied. In many instances it is necessary to trace a physician through four or more directory reports of change of address to supply the last known address. Every possible method of shortening the process of checking has been devised, but the preparation of special lists still consumes an enormous amount of time and it is done as expeditiously as is possible.

PREPAYMENT MEDICAL SERVICE PLANS

At the 1941 session of the House of Delegates, consideration was given to a recommendation relative to the establishment by the Bureau of Medical Economics of some method of coordination and interchange of material pertinent to the administration of prepayment plans for medical care sponsored by medical societies. An additional member of the staff of the Bureau was secured for this purpose.

Forms for the collection of experience data from prepayment medical care plans were developed and used in one state in 1939. In August 1941 these forms were revised and sent to the administrative officers of the prepaid medical care organizations sponsored by medical societies, with the request that suggestions for any changes in the forms be returned to the Bureau. The suggestions that were received were incorporated in further revisions of the forms, which were again distributed about the middle of December 1941 to the officers of the medical care plans for further study and comment.

The purpose of these forms was set forth in an explanatory statement which accompanied them and also in the letter of transmittal, and they were finally prepared for use.

As rapidly as experience data are received by the Bureau, they will be analyzed, consolidated and prepared for use by medical societies that contemplate the development of similar prepaid medical services. The Bureau of Medical Economics will then become a clearing point for factual data pertaining to organization, administration, types of coverage, incidence of demand for service, costs and methods of payment of services made available on a prepayment basis and sponsored by medical societies.

The tendency toward the inclusion of medical services in group hospitalization plans has been discussed in previous reports of this bureau. Proposals for ward care plans and for the consolidation of medical services and group hospitalization plans have been offered. These matters will, no doubt, be subject to careful study and consideration by the House of Delegates.

In most places where medical society sponsored plans have demonstrated a reasonable determination to attempt a solution of the problem of the distribution of medical services to the low income groups, no definite efforts to combine the benefits of medical and group hospitalization contracts have as yet culminated.

The House of Delegates has adopted principles to apply in the organization and administration of medical services and of hospital services. It is believed that these principles are sound and deserve more strict adherence.

No valid reason has been advanced to show that medical service organizations and group hospitalization plans cannot function separately as parallel services in communities that are sufficiently interested to support such efforts.

A new development in the group hospitalization movement is a proposal to make available under the Social Security Act a cash allowance of \$3 a day hospitalization benefit to employees

covered by the act who are unemployed because of sickness and who are in need of hospitalization.

The Wagner health bill, intended to implement the national health program, contained a provision to make available benefits to employees during the period of unemployment because of sickness. The House of Delegates, with some limitations as to the method of application, endorsed the principle of insurance against the loss of wages during sickness.

The present proposal has not progressed to a point of definite details that can be discussed specifically. However, this new movement seems to warrant the most careful consideration. It seems proper to inquire at this time whether an entirely new system of hospitalization is to be developed for employees entitled to benefits under the Social Security Act, or whether the present group hospitalization organizations are to be recognized or absorbed and expanded under proposed legislative enactments.

INDEX AND DIGEST OF OFFICIAL ACTIONS

In response to a demand for a convenient abstract of the official actions of the House of Delegates consolidated by subjects to include several years, the first edition of the Index and Digest of Official Actions of the American Medical Association was published in March 1934. This edition covered the years 1904 to 1933 inclusive. A supplement for the years 1934-1936 inclusive was published in 1937. A second supplement for the years 1937-1939 was published in 1940.

Although the arrangement of the material in each published group was alphabetical by subjects, the inconvenience and impracticability of assembling the abstracts in an ever increasing number of supplements became very clear. Accordingly, in 1941 all material that had been published, including the actions at the 1941 session of the House of Delegates, was rearranged and assembled in one volume arranged alphabetically. This volume comprises three hundred and twenty pages cut and punched to fit the loose-leaf binders that have been provided for the original publications. The new material, which is now ready for distribution, will be substituted for the sheets that are now being used.

It is recommended that in the future the Index and Digest be published in volumes rather than supplements, which accumulate as parts of one volume. The present rearranged sheets, which include the years 1904-1941 inclusive, would become volume I. Volume II would begin with the actions of the 1942 session and extend as far in the future as it seemed advisable, depending on the amount of material included in the Digest. Such an arrangement would facilitate the use of the material since the volumes would be kept small, but the arrangement in each volume would be similar.

PROGRAM OF FARM SECURITY ADMINISTRATION

A statement from Dr. R. C. Williams, chief medical officer in charge of the medical program for the Farm Security Administration, indicates that at present there are medical care plans sponsored by the Farm Security Administration operating in more than nine hundred counties in thirty-seven states. That program involves more than one hundred thousand families and includes more than half a million persons.

Quoting from Dr. Williams' statement:

As a result of much study and extended conferences, the desire has been expressed in several areas to undertake a program in an average rural county that would secure reasonably adequate medical care for all farm families in the county who desire to participate in the group medical care plan. Although, in general, any such experimental program would be patterned after the plan developed by the Farm Security Administration in cooperation with the organized medical profession, the program would endeavor to provide more complete care, including the correction of chronic physical handicaps that interfere with farm or household work, and a limited amount of dental service.

The thought is that the experimental county program would be a voluntary health insurance plan for all farm families in the county. This plan would be worked out between the county agricultural planning committee and the county medical society.

This proposal deserves the most careful consideration on the part of the House of Delegates, since it involves several subjects that have been previously considered but under somewhat different circumstances.

Such a program also deserves careful study in the light of some reports from rural areas to the effect that conditions

within those areas have changed in recent months and because of these changes, which appear to be improvements, emergency measures in the distribution of medical services do not appear to be longer needed.

PUBLICATIONS

During 1941 two of the publications of the Bureau were entirely rewritten. These titles are "Health Insurance in England" and "Basic Principles of Medical Economics." One publication, "Organized Payments for Medical Services," was completely revised.

Summary

In 1941 the medical preparedness work required the entire time of most of the personnel of the Bureau of Medical Economics. The initial part of the census of physicians was completed. There are now available for use 181,530 punch cards, which carry a large amount of information pertaining to the physicians of the United States. The census requires a continuing process to keep the information as nearly up to date and accurate as possible.

The Procurement and Assignment Service was created by order of the President in October 1941. The organization of this service included a consultation office at the headquarters of the American Medical Association in Chicago. Dr. R. G. Leland was appointed supervisor of the consultant office.

In compliance with the action of the House of Delegates in 1940, an additional member of the staff of the Bureau was secured and forms have been devised and put in use to secure data pertaining to the operation of medical service plans sponsored by medical societies.

The Index and Digest of Official Actions of the American Medical Association has been brought up to date in a single volume arranged alphabetically to include the original volume and the three supplements.

Developments in the field of group hospitalization have shown definite proposals to consolidate medical service contracts and group hospitalization contracts.

A proposal has been made to modify the Social Security Act to make available to employees covered by the act a cash benefit of \$3 a day hospitalization allowance. The details of this proposal are still too meager to permit any detailed discussion.

The Farm Security Administration medical care program is now operating in more than nine hundred counties in thirty-seven states. Benefits of this program are available to more than five hundred thousand persons. Reports seem to indicate that in some communities changed conditions make the need for such programs less urgent than they were some time ago.

Bureau of Investigation

The Bureau of Investigation has continued to play its part in the educational activities of the American Medical Association. The work of the Bureau consists primarily in receiving and dispensing information concerning so-called patent medicines, quackery, frauds and faddists.

INQUIRIES RECEIVED

Approximately ten thousand inquiries were submitted to the Bureau during the year covered by this report. These inquiries came from physicians, individual laymen, governmental agencies, Better Business Bureaus, commercial organizations, newspapers, radio stations and high school and college students.

The number of inquiries received from physicians has gradually decreased within the last three or four years. Four thousand such inquiries were received by the Bureau in 1938, while there were only two thousand five hundred in 1941. It is presumed that the decrease in the number of inquiries received annually from physicians is due to the fact that, under the provisions of laws enacted within the last few years, active ingredients of products for which claims of therapeutic efficiency are made must be declared on labels, and thus it is no longer necessary for physicians to inquire as they formerly did with respect to the composition of such products.

There has been a constant increase in the number of inquiries received from teachers and students. In 1940 the number of such inquiries was more than twice the number received in the preceding year, and this level was maintained in 1941. The explanation seems to be that high schools and colleges throughout the country have developed "consumer studies" to a rather remarkable extent. In 1939 inquiries from students represented 12 per cent of the total number presented to the Bureau, whereas in 1941 such inquiries represented 27 per cent of the total. It is gratifying to note that the interest of students in high schools and colleges has been so greatly aroused and that the Bureau of Investigation is being given opportunity to contribute to the education of the younger groups of the population with respect to the dangers of fraud and quackery in medicine.

Inquiries from newspapers, magazines, government agencies and Better Business Bureaus have been constant in amount during the last several years. In numerous instances, questions submitted to the Bureau pertain to more than one subject. Those subjects about which most inquiries are received are so-called cures for cancer, epilepsy and diabetes, coal tar drugs, cathartics and products widely advertised as being effective in the treatment of colds. A relatively large number of inquiries pertain to the activities of individuals and groups who resort to the use of more or less sensational advertising methods.

OTHER ACTIVITIES

The Bureau of Investigation has prepared a considerable amount of material for publication in *THE JOURNAL*. Some three thousand of the Bureau's pamphlets were distributed during the year. Lantern slides and a film strip of available slides have been supplied for use for educational purposes by physicians, teachers and others.

The Director of the Bureau during the year delivered addresses before fourteen lay audiences and professional groups under the sponsorship of medical societies and of state or county auxiliaries of the Woman's Auxiliary to the American Medical Association.

The Bureau of Investigation has cooperated as fully as opportunity has offered with agencies of the federal government, including the Federal Trade Commission, the Food and Drug Administration and the Postoffice Department.

Summary

The Bureau of Investigation continued during 1941 to play its part in the educational activities of the American Medical Association.

Approximately ten thousand inquiries from physicians, laymen, governmental agencies, Better Business Bureaus, commercial organizations, newspapers, radio stations and high school and college students were submitted to the Bureau in 1941. The number of inquiries received from physicians has gradually decreased within the last few years, but there has been a constant increase in the number of inquiries received from teachers and students. The subjects about which inquiries were most numerous during the year were so-called cures for cancer, epilepsy and diabetes, coal tar drugs, cathartics and products widely advertised as being effective in the treatment of colds.

Approximately three thousand of the Bureau's pamphlets were distributed during the year, a considerable amount of material was prepared for publication in *The Journal*, and lantern slides and a film strip of available slides were supplied to physicians, teachers and others on request. The Director of the Bureau addressed a number of audiences during the year.

The Bureau of Investigation has cooperated at every opportunity with various agencies of the federal government.

Bureau of Exhibits

The activities of the Bureau of Exhibits during 1941 comprised the Scientific Exhibit at the annual session; exhibits from Association headquarters shown at various state medical meetings and other scientific organizations; exhibits for the public at state fairs, expositions and similar public gatherings, and motion pictures. The year 1941 marked the first time in a

decade when the Bureau was not preparing or maintaining an exhibit at a world's fair.

THE SCIENTIFIC EXHIBIT

The installation of the Scientific Exhibit at the Cleveland session in 1941 was the most attractive in many years. New booth equipment, a new color scheme and fluorescent lighting added materially to the attractiveness of the display, while the commodious hall allowed ample space for the free movement of visitors. Likewise the caliber of the exhibits presented, the energy and perseverance of the demonstrators and the enthusiasm of the visiting physicians attested the high place which the Scientific Exhibit has reached as an instrument in graduate medical education.

There were three hundred and ten signed applications for exhibit space at the Cleveland session, of which one hundred and sixty-nine were accepted. Sixteen sections of the Scientific Assembly were all represented, the largest number of exhibits presented by any one section being twenty-six and the smallest number five.

One of the features of the Scientific Exhibit was a group of exhibits on national defense and war medicine, which was popular as well as timely.

The special exhibit on fractures was carried on under the direction of the same committee as previously, of which Dr. Kellogg Speed, Chicago, was chairman. The special exhibit on lame backs, somewhat larger than in the previous year, was presented for the second time under the auspices of the same committee, of which Dr. Frank R. Ober, Boston, was chairman.

The so-called educational group of exhibits consisting of presentations shown in the names of various national organizations and government agencies was eliminated for the first time in many years. At the Cleveland session each exhibit in this group was shown in the name of the person who demonstrated the exhibit.

Motion pictures were eliminated from the booths of the exhibitors at the Cleveland session and were shown in motion picture theaters only. Six motion picture theaters were maintained simultaneously and continuously throughout the week, with chairmen to introduce physicians who wished to explain their pictures and professional operators to project the films. The pictures were shown once each day.

The Committee on Awards, of which Dr. Walter M. Simpson, Dayton, Ohio, was chairman, worked faithfully and well, spending long hours each day visiting the exhibits and deciding the awards. The number of awards given this year totaled forty: two gold medals, two silver medals, two bronze medals, twelve certificates of merit and three special mentions.

ASSOCIATION EXHIBITS

There are thirty-nine exhibits available for loan purposes, of which fifteen are serviceable primarily for medical societies and scientific groups, eighteen for fairs and expositions and other public gatherings and six for either group with minor variations on emphasis. During 1941 thirteen exhibits were discontinued and seven new exhibits added. Exhibit material was sent out on one hundred and twenty-one occasions, the total number of exhibits being two hundred and twenty-four, since in some instances more than one exhibit was sent. In two states, California and Nebraska, the exhibits were used at numerous county fairs under the auspices of the respective state medical associations, considerably increasing the number of showings mentioned. The medical group of exhibits was sent out on fifty occasions, while those for the public were sent out on seventy-one occasions. The exhibits were shown in thirty states and the District of Columbia.

In accordance with the resolution adopted by the House of Delegates at the New York session of the American Medical Association in 1940, there has been active cooperation between the Bureau of Exhibits and the various health museums over the country. Exhibit material has been lent on a temporary or a semipermanent basis during the year to the museums in Cleveland; Chicago; Toledo, Ohio; Grand Rapids, Mich.; Newark, N. J.; Pittsburgh; Madison, Wis., and New York City. At the Chicago Museum of Science and Industry and at the Cleveland Health Museum a question and answer service was main-

tained, the answers to the questions being sent out by mail from the Bureau of Health Education of the American Medical Association.

MOTION PICTURES

There are twenty-three motion pictures available for loan purposes from the American Medical Association. Two new pictures were added during the year. Films were sent out to thirty states and to the District of Columbia, Hawaii and Canada on two hundred and seven occasions. In many instances two or more pictures were sent to the same place. The pictures were often shown to several audiences before they were returned, considerably increasing the number of showings. Requests for information concerning motion pictures were numerous, and an endeavor was made to inform the inquirers where pictures on certain subjects could be obtained.

Summary

The Scientific Exhibit at the Cleveland session in 1941 was notable for its attractiveness and for the high caliber of the exhibits presented. There were one hundred and sixty-nine individual exhibits and two special exhibits on fractures and lame backs. Six motion picture theaters were in continuous operation.

The loan exhibits of the Association number thirty-nine. They were sent out on one hundred and twenty-one occasions, the total number of exhibits being two hundred and twenty-four, since more than one exhibit was sent to some places.

Museums have been the recipients of health exhibits on a temporary or semipermanent basis. Question and answer services are maintained at the Chicago Museum of Science and Industry and at the Cleveland Health Museum.

There are twenty-three motion pictures in the loan collection of the Association, which are in constant demand. They were sent out to thirty states and to the District of Columbia, Hawaii and Canada on two hundred and seven occasions. In many instances two or more pictures were sent to the same place. Hundreds of requests for information concerning motion pictures on particular subjects were received.

Medicine and the War

Every officer, council, bureau and department of the American Medical Association, indeed the entire personnel of the headquarters office, are participating in the war effort of the nation. The publications of the Association, particularly *THE JOURNAL*, *HYGEIA* and *WAR MEDICINE*, are devoting largely of their space to the contribution of medicine in the war.

COMMITTEE ON MEDICAL PREPAREDNESS AND PROCUREMENT AND ASSIGNMENT SERVICE

The Committee on Medical Preparedness of the American Medical Association met in Washington, D. C., Aug. 19 and 20, 1941 to consider the resolution adopted by the House of Delegates at the annual session in Cleveland relative to the establishment of a procurement and assignment agency, to be concerned with the provision of medical personnel for the Army, Navy, Public Health Service and other governmental agencies. The committee at that time considered also other problems of medical service, including the inventory of the medical profession, deferment of medical students, interns and residents, provision of personnel for Selective Service boards and rehabilitation. In association with the committee at that time were representatives of the office of the Federal Security Agency, the U. S. Public Health Service, the Health and Medical Committee, the Selective Service System, the surgeon generals of the Army and Navy, and representatives of the personnel divisions of the Army and Navy medical departments.

Following these preliminary considerations, the director of the Office of Defense Health and Welfare, Mr. Paul V. McNutt, called a meeting under the auspices of the Health and Medical Committee, of which Dr. Irvin Abell, chairman of the Committee on Medical Preparedness of the American Medical Association, is also chairman. The Health and Medical Committee, by executive order of the President, Sept. 3, 1941, advises the

director of the Office of Defense Health and Welfare regarding the health and medical aspects of national defense exclusive of medical research and assists in the coordination of health and medical activities affecting national defense. The director of the Office of Defense Health and Welfare is also authorized to appoint advisory committees and subcommittees with respect to particular aspects of health, welfare, nutrition, recreation and related activities.

On Oct. 22, 1941 the Health and Medical Committee called a conference of representatives of all government services with representatives of the Committee on Medical Preparedness of the American Medical Association and various other agencies to consider the action taken by the House of Delegates of the American Medical Association, to wit: "That the United States government be urged to plan and arrange immediately for the establishment of a central authority with representatives of the civilian medical profession, to be known as the Procurement and Assignment Agency for physicians for the Army, Navy and Public Health Service and for the civilian and industrial needs of the nation." At this time a commission was appointed which included the President of the American Medical Association and the Editor of *THE JOURNAL* among others. This commission recommended the establishment of a procurement and assignment service and outlined the procedure for its establishment. On Oct. 30, 1941 a letter from Mr. Paul V. McNutt, director of the Office of Defense Health and Welfare, to the President was approved by the President and constitutes the authority under which the Procurement and Assignment Service operates.

The chairman of the Directing Board of the Procurement and Assignment Service is the President of the American Medical Association, Dr. Frank H. Lahey. The establishment includes a consultant office in the headquarters of the American Medical Association under the supervision of Dr. R. G. Leland. It includes also nine corps area committees with their offices. The chairmen of these corps area committees have been selected in most instances from the membership of the Committee on Medical Preparedness of the American Medical Association. Officials of the Association are active also in the work of the advisory committees.

Following a conference held in Chicago, arrangements were made to supply to the National Roster of Scientific and Specialized Personnel copies of the punch card system developed in the headquarters of the American Medical Association covering the medical profession. A consultant committee to the National Roster includes Drs. Morris Fishbein, R. G. Leland and Olin West.

Following the declaration of war against Japan and Germany, an immediate expansion of the military-naval services was undertaken with increased demand for the enlistment of members of the medical profession. Publication in *THE JOURNAL* of the AMERICAN MEDICAL ASSOCIATION of two special enrolment blanks brought to the Procurement and Assignment Service the names of more than twenty-five thousand physicians who indicated that they would, when notified, apply at once to the Procurement and Assignment Service for commissioning in the Army. By the utilization of these twenty-five thousand replies the immediate needs of the Army and Navy Medical Departments for physicians have been satisfied. During the first week in April 1942 the new enrolment form and questionnaire prepared by the board of the Procurement and Assignment Service and by the National Roster of Scientific and Specialized Personnel was circulated to all the licensed physicians of the United States.

In the functioning of the Procurement and Assignment Service the county and state medical societies and corps area committees act to ascertain the essential character of the services done by physicians in various parts of the country and to advise the Procurement and Assignment Service and the Selective Service boards as to the necessity of such services. Through the consultant office in the headquarters office of the American Medical Association the information there available regarding individual physicians is also supplied to the Procurement and Assignment Service and to the personnel division of the medical departments of the Army and the Navy. The Division of Medical Sciences of the National Research Council through its con-

sultant committees has aided in the evaluation of the physicians who specialize with relation to appointments in the Army and Navy medical departments requiring specialistic service.

PHYSICIANS FOR BRITAIN

Early in 1941 the President of the United States requested a number of medical organizations, including the American Medical Association, to aid the American Red Cross in its effort to comply with the request of the British Red Cross for one thousand physicians to reinforce the British medical services, including the Royal Army Medical Corps and the Emergency Medical Service. The offices of the American Medical Association aided in extending this request to the medical profession and in informing the public about the work to be done. Through the lists available in the headquarters office of the American Medical Association, the names of all physicians under 35 years of age were supplied, and to each of those eligible was sent an application blank. When the United States entered the war in December 1941 this project was considered completed. Indeed, arrangements were made by the medical department of the British army to release to the American army those men who had been assigned to this service, the number being somewhat over one hundred. Twelve women physicians who had been sent to Great Britain are continuing their work in the British medical services.

THE SELECTIVE SERVICE

Up to February 1942 more than twenty-eight thousand physicians had enrolled with various phases of the work of the Selective Service. In the department of THE JOURNAL devoted to Medicine and the War, all official bulletins of the Selective Service System directed especially to the medical profession have been given circulation.

Special consideration has been given to the proposal for prehabilitation of registrants. Information has also been supplied relative to projects for rehabilitation.

At the meeting of the secretaries and editors of state medical societies, Brig. Gen. Lewis B. Hershey, director of the Selective Service System, expressed the appreciation of the Selective Service for the cooperation of the medical profession. He said "I do not possess control of the English language adequate to tell you what the work of anywhere from twenty thousand to fifty thousand of the medical profession of America has done in the last year in Selective Service. . . . I do believe you occupy a peculiar position in the minds of the people. . . . You still do have some of that combination that came from long ago when the medicine man was something a little more than a human being."

Officials of the American Medical Association, including the President, Dr. Frank H. Lahey, the Secretary and General Manager, Dr. Olin West, and the Editor, Dr. Morris Fishbein, attended a conference called by the Selective Service System to consider the possibility of a program for rehabilitation of rejected selectees. The views there expressed have been significant in guiding the development of this project. Eventually such rehabilitation was begun as an experiment in the states of Maryland and Virginia. The offices of the American Medical Association have been of service to the Selective Service System in the listing and evaluation of physicians who are cooperating in the rehabilitation program.

INFORMATIONAL SERVICES

The Library of the American Medical Association, in association with the Editorial Department, has made available to the Medical Department of the U. S. Army foreign and domestic medical periodicals, books and other informational material concerning the medical facilities and the health conditions of various sections of the world into which the Army and Navy of the American government may be sent.

Through the current medical literature department, under Dr. George Halperin, complete bibliographies and abstracts concerned especially with medical problems of aviation, chemical warfare, shock and similar subjects have been prepared. These have been supplied to the special committees of the Office of Scientific Research and Development and of the Division of Medical Sciences of the National Research Council for use in the work which they are conducting. Much of this abstract

material is also made available to the medical profession generally and particularly to the military services through WAR MEDICINE.

CIVILIAN DEFENSE

The offices of the American Medical Association have cooperated fully with the United States Office of Civilian Defense in the extension of information to the medical profession as to its participation. The special medical bulletins of the United States Office of Civilian Defense have been published in full in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. Officials of the Association have on many occasions consulted with Dr. George Baehr, chief medical officer, and with other officials of the Office of Civilian Defense. By action of the Board of Trustees Miss Lois Stice, for several years news editor of publicity assistant in the Editorial Department, was lent to the Office of Civilian Defense to aid in medical extension and has now been associated with that work for almost a year. The offices of the Secretary of the Association have been utilized by the Office of Civilian Defense in special mailings of informational material directly to the officers of state and county medical societies for use by the Office of Civilian Defense in extending its work to the medical profession of the nation.

PERSONNEL OF THE HEADQUARTERS OFFICE

The personnel of the headquarters office of the Association has been rendering many services to governmental agencies in connection with the war effort:

Dr. Olin West, Secretary and General Manager of the American Medical Association, has acted as secretary of the Committee on Medical Preparedness of the American Medical Association, consultant to officials of the Selective Service System and the Office of Defense Health and Welfare, and member of consultant committee, National Roster of Scientific and Specialized Personnel.

Dr. Morris Fishbein, Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, has served as chairman of the Committee on Information, Division of Medical Sciences, National Research Council, consultant to the Medical Committee, Office of Scientific Research and Development, consultant to the Selective Service System and Office of Defense Health and Welfare, chairman of the Committee on Information, Procurement and Assignment Service, editor of WAR MEDICINE and vice chairman of the Medical Committee, Civilian Defense, City of Chicago.

The Bureau of Exhibits has been cooperating with various governmental agencies in the development of exhibits for demonstration at the Atlantic City session in 1942. The director of the Bureau, Dr. Thomas G. Hull, is a member of the Medical Advisory Committee of the Illinois State Council of Defense.

The Council on Industrial Health has been cooperating with the Subcommittee on Industrial Health and Medicine of the Health and Medical Committee in the Office of Defense Health and Welfare. Plans have been developed for coordination of various activities in the field of industrial health for the conservation of personnel, for the stimulation of essential research and for the correlation of regional, state and local agencies concerned with civilian defense and committees on industrial health of state and county medical societies. Information is being disseminated among industrial plants on organization for medical and other services required by sabotage, bombing or other catastrophes.

The Biographic Department and the Bureau of Investigation of the American Medical Association have been developing important information regarding physicians and other personnel in the medical services.

The Bureau of Legal Medicine and Legislation has served in an advisory capacity to several federal agencies with relation to the analysis of laws relating to medical licensure and the acceleration of medical education. A special statement has been developed regarding the civil rights of physicians when they enter military service. The Bureau has also conferred with the War Production Board with reference to priorities for medical equipment.

The Bureau of Health Education has contributed radio programs dealing specifically with medical service in industry

and civilian services for a nation at war. Other broadcasts have concerned nutrition and housing problems in war. Emphasis has been placed on the President's May Day proclamation calling for immunization against smallpox and diphtheria. A special outline and bibliography have been prepared on nutrition for the use of the Woman's Auxiliary in the promotion of classes in nutrition. The following pamphlets have been reprinted from *HYGEIA* and are being widely circulated as a part of the educational program:

Our Selectees Are Healthier, by Lieut. Col. A. C. Koontz.

Health at the Crossroads, by M. R. Kinde.

How Well Do You Know Your First Aid? by K. F. Wells.

The Council on Pharmacy and Chemistry has been of assistance to several agencies in conferences regarding the supply of drugs and in determining which drugs are of established therapeutic value. Several members of the Council have carried the work of the Council directly to some of the consultant committees of the National Research Council. Indeed, practically all the members of this council cooperate with federal agencies and coordinate the work of the Council with governmental projects.

The Council on Foods and Nutrition has also aided through its members in the work of various agencies of the Army and Navy and the National Research Council. The Council has cooperated in the development of recommended daily allowances of dietary essentials and gave its support to the National Nutrition Conference for Defense. Special reports have been issued on nutritionally improved or enriched flour and bread and on the indiscriminate administration of vitamins to workers in industry. Nine of the members of the Council are also members of the Food and Nutrition Board of the National Research Council. One of the members serves as head of the Specifications and Test Unit, Standards Section, of the Office of Price Administration in Washington. The Secretary of the Council, Dr. F. C. Bing, devotes time to service on the Subcommittee on Vegetables, Fats and Fruits and also on the Executive Committee of the Food and Nutrition Board of the National Research Council. He serves also as consultant to the Vitamin Division of the Food and Drug Administration and is on a Chicago committee on nutrition. Another member of the Council's staff, Dr. W. B. Bradley, is on the Victory Garden Committee of the Chicago area.

The Council on Physical Therapy has prepared a Handbook on Amputations and has cooperated with the Subcommittee on Physical Therapy of the National Research Council in the preparation of a Manual of Physical Therapy.

The Department of Press Relations of the headquarters office aids in the dissemination of information to both the medical profession and the public on the Procurement and Assignment Service for Physicians, Dentists and Veterinarians. The head of this department is also active on the publicity committee for the Emergency Medical Services of the Office of Civilian Defense in Chicago. A special edition of the *AMERICAN MEDICAL ASSOCIATION NEWS* containing abstracts of articles and announcements in *WAR MEDICINE* is developed by this department for each issue of *WAR MEDICINE*.

The Bureau of Medical Economics, which was designated to conduct a census of physicians for the Committee on Medical Preparedness, now has a complete alphabetical listing of 181,530 physicians, representing the original circularization of schedules to physicians of the United States and its dependencies. This process is a continuing one in which the names of deceased physicians are removed, the names of new physicians are added, the locations of physicians are changed and the qualifications are modified to represent the most recent and authentic information concerning the physician. The present activities in connection with the census of physicians and all the lists that have been prepared therefrom consist in clearing the names of physicians that are received from the Procurement and Assignment Service. Between Jan. 3 and March 23, 1942 inclusive the Bureau processed for the Procurement and Assignment Service the names of 7,132 physicians. In addition to the lists of names that have been processed, a large number of names have been submitted by telegraph for immediate clearance. The Bureau has also prepared lists of specialists for use in connection with the rehabilitation program admin-

istered by the Selective Service System. More than 5,619 names have been processed and placed on state lists for this purpose. The lists of physicians prepared for use in connection with the Selective Service System rehabilitation program must of necessity be incomplete at the present time, since as yet not all the specialists in the United States have been listed, and names must now be drawn from incomplete lists. The process of preparing these lists is further complicated by the fact that not all physicians on the listing sheets are rated, and it is necessary for the director to enter the rating according to the information that has been supplied. On some of the lists the rating was supplied by the committee that entered the information.

In cooperation with the United States Army, the United States Navy and the Selective Service System, the Council on Medical Education and Hospitals has assisted in securing deferment of medical students and premedical students who are matriculated in approved medical schools until completion of their undergraduate studies and one year of internship. Believing that the further education of a certain number of physicians is vital to the future welfare of the country, the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals have appointed a committee whose chief purpose is to formulate plans whereby a percentage of interns may be given an opportunity to continue their training in the special fields of medicine.

Every effort is being made by the Council in connection with the acceleration of the medical curriculum to speed the production of physicians. For this purpose a liaison committee of the Council and the Association of American Medical Colleges has been appointed. While the Council is of the opinion that the adoption of a program for an accelerated curriculum for approved medical schools is a decision which should be determined by each medical school, it stands ready to assist the individual schools in the reorganization of the undergraduate curriculum to maintain adequate standards of medical education.

In cooperation with the Procurement and Assignment Service the faculties of medical schools have been classified with respect to availability for medical service in national defense. At the request of the War Department, the Council requested all medical schools to advise faculty members considered necessary for the operation of a medical school that they should not serve as a member of an affiliated hospital unit.

In response to a telegram from Dr. George Baehr, medical officer, Office of Civilian Defense, dated Dec. 10, 1941, letters, together with bulletins on national defense, were sent to all hospitals having over twenty-five beds. This was done within twenty-four hours after Dr. Baehr's request was received.

The acute shortage of physical therapy aides reported by the Central Physical Therapy Board of the Office of the Surgeon General of the U. S. Army is being studied by the Council in an effort to determine the number available for service or in training. In this connection the Council has assisted in the establishment of concentrated courses to accelerate production of physical therapy personnel. Aside from the physical therapy studies, the Council has investigated the availability and made an inventory of technical personnel in all hospitals in the United States. This study covers laboratory and x-ray technicians, dietitians, pharmacists, medical record and other librarians, medical stenographers, occupational therapists, dental hygienists and social service workers.

In relation to civilian defense, the Council has studied the availability of blood and plasma banks in hospitals approved for intern training and residencies in specialties.

The Council on Medical Education and Hospitals is represented on the National Committee on Education and Defense, a committee sponsored by the American Council on Education and the National Education Association.

Summary

Every officer, council, bureau and department of the American Medical Association and every member of the headquarters personnel is participating in the war effort of the nation.

Committee on Medical Preparedness.—This committee met with representatives of various government agencies

in Washington, D. C., Aug. 19 and 20, 1941, to consider the resolution adopted by the House of Delegates at the Cleveland session relative to the establishment of an agency for the procurement and assignment of medical personnel for the Army, the Navy, the Public Health Service and other government services.

On Oct. 22, 1941 the Health and Medical Committee of the Federal Security Agency called a conference of representatives of all government services with representatives of the Committee on Medical Preparedness and various other agencies. At this meeting a commission was appointed which recommended an outline of procedure for the establishment of the Procurement and Assignment Service. The President of the United States on Oct. 30, 1941, authorized the establishment of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians under the Office of Defense Health and Welfare Services, of which Mr. Paul V. McNutt is director. The chairman of the directing board of the Procurement and Assignment Service is the President of the American Medical Association, Dr. Frank H. Lahey. The Service includes a consultant office in the headquarters of the American Medical Association under the direction of Dr. R. G. Leland, nine corps area committees and various advisory committees.

Arrangements have been made to supply the National Roster of Scientific and Specialized Personnel, cooperating with the Procurement and Assignment Service, with copies of the punch cards covering the medical profession that have been developed at Association headquarters.

Two special enrolment blanks recently published in The Journal brought to the Procurement and Assignment Service the names of more than twenty-five thousand physicians who indicated that, when notified, they would apply at once for commissions, and the immediate needs of the Army and Navy medical departments have thus been satisfied.

Physicians for Britain.—During 1941 the American Medical Association, at the request of the President of the United States, aided materially in extending to the medical profession the request of the British Red Cross, through the American Red Cross, for one thousand physicians to reinforce the British medical services. When the United States entered the war this project was considered completed, and arrangements were made by the medical department of the British army for the release of more than one hundred American physicians who had been assigned to this service. Twelve American women physicians are continuing their work in the British service.

Selective Service.—Up to February 1942 more than twenty-eight thousand physicians were enrolled in various phases of the work of the Selective Service System. Officials of the American Medical Association attended a conference called by the director of the Selective Service System to consider a possible program for the rehabilitation of rejected selectees. Experimental effort in this direction was begun in Maryland and Virginia.

Civilian Defense.—The American Medical Association has cooperated fully with the Office of Civilian Defense in the extension of information to the medical profession.

Headquarters Personnel.—The Secretary and General Manager of the Association, Dr. Olin West, the Editor of The Journal, Dr. Morris Fishbein, and the Director of the Bureau of Medical Economics, Dr. R. G. Leland, have personally rendered a great deal of service to governmental agencies in connection with the war effort.

The Bureau of Exhibits, the Council on Industrial Health, the Biographic Department, the Bureau of Investigation, the Bureau of Legal Medicine and Legislation, the Bureau of Health Education, the Council on Pharmacy and Chemistry, the Council on Foods and Nutrition, the Council on Physical Therapy, the Department of Press Relations, the Bureau of Medical Economics

and the Council on Medical Education and Hospitals have each cooperated in every possible manner with every government department and have contributed specifically and materially to the furtherance of the nation's war effort.

Committee on American Health Resorts

A meeting of the Committee on American Health Resorts held in January 1941 resulted in decisions to proceed with the preparation of rules for listing acceptable health resorts and the publication of these rules when approved by the Board of Trustees, the preparation of scientific articles to be published in THE JOURNAL and the gathering and compiling of information. An informal conference of members of the Committee was held at Cleveland during the American Medical Association meeting in June.

WORK OF THE COMMITTEE

The office work of the Committee is supervised by Dr. W. W. Bauer, Director of the Bureau of Health Education. During the first six months of 1941 this work consisted largely in the writing of follow-up letters to health resorts in an effort to get as high a percentage of returns as possible from the preliminary questionnaires sent out and in compiling and summarizing information.

Six hundred forty-five questionnaires were sent to an equal number of institutions believed to exist. Of these, two hundred and seventy-seven were returned mostly in a state of incompleteness necessitating much additional correspondence. In the case of two hundred and fifty-eight institutions to which questionnaires were sent, it was developed through various sources that they either had been closed or were not operating as health resorts or, for other reasons, should not be included in the list of institutions possibly eligible for inclusion in a register which might be compiled under the proposed rules of the Committee.

The following analysis concerning medical direction in health resorts has been made:

	Class 1*	Class 2†	Class 3‡
Medical direction (resident)...	32	2	3
Medical direction (nonresident)...	24	0	0
Physicians available...	34	1	1
The number of institutions which require a prescription from a physician or a bath permit...	14		

* Institutions which employ mineral water, mud or both for treatment purposes (these may also employ mineral water for therapeutic drinking in addition).

† Institutions which employ mineral waters for therapeutic drinking only.

‡ Institutions which use the Battle Creek system or a similar system plus climate and sunshine as natural resources—no mineral water, and so on.

RULES OF THE COMMITTEE

The following rules and explanatory matter have been adopted by the Committee and approved by the Board of Trustees:

Recognizing the value of those phases of medical treatment included under the general classification of health resort or spa treatment such as climate, thermal and mineral waters, sea water and peloids (muds) the House of Delegates of the American Medical Association in 1938 authorized the appointment of a Committee on American Health Resorts. This Committee was accordingly appointed by the Trustees.

This Committee first prepared a questionnaire which could be sent to known health resorts asking for information as to their natural therapeutic resources and domiciliary and recreational facilities and, more important, the medical facilities available and the medical supervision of the use of therapeutic facilities available.

A list of health resorts was then compiled from various sources including books, government publications, the records of the American Congress on Physical Therapy, tourist guides and miscellaneous sources.

Through an extensive survey by questionnaire and correspondence a comprehensive list was developed of health resorts in the United States including those with and without medical facilities.

The Committee next proceeded to establish and define certain minimum fundamental standards which would assure the safe and successful use of natural therapeutic resources according to established scientific procedure. These standards have been expressed in the rules, which are subject to modification as experience indicates.

The Committee now plans to offer an opportunity to American health resorts to apply for a listing which the Committee proposes to compile. This listing will include health resorts which comply with the rules of the Committee. Application blanks will be furnished on request addressed to the Committee on American Health Resorts, American Medical Association, 535 North Dearborn Street, Chicago.

On receipt of an application properly filled out the Committee will, with all possible promptness, cause inspection to be made of the applicant's premises and will make such other investigations as the Committee may deem advisable. A report will be compiled, submitted to the applicant and published. If the applicant is found to comply with all the

rules of the Committee, the name of the health resort will be included in the Committee's list during such time as compliance with the rules of the Committee continues.

When any modifications of the rules are deemed necessary, those resorts already listed under rules as previously adopted will be notified promptly and will be given reasonable opportunity to comply with the modified ruling or voluntarily to withdraw from the listing.

RULES

Object of Rules.—The following rules with such amendments as may be added from time to time have been adopted by the Committee on American Health Resorts of the American Medical Association with the primary object of identifying for the medical profession and the public those health resorts which are shown by investigation of their location, climate, personnel and management to merit recognition by the medical profession.

Definition.—A health resort is defined as "an institution which gives major attention to the use of the special climatic and other natural therapeutic resources including mineral waters, peloids, etc., with which it is endowed by reason of its location." While the use of the natural resources is the prime object or purpose of the institution, other remedies may be applied as an adjunct.

List.—American health resorts which are found by the Committee to conform to the letter and spirit of the following rules will, on application approved by the Committee, be placed on a list to be published by the Committee.

RULE 1 Application.—To be considered for inclusion in the Committee's list, formal application must be made to the Committee according to the following formula:

(a) Formal application for consideration should be written on stationery of the applying health resort, addressed to the Secretary of the Committee on American Health Resorts, American Medical Association, 535 North Dearborn Street, Chicago.

(b) This application should be accompanied by complete information on (1) ownership, (2) personnel, (3) equipment, (4) method of operation, (5) method of promotion.

(c) Eight copies each of all recent advertising, descriptive booklets, pamphlets, circulars, promotional form letters and any other promotional matter pertaining to the health value of the resort should be submitted.

(d) All correspondence with the secretary should be in duplicate.

RULE 2 Claims and Advertising.—The claims made for a resort must be acceptable to the Committee, and all advertising material must be presented with applications. A resort will not be listed or retained if the management makes unwarranted, exaggerated or misleading statements in any of its advertising.

RULE 3 Medical Supervision.—Medical supervision must meet with the approval of the Committee and must be of such character as to place proper safeguards about the patient to protect him from mistreatment or dangerous treatment. Institutions which permit attendants or technicians to alter or supplement a physician's prescription or to prescribe treatment without restrictions or medical supervision will not be listed. An institution applying for listing will be scrutinized most carefully as to the character of the safeguards placed about the patient by way of medical supervision and the efficiency and good faith with which the rules governing these needs are enforced.

RULE 4 Inspection.—An institution which makes application cannot be given formal consideration until it has been inspected by an inspector designated for the purpose by the Committee.

RULE 5 Removal from List.—If in the opinion of the Committee a listed institution fails to live up to the letter and spirit of these rules or engages in practices contrary to established scientific procedure, the Committee may remove the institution from the list.

RULE 6 Committee Decision Final.—In making application for inclusion in the Committee's list, the applicant agrees that final decision as to listing, nonlisting or subsequent removal shall rest with the Committee.

SCIENTIFIC PAPERS

Titles were chosen and authors invited to prepare a series of papers on health resorts and health resort therapy for publication in *THE JOURNAL*, and work on these papers is now going forward.

APPLICATION BLANKS

A supply of application blanks to be used by institutions making formal application for listing under the rules of the Committee has been printed and is on hand for distribution as soon as the rules of the Committee have been published.

The Committee on American Health Resorts is composed of Dr. Walter S. McClellan, Acting Chairman, Dr. Euclid M. Smith, Dr. M. B. Jarman, Dr. W. Paul Holbrook and Dr. Frank H. Krusen.

Committee to Study Air Conditioning

The Committee to Study Air Conditioning has as its chief function the continuous appraisal of developments and publications in the field of air conditioning as related to health and the interpretation to the medical profession of their significance. An attempt is made to limit the committee's activities to air conditioning in its strictest sense, but inevitably its work extends into the related fields of ventilation, air exhaust systems, aerial bacteriology, and so on.

During the period covered by this report the chief activity of this committee has been the compilation and digestion of all available records and reports on air conditioning and closely related topics for the five year period ended Jan. 1, 1941. Similar compilations for the year 1941 are now in progress. By classification this committee has available in abstract form extensive material related to all commoner aspects of air conditioning, including such items as ozone in air conditioning, infection in relation to air borne organisms, ventilation of air raid shelters, ventilation of mines, air conditioning of naval vessels and air conditioning of windowless structures. Although no policy exists at this time for ways and means for making such materials available to individual physicians or groups, it is the desire of the committee to cooperate with all physicians through the furnishing on request of whatever materials may be at hand on any specific topic associated with air conditioning.

From time to time the committee, as such or through its members as individuals, prepares timely material on air conditioning, as represented by the article on "The Importance of Clothing in Air Conditioning" by C. P. Yaglou and Anne Messer published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* in October 1941. Under some circumstances the committee will sponsor the publications of noncommittee members when it may be determined that the contents of such publications serve the purposes of the committee in the guidance of the medical profession in air conditioning developments and practices.

Respectfully submitted.

CAREY P. MCCORD, Chairman
WALTER M. SIMPSON.
C. P. YAGLOU.

Committee to Study the Relationship of Medicine and Law

In accordance with the provisions of the resolution submitted to the House of Delegates at the Cleveland session by Dr. W. G. Hippen, delegate from Massachusetts, and approved by the House of Delegates, a Committee to Study the Relationship of Medicine and Law has been appointed. The members of this committee are Dr. Alan R. Moritz, chairman, Boston; Dr. Harrison S. Martland, Newark, N. J.; Dr. E. R. Cunniffe, New York City, and Mr. J. W. Holloway Jr., Chicago.

This committee has held one meeting with members of the Committee on Medico-Legal Problems of the American Bar Association, and progress already has been made toward carrying out the intent of the resolution adopted by the House of Delegates.

Proposed Committee to Confer with Specialty Boards

The resolution submitted to the House of Delegates at the Cleveland session by Dr. L. G. Christian, delegate from Michigan, providing for the appointment of a committee to confer with specialty boards, has received consideration, first by the Executive Committee of the Board of Trustees and later by the Board as a whole.

In view of the nature of conditions created by the war emergencies and because the methods adopted by some of the specialty boards have undergone changes and apparently are subject to further change, the Board of Trustees believes it to be inexpedient to appoint a committee at this time for the purpose indicated in the resolution. It may be desirable, when conditions created by present emergencies have ceased to exist, that such a committee can be appointed with the expectation that more effective plans pertaining to the certification of specialists can be devised.

The United States of America versus the American Medical Association and the Medical Society of the District of Columbia

An appeal was taken in the case of the United States versus the American Medical Association and the Medical Society of the District of Columbia from the verdict rendered after trial before the District Court of the United States for the District of Columbia resulting in a conviction of the American Medical Association and the Medical Society of the District of Columbia. This appeal was heard by the United States Court of Appeals.

for the District of Columbia in February 1942 At the time of preparation of this report, no decision has been announced

- Grant 479, 1937 Tracy J Putnam, Boston City Hospital, \$200, injuries to the cervical portion of the cord
- Grant 480, 1937 Amy L Daniels, State University of Iowa, \$250, relation of fluorine to physiologic function
- Grant 481, 1937 Warren O Nelson, Wayne University College of Medicine, \$200, synthetic androgenic substances
- Grant 503, 1938 R C Robb, Syracuse University College of Medicine, \$800, diseases in twins
- Grant 504, 1938 Wallace M Yater, Georgetown University Medical School, \$500, histopathology of "bundle branch" block
- Grant 510, 1938 Erma A Smith, Iowa State College, \$150, influence of various substances on gastrointestinal motility Smith, Erma A, and Penrod, K E Gastrointestinal Motility in the Albino Rat After Administration of Amphetamine Sulfate, *Proc Soc Exper Biol & Med* 47: 418, 1941
- Grant 518, 1938 Harold D West, Meharry Medical College, \$100, synthesis of *dl* threonine See grant 559, 1939
- Grant 522, 1938 Ludwig A Emge, Stanford University School of Medicine, \$500, relation of sex hormones to tumor growth
- Grant 527, 1938 Alexander Levy, University of Oregon Medical School, \$300, occlusion of the coronary arteries See grant 577, 1940
- Grant 532, 1939 Walter Schiller, Cook County Hospital, Chicago \$200, ovarian tumors Schiller, Walter Liver Cell Fat Necrosis Caused by Pancreatic Reflux, *Surg, Gynec & Obst* 72: 70, 1941
- Grant 533, 1939 Hardy A Kemp and W M Fisher, Baylor University, \$500, venom of southern and southwestern scorpions
- Grant 536, 1939 Catharine Macfarlane, Woman's Medical College of Pennsylvania, \$1,900, value of periodic pelvic examination in detecting cancer of the uterus See grant 494, 1938 Macfarlane, Catharine, Fetterman, Faith S, and Sturgis, Margaret C Report of an Experiment in the Control of Cancer of the Uterus, *Quart Rev*, New York City Cancer Committee, 1941 Macfarlane, Catharine Progress Report on Experiment in Control of Cancer of the Uterus, *Connecticut State M J* 5: 814, 1941 Macfarlane, Catharine Precancerous Lesions of Uterine Cervix, *in Wpomon's J*, July 1941
- Grant 539, 1939 Albert V Hardy, Columbia University, \$500 Shigelli dysenteriae Hardy, A V The Mouse Mucosa Test in the Study of Shigelli, to be published
- Grant 541, 1939 Henry Laurens, Tulane University, \$350, lowering of arterial pressure by carbon arc radiation See grant 498, 1938 Laurens, Henry, and Graham, J S The Influence of the Pressure Lowering Effect of Carbon Arc Radiation, *M Rec* 154: 146, 1941
- Grant 542, 1939 Kendall B Corbin, University of Tennessee, \$200, alterations in the hip after deaeration
- Grant 552, 1939 Marion Fay, Woman's Medical College of Pennsylvania, \$250, biochemistry of strontium See grant 474, 1937
- Grant 557, 1939 W D Armstrong, University of Minnesota, \$500, calcification of bone in vitro
- Grant 559, 1939 Harold D West, Meharry Medical College, \$50, synthesis of *dl* threonine See grant 518, 1938
- Grant 560, 1939 B S Kline and H P Lankelma Western Reserve University, \$500, chemical study of antigens Wellman, J W, and Lankelma, H P Purification of the Antigen of Syphilis, *Pen Dis Inform* 22: 12, 1941
- Grant 562, 1939 Joseph H Roc, George Washington University, \$350 vitamin C requirements of man Kuecher, Carl A, and Roc, J H Determination of Ascorbic Acid in Whole Blood *Proc Soc Exper Biol & Med* 47: 467, 1941 Roc, J H, Hall, J M, and Dyer, H M Relation of Nutrition to Gastric Function II The Effect of Vitamin C Deficiency *Am J Digest Dis* 8: 261, 1941
- Grant 567, 1940 Armand J Quick, Marquette University, \$275, conversion of prothrombin to thrombin Quick, A J Prothrombin Concentration of the Blood in Various Species, *Am J Physiol* 132: 239, 1941 Prothrombin Level of Blood After Intramuscular Injection of Sodium Citrate, *Proc Soc Exper Biol & Med* 47: 1, 1941
- Grant 570, 1940 William H Sweet, University of Chicago \$300, course of nerve fiber tracts of the temporal lobe
- Grant 571, 1940 Joseph T King, University of Minnesota, \$280, autogenous effect of tissues on the action of sulfanilamide
- Grant 574, 1940 A G Eaton Louisiana State University, \$100 absorption and metabolism of amino acids Eaton A G, and Doty, J R The Heat Production and Blood and Urine Constituents After Administration of L(-) Histidine to the Dog, *J Nutrition* 21: 25, 1941

- Grant 576, 1940 Edward S West, University of Oregon Medical School \$250, solution of vesical calculi
- Grant 577, 1940 Alexander H Levy, University of Oregon Medical School, \$200, collateral circulation for coronary occlusion See grant 527, 1938
- Grant 579, 1940 Harry C Rolnick, Michael Reese Hospital, Chicago \$200, effect of trauma on the response of the kidney to sudden blockage
- Grant 582, 1940 Charles W Greene, Stanford University, \$500, physiology of the coronary system in monkeys
- Grant 583, 1940 Ulrich Friedemann, Jewish Hospital of Brooklyn, \$300, genesis of tetanus Friedemann, Ulrich; Hollander, A, and Tarlov, I M Investigations of the Pathogenesis of Tetanus III, *J Immunol* 40: 325, 1941
- Grant 584, 1940 Oscar V Batson, University of Pennsylvania \$200, nystagmus
- Grant 585, 1940 Howard Curl, University of Tennessee, \$400 roentgenologic study of the normal gallbladder
- Grant 590, 1940 David Polowe, Paterson, N J, \$150, pancreatic function test See grant 597, 1940
- Grant 591, 1940 Percival Bailey, University of Illinois \$500 effects of electrolytic lesions in the periaqueductal gray matter of the Macaca monkey
- Grant 593, 1940 A M Lissek, Medical College of the State of South Carolina, \$300, origin of the pyramidal tract in the monkey The Effect of Pre and Postcentral Cortical Ablations on the Fibers of the Pyramids in Monkeys, *J Nert & Ment Dis*, to be published
- Grant 594, 1940 I L Chaikoff, University of California \$350, phospholipid metabolism and blood regeneration as measured by radio active phosphorus
- Grant 595, 1940 Arthur C Allen, Mount Sinai Hospital, New York, \$250, effect of chemicals on vegetations of experimental endocarditis
- Grant 596, 1940 Israel Davidsohn, Mount Sinai Hospital, Chicago, \$400, bacteriogenic hemagglutination
- Grant 597, 1940 David Polowe, Paterson, N J, \$100, pancreatic function test See grant 590, 1940

3 WORK STOPPED, NO RESULT PUBLISHED

- Grant 547, 1939 Max T Schmitker, Toledo Hospital, Toledo Ohio, \$300, Berger rhythm determinations following cerebral trauma (refund, \$150) The work was stopped for the time being on account of technical difficulties
- Grant 602, 1941 Doran J Stephens, University of Rochester, \$400, changes in the thyroid gland of undernourished guinea pigs (refund, \$371.34) The grantee died on March 19 1941 See grant 575, 1940

Report of Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research

During the year 1941 the committee issued thirty new grants A detailed list of these grants, a list of publications during 1941, and a list of unexpired grants made before Jan 1, 1941 are included in this report

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research, reports of which were published during 1941.

- Optimal NaCl Concentration for Oral Saline Diuresis, Julius M Coon, R O Noojin and Carl Pfeiffer *Am J Physiol* 134: 723 (Nov.) 1941
- An Experimentally Derived Method for Determining the Degree of Infection in Avian Malaria, Harry Beckman *Am J Trop Med* 21: 151 (Jan.) 1941
- The Cause of Death in Experimental Anuria, Hebbel E Hoff, Paul K Smith and Alexander W Winkler *J Clin Investigation* 20: 607 (Nov.) 1941
- Toxicity of Potassium in Adrenalectomized Dogs, A W Winkler, H I Hoff and P K Smith *Am J Physiol* 133: 494 (June) 1941
- The Cause of Death in Experimental Anuria, H E Hoff, P K Smith and A W Winkler *Am J Physiol* 133: 331 (June) 1941
- Recovery of Fatigued Muscle following Intravenous Injection of Potassium Chloride, Hebbel E Hoff, Alexander W Winkler and Paul K Smith *Am J Physiol* 131: 615 (Jan.) 1941
- The Toxicity of Orally Administered Potassium Salts in Renal Insufficiency, A W Winkler, H E Hoff and P K Smith *J Clin Investigation* 20: 119 (March) 1941
- Lactogenic Hormone: Extraction and Assay of Lactogenic Hormone in Postpartum Urine, Joseph Meites and C W Turner *J Clin Endocrinol* 1: 918 (Nov.) 1941
- Does Pregnancy Suppress the Lactogenic Hormone of the Pituitary? C W Turner and Joseph Meites *Endocrinology* 20: 165 (Aug.) 1941
- Relation of Size of Litter to AP Lactogen Content of Nursing Rabbits, J Meites, A J Bergman and C W Turner *Proc Soc Exper Biol & Med* 46: 670, 1941
- Comparison of Assay Methods Using International Standard Lactogen, J Meites, A J Bergman and C W Turner *Endocrinology* 28: 707 (May) 1941
- The Reliability of the Cobalt Isopropylamine Color Reaction for Amniol The Evaluation of Chromogenic Substances in Urine, R I Krause and Richard F Riley *J Pharmacol & Exper Therap* 71: 287 (March) 1941

- Blood Sugar and Liver Glycogen II Recovery After Single and Repeated Doses of Sulfonamide Drugs, Roberta Hafkesbrung, Esther M Greisheimer and Grace E Wertenberger *Medical Times*, November 1941
- III Blood pH and the Sulfonamides, Grace E Wertenberger *Medical Times*, November 1941
- NaCl and Peritoneal Absorption and Renal Excretion of Glucose in Normal and Diabetic Rats, George Sayers and James M Orten *Proc Soc Exper Biol & Med* 46: 287, 1941
- The Electrocardiogram in Acute Emetine Intoxication, Linn J Boyd and David Scherf *J Pharmacol & Exper Therap* 71: 362 (April) 1941
- Factors Influencing the Conjugation of Sulfapyridine, B K Harned and V V Cole *J Biol Chem* 140: 111 (July) 1941
- The Relative Responses of the Dorsal Metacarpal Digital and Terminal Skin Arteries of the Hand in Vasoconstrictor Reflexes, Alrick B Hertzman *Am J Physiol* 134: 59 (Aug) 1941
- Use of Colchicine in Detecting Hormonal Effects on Vaginal Epithelium of Menstruating and Castrate Women Ephraim Shorr and Eugene J Cohen *Proc Soc Exper Biol & Med* 46: 330, 1941
- The Effect of Histamine on the Pulmonary Blood Pressure of Various Animals With and Without Anesthesia, R A Woodbury and W F Hamilton *J Pharmacol & Exper Therap* 71: 293 (March) 1941
- The Effect of Convulsive Doses of Metrazol on Blood Pressure As Employed Therapeutically, During Spinal Anesthesia and During Asthenia, from Curare, R A Woodbury, H M Cleckley, Perry P Volpito and W F Hamilton *Am J Physiol* 133: 498 (June) 1941
- The Effect of Metrazol on the Blood Pressure of Man and Dog, R A Woodbury, W F Hamilton, H M Cleckley and Perry P Volpito *J Pharmacol & Exper Therap* 73: 431 (Dec) 1941
- Effect of Pentothal Sodium on Urine Output Under Various Experimental Conditions Herbert Silvette *J Pharmacol & Exper Therap* 72: 37 (May) 1941
- Acquired Tolerance to Small Doses of Postprandial Extract, Herbert Silvette and C N Psimas *Am J Physiol* 133: 447 (June) 1941
- The Effect of Various Agents on Blood Coagulation Time in Dogs, J A Richardson, F C Hays and R P Walton *J Pharmacol & Exper Therap* 73: 146 (Oct) 1941
- Recovery After Sulfonamide Drugs, Roberta Hafkesbrung and Esther M Greisheimer *Am J Physiol* 133: 310 (June) 1941
- pH Changes in the Blood Following Sulfapyridine and Sulfathiazole Administration, Grace E Wertenberger *Am J Physiol* 133: 488 (June) 1941
- A Classification of the Causes of Hypoleydigism, Fuller Albright, Ann P Forbes, Russell Fraser, Bretney Miller and Edward C Reifenstein Jr *Am J Physicians* 56: 43, 1941
- A New Microrespirometer for Nerve, P W Davies and Frank Brink Jr *Am J Physiol* 133: 257 (June) 1941
- Chemical Control of Respiration and Activity in Peripheral Nerve D W Bronk, Frank Brink Jr and P W Davies *Am J Physiol* 133: 224 (June) 1941
- Chemical Initiation of Rhythmic Local Responses in Nerve Preceding Trains of Propagated Impulses Frank Brink Jr and D W Bronk *Am J Physiol* 133: 222 (June) 1941
- The Ionic Permeability (Electrical Conductance) of the Sensitized Nictitating Membrane of the Cat, Rose Marrazzi and Amedeo S Marrazzi *Am J Physiol* 133: 377 (June) 1941
- Correlation Between Structure and the Ratio of Inhibitory to Pressor Activity of Sympathomimetic Amines, Amedeo S Marrazzi *J Pharmacol & Exper Therap* 72: 28 (May) 1941
- Coronary Reflex Dilatations Accompanying Contractions of Voluntary Muscles, Charles W Greene *Am J Physiol* 132: 321 (March) 1941
- Clinical and Experimental Studies on Paraldehyde, Meyer Bodansky Julius Luther Jenkins Harry Levine and Albert Joseph Gilbert *Anesthesiology* 2: 20 (Jan) 1941
- Resistance to Slowly Increasing Doses of Sodium Pentobarbital in the White Rat Duration of Higher Tolerance After Parturition and Effects of Age, Sex, Castration and Administration of Testosterone Propionate Harald G O Holck and Donald R Mathieson *Am J Physiol* 133: 332 (June) 1941
- Mammary Growth in Hypophysectomized Male Mice Receiving Estrogen and Prolactin, W U Gardner and Abraham White *Proc Soc Exper Biol & Med* 48: 590, 1941
- The Absorption and Fate of Free Citric Acid in the Rat, Carl A Kuether and Arthur H Smith *J Biol Chem* 137: 647 (Feb) 1941
- Effects of Estrone and Progesterone on Male Rabbit Mammary Glands I Varying Doses of Progesterone, William R Lyons and Daniel A McGinty *Proc Soc Exper Biol & Med* 48: 83, 1941
- Effects of Estrone and Progesterone on Male Rabbit Mammary Glands II Varying Doses of Estrone, George Scharf and William R Lyons *Proc Soc Exper Biol & Med* 48: 83, 1941
- Mammalian and Avian Assays of Hypophyseal Lactogenic Preparations William R Lyons *Endocrinology* 28: 161 (Feb) 1941
- Tissue Hydration During Morphine Addiction and Withdrawal in Rats on Low Calcium Diet and on High Calcium Diet with Parathyroid Hormone Injections, Lawrence E Detrick and C H Thienes *Arch internat de pharmacodyn et de therap* 66: 130 (July 31) 1941
- Cardiac Output in Coronary Occlusion Studied by the Wezler Boeger Physical Method, Arthur Grishman and Arthur M Master *Proc Soc Exper Biol & Med* 48: 207, 1941
- Blood Sugar and Liver Glycogen After Single Doses of Sulfanilamide Sodium Sulfapyridine and Sodium Sulfathiazole Esther M Greisheimer Roberta Hafkesbrung and Hulda Magalhães *Medical Times* 69: 170 (April) 1941
- Quantitative Effects of Implantation of Cattle Anterior Pituitary Powder on Gonads of Immature Rat, Robert H Shuler *Proc Soc Exper Biol & Med* 46: 537, 1941
- The Clinical Pathological Correlation of Neurosyphilis, Hyman S Rubinstein *Urol & Cutan Rv* 45: 255 (April) 1941
- Bromine and the Thyroid, Emil J Baumann, David B Sprinson and David Marine *Endocrinology* 28: 793 (May) 1941
- The Effects of Nitrites and Xanthines on Coronary Inflow and Blood Pressure in Anesthetized Dogs, Norman H Boyer and Harold D Green *Am Heart J* 21: 199 (Feb) 1941
- The Effect of Sodium Nitrite on the Emptying Time of the Normal Human Stomach, Clark K Sleeth and Edward J Van Lier *Arch internat de pharmacodyn et de therap* 65: 5 (Jan) 15) 1941
- The Effect of Testosterone Propionate on the Rat Testis H S Rubinstein and A A Kurland *Endocrinology* 28: 495 (March) 1941
- Further Study of Central Stimulation from Sympathomimetic Amines, J W Schulte, E C Reif J A Bucher Jr, W S Lawrence and M I Tainter *J Pharmacol & Exper Therap* 71: 62 (Jan) 1941
- The Mechanics of Gastric Evacuation J M Werle, D A Brody, E W Ligon Jr, M R Read and J P Quigley *Am J Physiol* 131: 606 (Jan) 1941
- Ascorbic Acid and Arspenamine Dermatitis Frank M McDonald and Herbert H Johnson *Arch Dermat & Syph* 43: 682 (April) 1941
- Studies on the Inactivation of Diphtheria Toxin by Vitamin C (Ascorbic Acid) Claus W Jungeblut *J Infect Dis* 69: 70 (July Aug) 1941
- Effect of Sulfapyridine on Staphylococcus Toxin R H Rigdon, Anne Haynes and Alys Lipscomb *J Lab & Clin Med* 26: 1111 (April) 1941
- Serum Therapy of Tetanus, Ralph Spaeth *Am J Dis Child* 61: 1146 (June) 1941
- Estrin Potency and Basal Metabolism Mary E Collett Faith W Reed Lebelbe Isaac Sylvia Rouse and Eleanor Yeakel *Am J Obst Gynec* 42: 93 (July) 1941
- Acute Fatal Insulin Poisoning Eugene L Jackson *J Pharmacol & Exper Therap* 72: 21 (May) 1941
- The Effects of Benzedrine Coramine Metrazol and Picrotoxin on Body Temperature and Gaseous Metabolism in Rabbits Depressed by Alcohol Harold W Werner *J Pharmacol & Exper Therap* 72: 45 (May) 1941
- The following grants were issued before Jan 1, 1941. In some cases the grant has expired and an unexpended balance remains, or the work is not yet completed or not yet published
- Grant 164 E L Jackson associate professor of pharmacology, Emory University School of Medicine \$200, to investigate the antagonism between sodium barbital and insulin.
- Grant 221 John G Reinhold, Department of Public Health Philadelphia General Hospital, \$250, to investigate the action of aminoacetic acid (glycine) in progressive muscular dystrophy
- Grant 232 George R Cowgill, associate professor of physiologic chemistry, Yale University School of Medicine, \$250, to investigate the heart in vitamin B deficiency
- Grant 238 Roy R Kracke, professor of pathology, Emory University School of Medicine \$250, to investigate the effect of the oxidation products of aminopyrine and related drugs on the leukocyte counts of rabbits
- Grant 248 Fred C Koch chairman of the Department of Physiological Chemistry and Pharmacology, University of Chicago, \$250 to investigate the male sex hormone
- Grant 263 H A Shoemaker associate professor of biochemistry and pharmacology, C E Clymer, professor of clinical surgery and Henry H Turner, University of Oklahoma School of Medicine, \$150, to investigate the blood cholesterol and iodine value in thyroid disease and their alteration by treatment
- Grant 264 Detlev W Bronk, Johnson professor of biophysics University of Pennsylvania School of Medicine \$200, to investigate the action of various drugs on the autonomic centers
- Grant 280 John P Peters professor of medicine, Yale University School of Medicine \$200 to investigate by means of intravenous pyelography the state of ureters and kidneys in a large series of patients after delivery and subsidence of acute signs of toxemia
- Grant 297 Melvin Dresbach, Harvard University School of Medicine, \$250, to investigate the emetic effect of some of the digitalis bodies
- Grant 305 Beverly Douglas, assistant dean and associate professor of Surgery, Vanderbilt University School of Medicine, \$250, to investigate the pneumatic (transparent rubber jacket) system of treating extensive wounds
- Grant 306 Edwards A Park professor of pediatrics Johns Hopkins University School of Medicine \$75, to investigate rickets in the rat and the effect of solution of parathyroid on the circulation of the bone
- Grant 311 Clarence P Berg assistant professor of biochemistry State University of Iowa, \$250 to investigate amino acids
- Grant 314 F C Koch, chairman, Department of Physiological Chemistry and Pharmacology, University of Chicago \$250, to investigate provitamin D
- Grant 333 Owen S Gibbs, former chief of Pharmacological Division University of Tennessee College of Medicine, \$180, to investigate the toxicity of morphine and scopolamine on rats
- Grant 355 Peter A Knoefel associate professor of pharmacology University of Louisville School of Medicine, \$150 to investigate the action of the amines, of the epinephrine series and of related substances on the central nervous system
- Grant 356 John B Lugen, research associate in medicine, University of California Medical School, \$150 to investigate the potassium and sodium ions in the blood of asthmatic patients and in anxiety states
- Grant 362 James M Orten, assistant professor of physiologic chemistry Wayne University College of Medicine, \$150, to investigate the effect of copper and certain other inorganic salts on the hypoglycemic activity of insulin
- Grant 367 Simon Benson former dean of pharmacy, Ferris Institute \$100 to investigate the therapeutic effects of skin counterirritants
- Grant 370 Harald G O Holck associate professor of pharmacology University of Nebraska College of Pharmacy, \$250, to investigate the possible effect of aging on the strength of digitalis preparations

Grant 375: Joseph Seifter, Department of Pharmacology, Western Reserve University School of Medicine, \$250, to investigate the pharmacology of metal alkyls.

Grant 376: R. W. Gerard, professor of physiology, the University of Chicago, \$200, to investigate the therapeutic effect of pyocyanin in schizophrenia.

Grant 391: A. R. McIntyre, professor of physiology and pharmacology, the University of Nebraska College of Medicine, \$100, to investigate ouabain and cardiac muscle and metabolism.

Grant 392: Arthur H. Smith, chairman of the Department of Physiological Chemistry, Wayne University College of Medicine, \$200, to investigate the rate of absorption of citric acid and citrates from the intestine, and the relative significance of these compounds as precursors of liver glycogen.

Grant 393: Arnold De M. Welch, formerly of the Department of Pharmacology, Washington University School of Medicine, \$300, to investigate the lipotropic activity of choline, betaine and their derivatives.

Grant 395: R. W. Whitehead, professor of physiology and pharmacology, University of Colorado School of Medicine and Hospitals, \$150, to investigate the influence of electrolytes in anaphylaxis.

Grant 403: Erwin E. Nelson, professor of pharmacology, Tulane University School of Medicine, \$100, to investigate pituitary extracts.

Grant 404: Carl Pfeiffer, Department of Pharmacology, Wayne University College of Medicine, \$300, to investigate caffeine withdrawal headaches.

Grant 405: A. C. Ivy, Department of Physiology, Northwestern University Medical School, \$225, to investigate the effect of gastrectomy on the monkey.

Grant 406: John C. Krantz Jr., professor of pharmacology, University of Maryland, \$250, to investigate the action of the nitrites.

Grant 408: Ephraim Shorr, assistant professor of medicine, Cornell University Medical College, \$300, to investigate the effect of progesterone on the vaginal smear.

Grant 409: Reinhard Beutner, professor of pharmacology, Hahnemann Medical College and Hospital, Philadelphia, \$200, to investigate the toxicity and detoxification of local anesthetics.

Grant 411: Linn J. Boyd, professor of pharmacology, New York Medical College, \$300, to investigate the effects of hypnotics on mercurial diuretics.

Grant 412: Anne Forbes, Massachusetts General Hospital, Boston, \$400, to investigate the effect of various endocrine diseases and the administration of various endocrine products on the 17-keto-steroid secretion in the urine.

Grant 413: Claude E. Forkner, New York Hospital, Department of Medicine, \$300, to investigate bronchiectasis, etiology and treatment.

Grant 415: B. K. Harned, professor of pharmacology, and V. V. Cole, assistant professor of pharmacology, Woman's Medical College of Pennsylvania, \$300, to investigate the effects of sulfanilamide and sulapyridine on hepatic function.

Grant 416: Alrick B. Hertzman, associate professor of physiology, St. Louis University School of Medicine, \$500, to investigate peripheral circulation.

Grant 417: H. E. Hoff, assistant professor of physiology, A. W. Winkler, instructor in medicine, and P. K. Smith, research assistant in pharmacology and toxicology, Yale University School of Medicine, \$250, to investigate the action of ions.

Grant 419: Thomas H. McGavack, New York Medical College, \$300, to investigate the action of lipocae and pancreatic extracts.

Grant 420: Lester M. Morrison, Temple University Medical School and Hospital, \$300, to investigate the effect of sulfanilamide on infections of the gallbladder.

Grant 421: Herbert Silvette, assistant professor of pharmacology, University of Virginia Medical School, \$250, to investigate the effects of the antidiuretic hormone of the posterior pituitary gland.

Grant 422: Charles W. Turner, professor of dairy husbandry, University of Missouri College of Agriculture, \$500, to investigate the action of lactogenic hormone in cases of deficient lactation.

Grant 423: Trent B. Johnson, professor of organic chemistry, Yale University School of Medicine, \$250, to investigate pyrimidines.

Grant 426: J. P. Quigley, Department of Physiology, Western Reserve University School of Medicine, \$250, to investigate the mechanism of pylorospasm.

Grant 428: Milton Kissin, Beth Israel Hospital, New York, \$50, to investigate the influence of aminophylline among cardiac patients.

Grant 429: John A. Vaichulis, Loyola University School of Medicine, \$300, to investigate the separation of the pressor and oxytocic fractions from the pituitary gland.

Grant 430: J. P. Simonds, Department of Pathology, Northwestern University Medical School, \$100, to investigate the selective action of different types of poisons on the kidneys.

Grant 431: Meyer Bodansky, professor of pathologic chemistry, University of Texas School of Medicine, \$200, to investigate the metabolism and pharmacology of paraldehyde.

Grant 433: Harry Beckman, professor of pharmacology, Marquette University School of Medicine, \$250, to investigate the prophylaxis of malaria.

Grant 434: William R. Lyons, Division of Anatomy, University of California Medical School, \$200, to investigate lactogenic hormones.

During 1941 the following grants were made:

Grant 436: Richard C. de Bodo, associate professor of pharmacology, New York University College of Medicine, \$350, to investigate the antidiuretic action of the narcotics.

Grant 437: M. L. Tainter, professor of pharmacology, Stanford University School of Medicine, \$250, to investigate sympathomimetic amines.

Grant 438: George L. Maisen, assistant professor of physiology, Wayne University College of Medicine, \$200, to investigate the effect of certain drugs on the strength of skeletal muscle.

Grant 439: H. N. Cole, clinical professor of dermatology and syphilology, Western Reserve University School of Medicine, \$45.60, to investigate the effect of the administration of gold sodium thiosulfate.

Grant 440: W. E. Hambourger, assistant professor of pharmacology, Western Reserve University School of Medicine, \$100, to investigate the action of drugs on the central nervous system.

Grant 441: Harald G. O. Holck, associate professor of pharmacology, University of Nebraska College of Pharmacy, \$150, to investigate the relation of sex to drug action.

Grant 442: Morton McCutcheon, associate professor of pathology, University of Pennsylvania School of Medicine, \$150, to investigate cellular locomotion.

Grant 443: A. B. Baker, assistant professor of neuropsychiatry and neuropathology, and Raymond N. Bieter, professor of pharmacology, University of Minnesota Medical School, \$500, to investigate toxic effects of sulfanilamide and derivatives on nervous system and effect of vitamin B complex in prevention of such injuries.

Grant 445: Paul L. Day, professor of physiologic chemistry, and John R. Totter, instructor in physiologic chemistry, University of Arkansas School of Medicine, \$360, to investigate ocular manifestations of tryptophan deficiency.

Grant 446: Carl A. Dragstedt, professor of pharmacology, Northwestern University Medical School, \$100, to investigate the effect of heparin on anaphylactic and related phenomena.

Grant 447: W. F. Hamilton, professor of pharmacology and physiology, University of Georgia School of Medicine, \$125, to investigate blood pressure responses in normal and anesthetized animals.

Grant 448: Victor G. Haury, associate professor of pharmacology, Jefferson Medical College of Philadelphia, \$250, to investigate the pharmacologic and physiologic behavior of magnesium, calcium and potassium.

Grant 449: Alrick B. Hertzman, professor of physiology, St. Louis University School of Medicine, \$500, to investigate peripheral circulation.

Grant 450: Linn J. Boyd, professor of pharmacology, and David Scherf, associate clinical professor of medicine, New York Medical College, \$50, to investigate the effect of strophanthin in paroxysmal tachycardia.

Grant 451: W. J. MacNeal, director of the Laboratories of Bacteriology, New York Post-Graduate Medical School and Hospital, \$400, to investigate therapy of experimental viridans endocarditis.

Grant 452: W. J. MacNeal, director of the Laboratories of Bacteriology, New York Post-Graduate Medical School and Hospital, \$250, to investigate the bacteriophage phenomenon and therapeutic application of bacteriophages.

Grant 453: Amedeo S. Narrazzi, assistant professor of pharmacology, New York University College of Medicine, \$500, to investigate sympathomimetic amines.

Grant 454: W. L. Mendenhall, professor of pharmacology, and Albert J. Plummer, assistant professor of pharmacology, Boston University School of Medicine, \$50, to investigate the quantitative determination of theophylline.

Grant 455: Frederick H. Pratt, professor of physiology, and Marion A. Reid, instructor in physiology, Boston University School of Medicine, \$100, to investigate the effect of cardiac drugs on the denervated lymphatic hearts.

Grant 456: H. Morow Sweeney, professor of physiology and pharmacology, University of South Dakota, \$100, to investigate the effects and mode of action of certain drugs with analeptic properties, namely amphetamine and metrazol, after morphine and sodium pentobarbital respectively.

Grant 457: Leland C. Wyman, associate professor of physiology, Boston University School of Medicine, \$372.50, to investigate the factors controlling the growth and functional efficiency of transplanted adrenal cortical tissue.

Grant 458: George Fahr, professor of internal medicine, University of Minnesota Medical School, \$100, to investigate the effects of lanatoside C on certain types of heart disease.

Grant 459: Mary E. O'Sullivan, Bellevue Hospital, \$100, to investigate the therapeutic effect of estradiol in muscular dystrophy.

Grant 460: Esther M. Greisheimer, professor of physiology, Woman's Medical College of Pennsylvania, \$150, to investigate the effects of sulfanilamide and related compounds on blood sugar and liver glycogen.

Grant 461: Roberta Hafkesbrink, associate professor of physiology, Woman's Medical College of Pennsylvania, \$250, to investigate electrocardiographic changes during the administration of sulfonamide drugs.

Grant 462: B. K. Harned, professor of pharmacology, Versa V. Cole, associate professor of pharmacology, and Hughbert C. Hamilton, associate professor of physiology, Woman's Medical College of Pennsylvania, \$288, to investigate the effects of bromide administered to pregnant rats on the learning ability of the offspring.

Grant 463: Abraham White, assistant professor of physiologic chemistry, Yale University School of Medicine, \$200, to investigate the hormones of the anterior pituitary gland.

Grant 464: A. J. Nedzel, associate professor of pathology, University of Illinois College of Medicine, \$300, to investigate response of the animal body to drugs under different environmental conditions.

Grant 465: L. N. Katz, director of cardiovascular research, Michael Reese Hospital, \$200, to investigate the action of various steroids on capillary permeability.

Grant 466: R. H. Rigdon, associate professor of pathology, University of Tennessee, \$100, to prepare a movie of a clinical case of malaria with the pathologic changes.

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association
for the Year Ended December 31, 1941

Funds on Deposit as at December 31, 1941 . . .	<u>\$ 7,519 76</u>

HERMAN L. KRETSCHMER, Treasurer

AUDITOR'S REPORT

January 31, 1942

To the Board of Trustees,
American Medical Association, Chicago, Illinois.

Dear Sirs:

We have examined the Balance Sheet of the American Medical Association, Chicago, Illinois, as of December 31, 1941, and the statement of Income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and, without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated regarding confirmation of receivables and observation of the inventory taking.

The cash and bank balances have been confirmed by count or by certificates from the depositaries. The U. S. Government and other marketable securities were inspected; also, an acknowledgment as to custody of the securities for safekeeping was received from the Continental Illinois National Bank and Trust Company of Chicago.

We did not independently confirm the accounts receivable by communication with the debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable. We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded.

Expenditures charged to property and equipment accounts during the year, in our opinion, were properly capitalized as representing additions or improvements. The provision for depreciation for the year appears to be adequate.

In our opinion, subject to the exceptions set forth in paragraph three, the accompanying Balance Sheet and related statement of Income present fairly the position of the American Medical Association at December 31, 1941, and the results of the operations for the year, based on the accounting procedures employed by the Association regarding which the following observations are submitted:

(a) In accordance with the established practice of the Association, the accounts as stated do not include (a) unrecorded assets in respect of accrued interest on bond investments, and membership dues unpaid; and (b) provision for accrued property taxes for the year 1940, and sundry unpaid bills and wages.

(b) Subscriptions paid in advance are stated at an estimated amount which is based on cash received in December 1941, on account of 1942 subscriptions. This procedure conforms to the method used in prior years.

(c) Advance payments on publications include an estimated amount (\$137,077.28) for prepaid subscriptions to HYGIEA and the amount (\$41,813.79) received in advance for January 1942 advertising, directory information sales and service.

(d) As of January 1, 1941, the land and buildings accounts were restated on the basis of cost, and the complementary credit

in respect to unrealized appreciation applicable thereto was eliminated from the net worth of the Association.

We have received a letter from Messrs. Loesch, Scofield, Loesch and Burke, attorneys for the Association, regarding litigation pending against the Association or its officers at December 31, 1941, which states that the following lawsuits had been filed:

Jean Paul Fernel—\$1,000,000 00 (libel)
William E. Balsinger—\$100,000.00 (libel)
Muriel Longini—\$1,000 00 (claim)
United States of America (conspiracy in restraint of trade)

The attorneys state that in their opinion all of these suits will be defeated.

Fidelity insurance is carried against the undermentioned officers and employees, in the amounts stated:

Dr. Olin West, Secretary and General Manager.....	\$10,000 00
Dr. Herman L. Kretschmer, Treasurer.....	10,000 00
E. A. Hoffman, Cashier.....	10,000 00
J. E. Hartigan, Assistant Cashier.....	2,000 00
Sundry Employees (thirteen, \$1,000 00 each) . . .	13,000 00
	<u>Total Fidelity Insurance</u>
	\$45,000 00

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for the proper conduct of the examination.

Yours truly,

PEAT, MARWICK, MITCHELL & Co

REPORT OF THE COUNCIL ON MEDICAL
EDUCATION AND HOSPITALS*To the Members of the House of Delegates of the American Medical Association:*

1. It is with great regret and with a sense of extreme loss to the Association and to the cause of medical education and scientific medicine that the Council records the death of Dr. William D. Cutter, who had served as Secretary of the Council on Medical Education and Hospitals since 1931. Dr. Cutter died after a brief illness on Jan. 22, 1942. It is the desire of the Council that the following resolution be included in the Proceedings of this annual session:

In the demise of William D. Cutter, M.D., the Council on Medical Education and Hospitals lost a valuable secretary and organized medicine a true friend.

Dr. Cutter's services to scientific teaching, his lifetime devotion to medical education, his unwavering faith in the destiny of American medicine and his career as a medical educator made a splendid contribution to the work of the Council.

His character and ideals happily combined with high ethical values will long be remembered and cherished.

The members of the Council desire to record their appreciation and gratitude for his splendid services and to express their great personal loss in his death.

2. Dr. Herman G. Weiskotten, Syracuse, N. Y., a member of the Council since 1940, assumed the responsibilities of the secretary on March 4, 1942.

3. After a number of conferences, in many of which the Council participated, the U. S. Army and the U. S. Navy early last summer authorized the granting of commissions to junior and senior medical students as second lieutenants in the Medical Administrative Corps Reserve, U. S. Army, or Ensign H V (P), U. S. Navy, with the understanding that they will not be called to active duty until they have completed one year of internship, the choice as to Army or Navy being voluntary. After graduation they are eligible for appointment as first lieutenant, Medical Corps, Army of the United States or Ensign H V (P), U. S. Navy Reserve. The War Department and the Navy Department recently authorized the granting of commissions also to freshmen and sophomore medical students and to students who are bona fide matriculants in approved medical schools. Selective Service has provided for the deferment of all medical students in good standing who fail to meet the physical require-

ments for such commissions in the Army or Navy. Thus there seems to be assurance of a continuing supply of physicians at least for the next three years as future medical officers and for the care of the civilian population. We cannot be sure that the protection now offered premedical students is such as to assure an adequate number of well prepared medical students to meet future needs.

This program, however, does not provide for the training of young physicians beyond the period of a one year internship. Believing that the further education of a certain number of physicians is vital to the future of the country, a committee of the Council and the Advisory Board for Medical Specialties has been appointed, the chief purpose of which will be to work out plans for preserving a percentage of recent graduates for training in the specialties.

4. With regard to the program for speeding up the production of physicians to meet the war needs by accelerating the medical curriculum, the Council is of the opinion that:

The adoption of a program for an accelerated curriculum for approved medical schools during this war period is a decision which should be determined by each medical school.

The decision of a medical school to initiate an accelerated curriculum should be made only after a comprehensive survey of the personnel, facilities and equipment of the school and its ability to give a medical education without deterioration of the quality of the medical instruction and in conformity with the statutes of the various states and the rulings of the state medical boards.

The Council stands ready to make necessary inspections whenever in its judgment such inspections are required to maintain the present high standards of medical education.

The Council believes that financial assistance for needy medical students during the accelerated program is best provided through scholarships or loans.

Similar resolutions have been adopted by the Association of American Medical Colleges and the Federation of State Medical Boards of the United States. In fact, a liaison committee of the Council and the Association of American Medical Colleges has been appointed to confer on this and other problems of mutual interest.

Many of the medical schools have announced that they are planning to adopt an accelerated curriculum. Various plans of acceleration have been adopted, practically all of which involve the elimination of the long summer vacation and the completion of the medical course in approximately three calendar years. Some of the schools plan to admit a new class every nine months, and others will continue to admit only one class annually.

Seven schools have already advanced their senior year, and one hundred and twenty-eight students were graduated in February or March of this year by three of these schools.

Every precaution possible is being taken by the Council to preserve the present high standards of medical education in connection with this acceleration of the medical curriculum.

5. As of March 1, 1942 sixty-five four year medical schools in the United States are approved, one of which is on probation. Recognition of one school was recently withdrawn; this action being taken without prejudice to the students enrolled as of Sept. 1, 1942. In Canada there are nine approved medical schools. In the United States ten schools of the basic medical sciences are included in the approved list, two of them on probation. In Canada there is one approved school of the basic medical sciences. There is also in the United States one school offering only clinical courses which is approved. This school will cease to function with the graduating class of 1942.

Three medical schools were visited during the year, and special reports of progress were received from at least a dozen others.

In cooperation with the Office of Procurement and Assignment, the faculties of medical schools have been classified with respect to availability for medical service in national defense. Affiliated hospital units have also been established, and some of these are in active service. The importance of not permitting any faculty member considered necessary for the operation of a medical school to serve as a member of an affiliated unit has been stressed.

6. The Council's study of continuation courses for practicing physicians is being continued by correspondence and question-

naire. The results are published annually in the Educational Number. In addition there were published in THE JOURNAL in October 1941 and in January and April 1942 opportunities currently available for such study.

7. The members of the Council, the secretary and staff have attended and actively participated in numerous conferences and meetings in medical, educational, hospital, nursing and allied fields, including the Clinical Congress of the American College of Surgeons, the American Hospital Association, National League of Nursing Education, American Dental Association, the American Council on Education and the revision of the Manual of the Essentials of Good Hospital Nursing Service.

8. The theme of the Annual Congress on Medical Education and Licensure was medical education in a war emergency and also the care of the civilian population. The program included addresses by the surgeon generals, or their representative, of the Army, Navy, Public Health Service and the director of Selective Service. Over five hundred medical educators attended and received first hand information on these vital issues.

9. The problem presented by the scarcity of interns and residents is being carefully studied by the Council with a view to preserving the educational aspects of hospital training programs even though the hospital staffs are being depleted by inductions into the nation's armed forces. Hospitals are being advised to conserve the doctors' time for the purely professional work in the hospitals and to delegate the technical work to nonprofessional attendants wherever possible.

10. The Committee on American Health Resorts of the American Medical Association has requested the Council to cause its field inspectors to make inspections of health resorts. The Council has agreed to visit and inspect several spas to ascertain the advisability of assuming responsibility for such a program.

Furthermore, it is understood that a request is to be presented to the House of Delegates at this session for the inspection and approval of schools for the training of medical record librarians.

It was the sentiment of the Council that, if it is to take on these new duties, such inspections and approvals should be in consonance with the usual procedures of the Council.

11. All existing specialty boards, fifteen in number, are currently approved by the Council, as well as subdivisions of the specialties of internal medicine and surgery recognized by the boards in internal medicine and surgery. By agreement with the several boards, concurrent approval of residencies, fellowships and other opportunities for graduate study in the specialties has been established and is apparently operating to the satisfaction of all concerned.

12. The Council has now in process of compilation a volume to constitute part II of the Council's study of graduate medical education, which will deal with institutional apprenticeships, namely internships, residencies and fellowships. Part I, which was completed in 1940, covered a field study of continuation courses for practicing physicians.

13. A thorough revision of the "Essentials of an Approved Internship" is presented herewith for ratification (see appendix to Report).

14. A summary of the work of the hospital division of the Council for the fiscal year March 1, 1941 to March 1, 1942, including hospital registration, hospitals approved for intern training, for residencies and fellowships in the specialties, as well as the status of technical schools under the supervision of the Council, follows:

14. During 1941 a complete survey was made of the biographic records of approximately seven thousand physicians practicing medicine in the United States on the basis of medical studies abroad. For a period of twelve years beginning in 1926 the credentials of these physicians were verified by official correspondence with the medical schools abroad, either directly or through the diplomatic services. When it became impossible to continue this system of verification, state medical licensing boards were cautioned to scrutinize carefully all such credentials and to evaluate them with deliberation. The policy was introduced, to become effective with the American Medical Directory in 1942, to exclude from publication those graduates whose credentials obtained abroad have not been officially verified and who do not hold licenses to practice in the United States. The key symbol used in the Directory to denote the medical school and year of graduation, as, for example, Eng 7/'07, will be followed by a ° (Eng. 7, '07°) indicating that the credential has not been officially verified by the American Medical Association but is the M.D. degree or equivalent certificate accepted by the licensing board as meeting the educational requirements for licensure.

15. Major publications during 1941 and up to the time of the preparation of this report compiled by the Council and widely distributed included:

Hospital Service in the United States, containing the register of acceptable hospitals and indicating hospitals approved for internships, residencies and fellowships.

State Board Licensure Statistics, a compilation based on the records of state licensing boards and specialty examining boards.

Medical Education in the United States and Canada, including a list of medical schools currently approved and statistical compilations regarding undergraduate and graduate medical education.

Proceedings of the Annual Congress of Medical Education and Licensure.

Choice of a Medical School.

Approved Colleges of Arts and Sciences, a compilation based on lists of institutions approved by national and regional agencies acceptable to the Council.

Schools Approved for Training Clinical Laboratory, Physical Therapy and Occupational Therapy Technicians.

16. Because of the added responsibilities placed on the Bureau of Medical Economics and the Council by the national emergency, no report is available concerning the resolution adopted by the House of Delegates in 1938 requesting the Bureau of Medical Economics and the Council to undertake a study of the practice in hospitals of pathology, radiology, anesthesia and physical therapy.

17. The Twenty-First Annual Census of Hospitals covered the year 1941 and was reported in the Hospital Number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, March 28, 1942.

The census covers 6,358 registered hospitals with a total capacity of 1,324,381 beds. The increase in number of beds yearly has been uniformly in the neighborhood of 30,000, but the present annual census showed a net increase over the previous year of 98,136 beds. This increase alone is the equivalent of one 269 bed hospital for each day in the year, Sundays and holidays included.

The number of patients admitted during the year was 11,596,188, of whom 10,646,947 were to general hospitals alone.

Births in hospitals number 1,404,940. The rate of increase in hospital births was double that of the previous year.

This latest census of hospitals produced some valuable data which were obtained this year for the first time. Included in these is the number of technical personnel employed in all hospitals. There are, for example, 9,609 full time laboratory technicians and 5,534 full time x-ray technicians. The report includes also dietitians, physical therapists, pharmacists, medical record librarians, other librarians, medical stenographers, occupational therapists, dental hygienists and social service workers.

Other new items covered in this survey were

Number of patients operated on, 5,201,650, or 44.9 per cent of all patients admitted.

Number of deaths in all hospitals, 510,158, or 4.4 per cent of the patients admitted.

Necropsies, 125,640, or 24.6 per cent of the total deaths.

The response to the Twenty-First Annual Census of Hospitals was unusually good, there being only 41 hospitals in a total of 6,358 from which no response was obtained.

18. Finally, the Council desires to emphasize again that great caution should be exercised by medical educators and hospital administrators that there be no lowering of the standards of medical education and hospitals in our efforts to assist the federal and state officials to maintain adequate medical care for the military forces and the civilian population.

Respectfully submitted

COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

RAY LAMAN WILBUR, Chairman
REGINALD FITZ

APPENDIX TO REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

ESSENTIALS OF AN APPROVED INTERNSHIP

I. INTRODUCTION

1. The primary function of a hospital is to provide facilities where the sick and injured may be given scientific medical care.

2. The operation of a well organized, effective program for the training of interns enhances the quality of care rendered to the sick and in no wise conflicts with the chief purpose for which the hospital is maintained.

3. An important purpose of the internship is to supplement the undergraduate medical course by a well rounded experience of closely supervised clinical practice in diagnosis and therapy.

4. Hospitals which are approved for the training of interns accept a serious responsibility to their interns and to the communities in which they may later practice.

5. The internship is one of the most important phases of medical education. Internships designed without a well supervised educational program, or arranged merely to provide hospitals with resident personnel to relieve visiting physicians of tasks which they do not wish to perform, cannot be approved.

II. THE INTERNSHIP

1. *Basis of the Internship*—The internship is a form of apprenticeship. The intern assists in the care of patients and

receives in return instruction from the hospital staff in the clinical and laboratory aspects of his profession.

2. *Length of Internship.*—An internship should be of not less than twelve months' duration. Longer periods of service are desirable because they permit a more satisfactory educational program and allow the intern sufficient time in which to be trained adequately to assume increasing responsibility in various fields of medicine.

3. *Types of Internship.*—The Council approves "rotating," "mixed" and "straight" internships.

A "rotating" internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis.

A "mixed" internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named.

A "straight" internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology.

In rotating and mixed internships of a year's duration the time allotted to internal medicine should equal or exceed the time given to any other service. Not more than six months' time in a year's rotating or mixed internship should be devoted to any one branch of the service, including its related specialties. Too frequent a rotation of assignments in such internships is undesirable. Arrangements should be made so that each intern shall devote at least two consecutive months respectively to internal medicine and to surgery.

III. HOSPITALS ELIGIBLE FOR APPROVED INTERNSHIPS

The experience of the Council indicates that the requirements for an approved internship can be met only in a general hospital registered by the American Medical Association, admitting at least 2,500 patients or more per year, having an average daily census of at least 85 patients, exclusive of the newborn and providing a sufficient number and variety of patients in the several branches of medicine in which it undertakes to train interns. For the purpose of this section, patients who are not available to the interns for clinical study are not included.

IV. THE HOSPITAL STAFF

1. *The Staff.*—The staff, both visiting and intern, should be composed of physicians who are graduates of medical schools acceptable to the Council. The visiting staff should be composed of physicians (a) who are of unquestioned professional and moral integrity, (b) who are proficient in the fields of practice to which they devote themselves, (c) who give personal attention to the patients under their charge and (d) who pledge themselves, both individually and as a group, to provide ample instruction to the intern staff and to cooperate in their work.

V. CLINICAL RECORDS

1. *Histories.*—Adequate records should be maintained. The attending physician or surgeon should be directly responsible for the accuracy and completeness of clinical records concerning all patients under his care.

2. *Endorsement of Records.*—All case records should show by signature the names of the persons who have written them or their individual parts. Orders for treatment or for special diagnostic studies and progress notes should be signed by the person who writes them. Case histories and physical examinations completed by interns should give evidence of having been verified by the attending physician.

3. *Filing and Indexing Records.*—A competent medical record librarian should be in charge of the filing and indexing of records. To be of educational value, all case records should be readily available for special study or for reference work. When a patient is readmitted to the hospital, all previous records of his case should be obtainable without undue loss of time. Besides the usual indexes of patients by name and number, there should be an index arranged according to primary and secondary diagnoses; all surgical procedures should be listed, and the names of physicians who refer patients to the hospital should

also be recorded. Statistics concerning the hospital's clinical work should be compiled monthly and should be available at all times to the medical staff. An analysis of these figures should be included in the annual report and should be classified by departments, i. e. internal medicine, surgery, obstetrics, pediatrics (excluding the newborn), gynecology, ophthalmology, otolaryngology and so on, presenting for each department at least the following data concerning private and ward services:

Number of patients admitted or discharged.
Number of hospital days of care or average daily census.
Deaths and necropsies.
Surgical procedures.

VI. LABORATORIES

1. *Equipment.*—There should be clinical and pathologic laboratories in the hospital, under competent direction. The laboratory or laboratories should be equipped and staffed to perform ordinary routine tests, including bacteriologic, serologic, chemical, basal metabolic and tissue examination.

2. *The Pathologist.*—The pathologist should hold the degree of doctor of medicine from an approved medical school and should have qualifications in pathology acceptable to the Council. He should give to the hospital sufficient time to enable him (a) to supervise adequately the work done in the main pathologic laboratory of the hospital and in its branch laboratories if any, (b) to examine or supervise the examination of all tissues removed in surgical operations and to furnish reports of their gross and microscopic findings, (c) to perform or supervise the performance of all necropsies conducted in the hospital and render a full report of the findings, (d) to assist in the teaching of interns, (e) to be available for consultation with members of the attending and intern staff meetings and conduct or participate in clinical-pathologic and departmental conferences.

3. *Necropsies.*—The hospital should provide proper facilities for the conduct of postmortem examinations in the presence of interns and staff. The necropsy rate has come to be recognized as an index of the scientific interest of the medical staff, and well performed postmortem examinations enable progressive physicians to improve their clinical ability. No hospital will be approved for intern training which does not maintain each year a record of necropsies performed in at least 15 per cent of its deaths exclusive of stillbirths and cases released to legal authorities. Beginning with the calendar year 1943, a minimum of thirty-six necropsies a year will also be required.

4. *Records.*—A copy of each examination performed in the laboratory of pathology should be retained in the department in addition to the copy filed on the patient's clinical record. All these examination reports should be indexed by name, number and diagnosis. Slides for microscopic study of specimens removed at operation or by necropsy should also be filed in the laboratory.

VII. RADIOLOGY

1. *Equipment.*—This department should be equipped at least with suitable protected apparatus for roentgenographic and fluoroscopic procedures. The rooms provided for fluoroscopy and for viewing roentgenograms should be large enough to accommodate comfortably both interns and attending physicians during the examination of patients or interpretation of films.

2. *The Radiologist.*—The radiologist should hold the degree of doctor of medicine from an approved medical school and should have qualifications in radiology acceptable to the Council. He should give to the hospital sufficient time to supervise adequately the technical work of the department, to perform or supervise fluoroscopic examinations, to interpret films, to consult with staff physicians, and to instruct the interns. He should also attend staff meetings and the meetings of his department.

3. *Records.*—A copy of each examination report should be kept in the department in addition to the one filed in the patient's record. These reports and their original films should be filed and indexed by name, number and diagnosis.

VIII. MEDICAL LIBRARY

There should be a medical library, in charge of a competent librarian, located where it is readily accessible to the interns and staff and containing a useful collection of recent editions of standard text and reference books and current files of not less than ten of the representative medical journals. Interns should be encouraged to use the library in connection with their clinical work and may properly be asked to report on current

medical opinion concerning any special case at the bedside or to review current literature on any selected topic more formally at staff conferences or at journal club meetings that may be organized for the purpose of stimulating an interest in reading.

IX. ORGANIZATION FOR INTERN TRAINING

1. The staff should be organized into departments or sections representing such specialties as internal medicine, surgery, pediatrics, obstetrics, pathology and radiology, in order to administer the professional services of the hospital and to supervise the program of intern training to best advantage. Overdepartmentalization should be avoided, although in large hospitals departmentalization may extend to include such other specialties as ophthalmology, otolaryngology, orthopedic surgery, urology, neurology and psychiatry. Each department or section should have a chairman or department head to serve for at least a year. He should be well qualified for this position by experience in his special field, should be responsible for the general conduct of the clinical work in his department and should help to formulate and execute the intern training plan to be carried out in his department. Frequent rotation of attending physicians in charge of the various services should be avoided. Assignments should be made so that the intern has opportunity each day to meet his attending physician for the conduct of systematic ward rounds or clinics and for the study of the patients under his care. In hospitals where the management of private patients is part of the intern's responsibility, no intern should be called on to assist at any one time an unreasonable number of attending or visiting physicians.

2. *Conferences.*—The staff, either as a whole or by departments, should conduct periodically and at least once a month, staff or departmental meetings in which the work of the various clinical or laboratory services is thoroughly analyzed. Interns should be expected to attend and to take an active part in these meetings. Each month there should be one or more clinical-pathologic conferences. In addition, there should be such departmental conferences as the current activities of the various departments may require. These conferences should be educational in nature and more than a perfunctory demonstration of interesting material. As has been suggested, the intern also should be encouraged to read medical literature in connection with his clinical work and may properly be asked to report formally on current medical opinion concerning any special case.

3. *Intern Committee.*—There should be a committee of the staff, chosen from the chairmen of the several departments in the hospital, charged with the duty of organizing, supervising and evaluating the plan of intern instruction. The teaching obligations of individual staff members cannot be delegated to this committee but should be supervised by it.

X. NATURE OF THE INTERN'S DUTIES

Each intern on duty in any clinical department should write or dictate the history, physical examination and his own diagnostic impression of all patients assigned to him. He should have laboratory work assigned to him of such nature as to give him familiarity with clinical laboratory methods and to develop in him competence in the use of all those which the average physician may be called on to perform. The nonoperative treatment of each patient should, in the main, be his responsibility under critical guidance by the visiting physician.

The intern's record should be checked within twenty-four hours by a competent supervising physician, calling attention to errors in observation and adding supplementary notes containing any relevant data which the intern may have omitted. If the intern's record is acceptable, the attending physician should countersign and thus approve it. The intern should enter notes of progress on the record, describing the patient's clinical course from time to time and make sure that all treatments or special diagnostic studies are correctly recorded. When a patient is discharged, the intern should write a concluding note which describes the final diagnosis and the patient's condition as he leaves the hospital. This should be countersigned by the attending physician.

XI. TEACHING PROGRAM

1. *Bedside Teaching.*—The most important phase of intern instruction consists in well conducted teaching at the bedside. By this is meant systematic instruction of the intern by the

attending physician with an ample discussion of the history, the clinical and laboratory findings, the diagnosis and the treatment of each patient. To conduct such teaching properly is the duty of the attending physician in direct charge of the patients assigned to the intern. It cannot be delegated to others, though it may be supplemented by supervision of the intern's work by junior staff members or resident physicians. Duties which have no educational value should be avoided as far as possible.

2. *Assignment of Cases.*—The teaching program should provide ample time for the intern to study and give thorough care to all patients assigned to him. An excessive number of patients is not conducive to careful work; indeed, undue pressure of routine tasks in a hospital may lead an intern to form habits which are undesirable and even harmful. For each intern assigned to a major service, such as internal medicine, surgery, obstetrics or certain specialties, such as neurology, an admission rate averaging not more than two patients a day is desirable.

3. *Internal Medicine.*—This department should afford each intern an adequate amount of instruction and experience in general medicine and in such special medical technics as transfusion, intravenous and other parenteral therapy, and paracentesis. Preferably there should be facilities for the study of patients with tuberculosis, and with contagious, nervous and mental diseases. Each intern should receive careful instruction in modern diet therapy with technical assistance from trained dietitians. The social aspects of medicine should also receive proper emphasis.

4. *Surgery.*—Surgical training should be planned to emphasize diagnosis and preoperative and postoperative treatment of surgical cases rather than skill in operative technic. Thus the intern's work in surgery should be rather that of an assistant than of an operator. The dressing of surgical wounds should be regarded as an important part of his experience, thus giving him a particularly valuable opportunity to observe carefully the immediate effects of surgical procedures and their treatment. He should obtain instruction and experience in administration of various types of anesthetics under the supervision of a trained anesthetist.

5. *Obstetrics.*—The intern should obtain training and experience by delivering under supervision at least 10 patients. At other deliveries he should act as an assistant, not merely as an anesthetist.

6. *Pathology.*—The intern should receive experience in clinical laboratory work to perfect his skill in routine laboratory procedures. He should also receive instruction from the pathologist in the procedures of pathologic diagnosis. He should attend and, when possible, assist at necropsies, receiving instruction in technic and in pathologic interpretation. He should be required to be familiar with the pathologic studies of surgical specimens and necropsy material which concern his own patients. No other assignment should be permitted to interfere with his attendance at the postmortem examination of any case which has been under his care. Whenever possible, he should assist in the preparation and presentation of the clinical-pathologic conference when cases assigned to him are being reviewed.

7. *Outpatient Department.*—It is desirable that each intern should have supervised experience in outpatient work under circumstances comparable to the office practice of medicine. Outpatient clinics to which interns are assigned should be operated in close affiliation with corresponding services in the hospital, thus encouraging careful follow-up work and observation of patients over a long period of time.

XII. MISCELLANEOUS

1. *Record of Interns' Work.*—Certain state medical examining boards, medical schools and other agencies may desire detailed information regarding the interns' training, and therefore it is suggested that hospitals keep a record of each intern's work. Such information may be supplied to the superintendent or record office by the intern himself on special forms where space is provided for data such as the period of time covered, the service, the number of patients admitted on service, the number of histories and physical examinations completed by the intern, the number of anesthetics given by him, the number of operations performed by him and the number in which he

has assisted, the number of deliveries conducted by him and the number in which he has assisted, the number of necropsies attended, the hours spent in the laboratory, and the number of lectures, clinics and conferences attended.

2. *Rules Regarding Interns.*—The hospital should supply each intern with written or printed rules defining his duties and privileges.

3. *Interns' Living Quarters.*—The hospital should provide for the intern comfortable living quarters, healthful food and suitable recreational opportunities.

4. *Interns' Health.*—The hospital should be responsible for the interns' health, at least to the extent of providing at the beginning of each intern's service a careful physical examination, including a roentgenogram of the chest and immunization against communicable diseases. There should be at all times a readily accessible consultation service for interns with some member of the staff definitely assigned to this work. Periodic x-ray examination of each intern's chest at six month intervals during his term of service is desirable.

5. *Relationship Between Hospital and Intern.*—To avoid misunderstanding, it is desirable that each intern at the time of his appointment should enter into a formal agreement with the hospital defining mutual obligations. Such agreement should be honorably fulfilled by both parties. The breaking of it by either a hospital or an intern is not condoned by the Council. Whenever complaint is made of a breach of agreement it is the policy of the Council to ask each of the parties to submit an explanatory statement. Such statements become a part of the physician's and the hospital's record.

XIII. ADMISSION TO THE APPROVED LIST

1. *Application for Approval.*—Hospitals that desire to be accredited for intern training should apply to the Council on Medical Education and Hospitals of the American Medical Association, 535 North Dearborn Street, Chicago. For this purpose forms in duplicate will be supplied on request. They should be filled out with care by the superintendent or by some member of the staff who is familiar with the hospital's intern program, and one copy should be returned to the Council.

2. Approval for the training of interns is granted for the current year only and is subject to renewal annually. When conditions warrant it, approval may be withdrawn at any time.

REPORT OF THE COUNCIL ON SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association:

Regular meetings of the Council on Scientific Assembly were held during the week of the annual session of the Association in Cleveland in June 1941 and in Chicago on Oct. 31, 1941.

SESSIONS FOR GENERAL PRACTITIONERS

In accordance with the terms of the report of the Reference Committee on Sections and Section Work with respect to a resolution requesting the creation of a Section on General Practice, which was presented to the House of Delegates at the Cleveland session, two Sessions on General Practice in the Section on Miscellaneous Topics will be held at the Atlantic City session. The Council on Scientific Assembly appointed Dr. Lucien Stark of Norfolk, Neb., to serve as chairman and Dr. Wingate M. Johnson of Winston-Salem, N. C., as secretary to arrange a program for the sessions for general practitioners at Atlantic City.

SESSION ON LEGAL MEDICINE

One session in the Section on Miscellaneous Topics will be devoted to a program on legal medicine. The Council appointed Dr. William C. Woodward of Washington, D. C., to serve as chairman and Dr. Alan R. Moritz of Boston as secretary for this session. A program will be presented during the current meeting of the Association.

THE PAN AMERICAN FEATURE OF THE ATLANTIC CITY SESSION

The Council on Scientific Assembly submitted a recommendation to the House of Delegates at the Cleveland session in 1941 to the effect that the Atlantic City session in 1942 be in the

nature of a Pan American session, and this recommendation was approved by the House of Delegates. It was the hope of the Council and of all concerned that it would be possible to have present at the Atlantic City session a large number of the physicians of South and Central America, Mexico and Canada, but, greatly to the regret of the Council and of the officers and members of the American Medical Association, conditions created by the war have made it impossible to carry out the original plans. However, several distinguished physicians from southern countries and from Mexico and Canada have accepted invitations to participate in the scientific work of the Association as presented through the General Scientific Meetings and the meetings of the sections of the Scientific Assembly.

Unless emergencies created by the war interfere, a number of physicians from the Latin American countries and from Canada will contribute to the scientific program to be presented during the Atlantic City session.

It is the very earnest desire of the American Medical Association that cordial and lasting professional relations be established and maintained between the physicians of the United States and those of all the nations of the Western Hemisphere, and, although it has not been possible to carry out fully the proposed plans for the current annual session, it is the hope of the Council on Scientific Assembly that when the war is over it will be possible to arrange for an Inter-American session at which the American Medical Association will be honored by the presence of many of the members of scientific medical organizations of all the countries in North and South America.

The Council desires to express its most grateful appreciation to Dr. Hugh S. Cumming, Dr. Wilbur A. Sawyer and Dr. Howard R. Hartman, members of the Advisory Committee on Pan American Session, for their helpful service in connection with the efforts that were made to carry out the Pan American program proposed for the Atlantic City session.

DETERMINATION OF SERUM SENSITIVITY

At the Cleveland session in 1941 Dr. Walter W. Mott of New York submitted a resolution providing for the appointment of a committee to study the determination of serum sensitivity. This resolution was referred to the Council on Scientific Assembly in accordance with the recommendations offered by the Reference Committee on Miscellaneous Business and was given careful consideration by the Council at its meeting in October.

It was unanimously agreed by the members of the Council on Scientific Assembly that the question of determination of serum sensitivity does not appear to have been sufficiently elaborated from a scientific point of view to warrant a recommendation at this time.

THE SCIENTIFIC PROGRAM

The official program of the Atlantic City session is submitted as a part of the report of the Council on Scientific Assembly.

Within the last few years the officers of the sections of the Scientific Assembly and the Council have persisted in an effort to make the scientific programs more generally interesting and helpful and have encouraged joint section meetings, symposiums and panel discussions. It will be noted through reference to the official program that, because these innovations seem to have met with general approval, several sections have arranged for joint meetings and panel discussions this year.

The Council desires to commend the officers of the sections of the Scientific Assembly for their earnest and efficient service and to express its grateful appreciation to these officers and to thank all those who will appear as contributors to the program to be presented at the 1942 session of the Association.

Respectfully submitted.

JAMES E. PAULLIN, Chairman

CLYDE L. CUNNINGHAM

MEDICAL LEGISLATION

STATE MEDICAL LEGISLATION

Arizona

Bill Passed.—S. 14-X has passed the senate, to amend the osteopathic act enacted in 1941. As passed the bill (1) redefines osteopathy to mean "that system of treatment and healing of abnormalities of the human mind and body as taught and practiced in the standard colleges of osteopathy," (2) eliminates the subject of surgery as an examination requirement and (3) prescribes conditions under which osteopaths may practice major surgery and confines such practice to hospitals or institutions "osteopathically owned or controlled."

Bills Introduced.—S. 3-X proposes to make it a misdemeanor for any person infected with a venereal disease and, knowing of that condition, to engage in sexual intercourse. A second such offense is to be deemed a felony. S. 2-X proposes to authorize the state department of health to detain, hospitalize and quarantine any person known to be infected with a venereal disease. A person so detained and quarantined who wilfully refuses to submit to the treatment prescribed by the department is to be guilty of a misdemeanor. H. 18-X proposes to suspend in favor of any person during his active service with the military or naval forces of the United States the annual registration fees required by law.

New Jersey

Bill Passed.—A. 229 passed the assembly, April 13, proposing so to amend the chiropody practice act as to provide, among other things, that chiropody is "the diagnosis of any ailment of the human foot, or the treatment thereof by any one or more of the following means: local medical, mechanical, minor surgical, manipulative and physio-therapeutic or the application of

external medical or any other of the aforementioned means except minor surgical to the lower leg and ankle for the treatment of a foot ailment; not including, however, the treatment of tuberculosis, osteomyelitis, malignancies, syphilis, diabetes, tendon transplantations, bone resections, amputations, fractures, dislocations, the treatment of varicose veins by surgery or injection, the administration of anesthetics other than local, the use of radium, the use of x-ray except for diagnosis, or the treatment of congenital deformities by the use of a cutting instrument or electrosurgery. The term 'local medical' hereinbefore mentioned shall be construed to mean the prescription or use of a therapeutic agent or remedy where the action or reaction is intended for a localized area or part."

Bills Introduced.—A. 292 proposes to require a medical inspector who observes or finds a physical defect in the examination of a school child to notify the parents as to the defects found. If the parents fail to provide remedial treatment within a reasonable time, the child may be excluded from school until such time as remedial treatment has begun. A. 295, to amend the act relating to the public schools of the state, proposes to make it mandatory for the board of education to require immunization to diphtheria as a prerequisite to attendance at school or to require proof of immunity. A. 296, to amend the law relating to compulsory vaccination or revaccination of teachers and pupils in the public schools, proposes to make it mandatory for a board of education to exclude from school any teacher or pupil who has not been successfully vaccinated or revaccinated, unless the teacher or pupil shall present a certificate signed by the medical inspector appointed by the board that the teacher or pupil is an unfit subject for vaccination.

MEDICAL ECONOMIC ABSTRACTS

EXPENDITURES FOR MEDICAL CARE

During the period of 1934-1936 the United States Bureau of Labor Statistics, with the assistance of other government agencies, made numerous studies of consumer expenditures in the lower income brackets. These studies have now been combined

TABLE 1.—Expenditures for Medical Care

Annual Net Income	Average Number of Persons per Family	Medical Care		Per Cent of Total Current Expenditure
		Average Expenditure Per Family	Average Expenditure Per Person	
All families	3.60	\$ 59	\$16	2.9
\$500 to \$600	3.11	22	7	3.4
\$600 to \$900	3.13	33	10	2.9
\$900 to \$1,200	3.41	42	12	2.8
\$1,200 to \$1,500	3.54	53	15	2.9
\$1,500 to \$1,800	3.62	64	18	2.9
\$1,800 to \$2,100	3.76	78	21	4.2
\$2,100 to \$2,400	4.03	81	20	3.8
\$2,400 to \$2,700	4.27	97	23	4.0
\$2,700 to \$3,000	4.37	109	25	4.0
\$3,000 and over	4.81	115	24	2.5

in a "Summary Volume"¹ covering 14,469 families, with an average of 3.6 persons and an average income of \$1,458 located in forty-two cities with a population of over 42,000. No families in receipt of relief or with an annual income of less than \$300 during the year were included, nor any family in which the chief wage earner, classified as a clerical worker, received over \$2,000

a year, but no upper limit was placed on the income of wage earners or on the total family income. Only 1.0 per cent of the families had an average income of \$2,396 or an average per person of over \$1,200.

Table 1 summarizes the expenditures for medical care together with the comment:

"The figures on medical care expenditure represent medical, dental and hospital services purchased in general on an individual fee basis, drugs and medicines, medical appliances, and health insurance premiums. Unpaid medical bills, if incurred within the year of the investigation, are included as expenditures. The total cost of the medical services received by the families represented in the study was undoubtedly somewhat larger than this amount. Clinic and ward services are supported in part by endowments and contributions to hospitals and in part by services contributed by the medical staff. Some, but not many,

TABLE 2.—Families Reporting Service Charged For and Service Free

	Families Reporting Service	
	Charged For	Free
Room in hospital ward	29	6
Clinic	112	4
General practitioner:		
Home visit	315	0
Office visit	360	2
Specialist	128	2

of these families reported the payment of clinic fees, and as many as 4 per cent paid for beds in hospital wards. Information on the subject of free medical care was obtained only in New York. For the 897 white families of employed wage

patients who received service in outpatient departments of New York City.² This is 32 per cent instead of 1.2 per cent that was found among 897 families studied.

2. Rosensohn, Meyer: In the Matter of Pay for Doctors in Municipal Dispensaries, New York Medical Week 17:4 (Aug. 27) 1938.

The expenditure of the average family in this group for all forms of medical care was \$59.18, divided among the items shown in table 3.

EXPANSION OF LOCAL HEALTH ORGANIZATION

Nearly all local public health services except in the large cities have been organized within the last twenty-five years. There were only fourteen counties in the United States in 1915 with full time local service. After the passage of the Social Security Act in 1935 growth was rapid until on June 30, 1941 1,669, or 54 per cent, of the counties in the United States had such full time service. Six hundred and sixty-three of these were single district units, four hundred and twenty-six local district units and five hundred and eighty state district units. On the same date there were, in addition to those county services, one hundred and three cities with full time municipal health units. These one thousand six hundred and sixty counties and one hundred and three cities represented approximately 70 per cent of the total population of the forty-eight states and the District of Columbia. Additional full time service units are now being organized in many defense areas.¹

WOMAN'S AUXILIARY

Texas

The Northeast Texas District auxiliary met, recently, at Longview. Dr. Preston Hunt, Texarkana, spoke on national defense. A talk illustrated by motion pictures was given by Mrs. Walton Sumner on South America.

The Dallas County auxiliary met, recently, at the Dallas Country Club with one hundred and twenty members and four guests present. The auxiliary has for one of its special projects this year a study of antepartum care.

The Bexar County auxiliary met, recently, in San Antonio with one hundred and five members and five guests present. Mrs. S. F. Harrington, Dallas, president of the state auxiliary, spoke on the subject "Our Opportunities." Dr. Frank N. Haggard, San Antonio, spoke on "The Value of Organized Medicine." The auxiliary voted to give \$40 to the Community Chest. The auxiliary has been given the permission of the Bexar County Medical Society to use its club room, the Pill Box, once a month for parties for soldiers in service. Invitations have been extended to more than three hundred physicians in the army and their wives to participate in the activities of the Bexar County Medical Society and auxiliary.

Capt. Martin Adler, from the Air Corps Basic Flying School, Pottsboro, addressed the Grayson County auxiliary, recently, at Denison, on "The Cause of Rejection of Draftees and What Can Be Done About It." President Mrs. Lipscomb announced that the theme of the programs for the year would be the doctors' wives and national defense.

The Tom Green eight county auxiliary met on January 5 in the home of Mrs. Aubrey L. Lewis, San Angelo, with eight members and two visitors present. Mrs. Mildred M. Campbell, area recreation supervisor of the WPA, spoke on "Soldiers' Recreational Problems."

West Virginia

The Woman's Auxiliary to the McDowell County Medical Society met, recently, at the Appalachian Building in Welch. Mrs. H. P. Evans, president, called the meeting to order, and Mrs. Welch England, state president, spoke on "Nutrition and a World Crisis." A motion was carried to donate \$10 to the Crippled Children's Society. The Hygeia Committee reported twenty-five subscriptions for the schools.

The Woman's Auxiliary to the Raleigh County Medical Society met recently at Beckley. Mrs. E. Newton DuPuy, president, presided. There were thirty-three members and guests

present. Miss Mary Virginia Gill, executive secretary of the Raleigh County Tuberculosis Association, spoke on the tuberculosis program. Dinner was served and then several tables of bridge were formed.

Wisconsin

The Winnebago County medical auxiliary met recently at Oshkosh and elected the following officers: president, Mrs. W. N. Lum; president-elect, Mrs. G. C. Owen; secretary-treasurer, Mrs. E. B. Williams; parliamentarian, Mrs. J. W. Lockhart. A report on the national session in Cleveland in June was given by Mrs. Marvin Steen, who attended as a delegate. Mrs. T. D. Smith of Neenah reported on the state meeting held in Madison in September.

The Rock County auxiliary has been active in placing copies of *Hygeia* in homes, schools and libraries and in carrying out philanthropic projects. The Janesville group has worked for the benefit of Mercy Hospital and the Beloit members for the municipal hospital. All have cooperated in serving Pinelhurst, providing gifts for all patients at Christmas time and offering entertainment from time to time.

The auxiliary to the Winnebago County Medical Society decided to place *Hygeia* in beauty parlors in Oshkosh, Neenah and Menasha.

Nineteen members met at the home of Mrs. Henry Peters, Oconomowoc, for the meeting of the Waukesha County medical auxiliary. The annual election resulted as follows: president, Mrs. T. H. Nammacher, Oconomowoc; president-elect, Mrs. J. C. Frick, Waukesha; vice president, Miss Hertha Voje, Oconomowoc; secretary, Mrs. Floyd W. Aplin, Waukesha, and treasurer, Mrs. W. H. Oatway, Waukesha. Reports of the state meeting held in Madison were given by Mrs. Oatway, delegate, and Mrs. W. T. Murphy, alternate.

A former national and state president of the auxiliary, Mrs. R. E. Fitzgerald, Wauwatosa, spoke to the Rock County auxiliary recently. Mrs. Fitzgerald, who is also international president of Gamma Phi Beta sorority, is serving as National Parliamentarian of the Auxiliary to the American Medical Association. She stressed study clubs as a project, suggesting a program of legislation, the nutrition campaign of the American Medical Association and book reviews. Guests at the meeting included Mrs. E. P. Bickler, Milwaukee, state treasurer; Dr. Jessie Allen, Beloit, who organized the county auxiliary; Dr. J. R. Harvey, Footville, vice president of the Rock County Medical Society, and Dr. W. T. Clark, councilor for this district.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

ALABAMA

Changes in Health Officers.—Dr Caroline H Calhoun, Chatom, has been named health officer of Coosa County to succeed Dr William H Goff, Rockford, who resigned to enter private practice, it is reported.—Dr Isaac N Jones, Greensboro, has been appointed in charge of the Hale County health unit, succeeding Dr Eldridge T. Norman, Greensboro, who resigned to resume private practice.

Center for Poliomyelitis.—A new infantile paralysis center was recently opened at the Tuskegee Institute, forming a special unit of the John Alston Andrew Memorial Hospital. It is a three story fireproof building equipped with modern facilities, including a gymnasium with treatment pool, whirlpool arm and leg baths and electrotherapeutic machines, plaster, brace fitting and physical therapy rooms, sun deck, patient wards and laboratory. The center was made possible through a grant of more than \$172,000 from the National Foundation for Infantile Paralysis. A recent grant of \$30,000 will assist in the operation of the new unit.

ARKANSAS

Building for State Board of Health.—The Arkansas State Board of Health is erecting a five story building in Little Rock at a cost of \$150,000. The building is located on the west side of the state capitol grounds in accordance with the master plan of the state planning board for the beautification of the capitol grounds. The structure is fireproof, of reinforced concrete and faced with white limestone.

District Meeting.—The Fifth Councilor District meeting of the Arkansas Medical Society was held at the Garrett Hotel, El Dorado, recently, with the following speakers: Drs. Robert Lyle Motley, Memphis, Tenn., on "Diagnosis of Digestive Disturbances and Their Physiologic Explanation", Raphael Eustace Semmes, Memphis, "Rupture of the Intervertebral Disk as the Common Cause of Low Back Pain and Sciatica," and Charles B. Huggins and William W. Scott, Chicago, "Studies on Prostatic Cancer."

CALIFORNIA

State Medical Meeting, May 4-7.—The California Medical Association will hold its annual meeting in Del Monte, May 4-7, under the presidency of Dr Henry S. Rogers, Petaluma. Included among the out of state speakers will be Dr. Wallace H. Cole, Minneapolis, on "War Treatment of Fractures", Robert Commons, A.B., Boston, and Dr Arthur L. Guedel, Los Angeles, "Controlled Respiration", Dr. Carl M. Peterson, Secretary, Council on Industrial Health, American Medical Association, Chicago, "Wartime Problems in Industrial Medicine," and Dr Wallace M. Yater, Washington, D. C., "Diseases of the Heart Amenable to Surgical Treatment." Among California physicians participating in the program will be

Dr John Homer Woolsey, Woodland, Soft Tissue Wounds Gas Gangrene and Tetanus
Dr Lowell A. Runtz, San Francisco, Sulfonamide Medication
Dr Alfred C. Reed, San Francisco, Nutritional Enteritis as a Deficiency Syndrome
Dr Clinton H. Thunes, Los Angeles, Present Status of Vitamin P
Dr Leonid S. Chernov, San Francisco, New Transverse Low Abdominal Incision
Dr Arthur J. Hummelt, Oakland, Fluid Imbalance in Surgery—A Four Point Plan of Attack
Dr James W. Ravencroft, San Diego, Treatment of Incomplete and Inevitable Abortions
Dr Ervin H. Epstein, Oakland, Photosensitization in the Treatment of Psoriasis
Dr William T. Grant, Los Angeles, Clinical Diagnosis of Cerebellar Injuries

A number of symposiums will be included on the program, among which will be one on military surgery with the following speakers: Drs. Cole, "Present Status of the Treatment of Poliomyelitis", Frank S. Dolley, Los Angeles, "Chest Injuries in War", Lewis A. Mosen, Los Angeles, "Traumatic Shock and Hemorrhage," and Don D. Weaver, Oakland, "Treatment of Burns." Representatives of the medical corps of the army and navy will be on the general program.

GEORGIA

The Fischer Awards.—The L. C. Fischer award of \$100 for the best written paper presented before the Fulton County Medical Society showing the most original research went to Drs. Carter Smith, Henry Clifford Sauls and Charles F. Stone Jr. for their paper entitled "Subacute Bacterial Endocarditis Due to Streptococcus Viridans." A similar prize for research was won by Drs. Emmett D. Cohn, Rudolph A. Bartholomew and William H. Grimes Jr. on "Interpretation of Blood Pressure Behavior During Pregnancy and the Puerperium." All are from Atlanta.

Laboratory for Diseases of Eye.—The Eye Pathological Laboratory of Grady Hospital, Atlanta, was recently opened. The unit occupies space in the Gray Clinic of the hospital and will be available to all ophthalmologists. It is the gift of Mr. L. F. Montgomery, Atlanta, an alumnus of Emory University. Drs. F. Plumley Calhoun Jr. and William T. Edwards Jr. are in charge of the laboratory. According to the *Bulletin* of the Fulton County Medical Society the laboratory is the only one of its type in the Southeast and is one of about nine of its kind in the country.

Railway Surgeons' Meeting.—The twenty-second annual meeting of the Surgical Association of Atlanta and West Point Railroad Company, the Western Railway of Alabama and Georgia Railroad was held at the Atlanta Biltmore Hotel, March 26. Major Dwight M. Kuhns, U. S. Army, Medical Corps, in charge of the fourth corps area laboratories, Fort McPherson, was the guest speaker on "Measures Being Taken to Protect Troops from Diseases and Infections Following Wounds." Other speakers were Drs. Harry L. Cheves, Union Point, "Traumatic Abdomen", Lewis S. Patton, Athens, "Injuries of the External Eye and Uses of the Sulfonamides in Their Treatment"; Charlie N. Wasden, Macon, "Concussions of the Brain", William Howard Hailey, Atlanta, "Dermatoses in Railroad Workers," and Wallace H. Clark, LaGrange, "Injuries to the Genito-Urinary Tract." Dr. Floyd W. McRae, Atlanta, gave the presidential address.

ILLINOIS

Graduate Conference in Belleville.—The Missouri and Illinois Post-Graduate Committees sponsored a joint clinical conference in Belleville, April 9. Included among the speakers were

Dr. Cyrus E. Burford, St. Louis, Urology—Diagnosis and Significance of Hematuria
Edmund U. Cowdry, Ph.D., St. Louis, Gynecitics
Dr. Walter M. Whitaker, Quincy, Ill., The Role of Fluid Balance in Pediatrics
Dr. Francis J. Draceland, Chicago, Psychiatry—Recognition of the Psychopathic State in the Selectee
Dr. Harold M. Camp, Monmouth
Col. Paul G. Armstrong, Springfield

Tumor Diagnostic Service.—The state department of health has established the third state subsidized tumor diagnostic service at St. Anthony's Hospital in Rockford. Similar services were established at the Methodist Hospital of Central Illinois, Peoria, and at the Memorial Hospital in Springfield. Although the state division of cancer control directs the diagnostic service, the actual management will be the responsibility of the consulting hospitals, which are chosen by the local county medical society. The tumor diagnostic services are designed to provide for the general practitioner a competent consultation service without cost for his suspected cancer cases. No treatment is rendered in any case.

Chicago

Portrait of Dr. Anna Lapham.—Exercises were held on March 17 to dedicate a portrait of Dr. Anna Ross Lapham, assistant professor of obstetrics, Northwestern University Medical School. Dr. Lapham graduated at Northwestern University Woman's Medical School in 1898. She joined the staff of Northwestern University Medical School in 1919 as a demonstrator. In 1922 she became instructor and in 1926 assistant professor. Although she retired in 1929, her name is still included on the list of active instructors. Dr. Lapham was the first woman to reach the rank of assistant professor at the medical school.

Dr. De Lee's Will.—In the will of the late Dr. Joseph B. De Lee bequests provide for establishment of the Joseph Bohvar De Lee Endowment for Medical Education at Northwestern University Medical School and a foundation bearing his name for teaching and research of Northwestern University Medical School and its clinics. The first was provided for with annuity funds of \$10,000 arranged for in 1923 to take effect on his death and the second fund of \$100,000 was created in 1929.

Another \$5,000 goes to the Chicago Maternity Center, which Dr. De Lee founded. The will further stipulates that if \$25,000 remains after specific bequests, a fund to give an annual award for the greatest contribution to obstetrics is to be established in honor of Dr. De Lee's late brother, Solomon Theron De Lee.

KANSAS

New Executive Secretary.—Mr. Oliver Ebel, for five years chief probation officer of the Sedgwick County Juvenile Court, Wichita, has been appointed executive secretary of the Sedgwick County Medical Society. Mr. Ebel succeeds Mr. Jack F. Austin, Wichita, who recently went into army service.

MARYLAND

State Medical Meeting in Baltimore.—The Medical and Chirurgical Faculty of the State of Maryland will hold its one hundred and forty-fourth annual meeting in Baltimore, April 28-29, under the presidency of Dr. Robert Lee Hall, Pocomoke City. Dr. Cyrus C. Sturgis, Ann Arbor, Mich., will deliver one Trimble Lecture on "Syndromes Associated with Leukopenia," and Dr. John Homans, Boston, will give one on "Vasomotor and Other Reactions to Injuries and Venous Thrombosis." There will be a panel discussion on the health of the state as revealed through selective service and army examinations. On Wednesday a round table luncheon will feature a wide range of medical topics. Other speakers on the program will include:

Dr. Hall, Changes in the Practice of Medicine in the Counties of Maryland in the Last Forty Years.
Dr. Thomas B. Aycock, Baltimore, Causalgia.
Dr. Thomas Nelson Carey, Baltimore, Rocky Mountain Spotted Fever.
Dr. Nels A. Nelson, Baltimore, Syphilis in Industry.
Dr. Kenneth L. Pickrell, Baltimore, Local Treatment of Burns.
Dr. Edgar J. Poth, Baltimore, A New Intestinal Antiseptic—Succinyl Sulfathiazole.
Dr. Thomas P. Sprunt, Baltimore, Blood Plasma Proteins.
Dr. Caroline C. Bedell Thomas, Baltimore, Rheumatic Fever.
Dr. Isaac Ridgeway Trimble, Baltimore, Sympathectomy in Peripheral Vascular Diseases.
Dr. Henry P. Ulrich, Baltimore, Ununited Fractures.
Dr. Maxwell M. Wintrobe, Baltimore, Vitamin Deficiencies.
Col. Leon A. Fox, M. C., U. S. Army, chief health officer, Caribbean Division, The Doctor in War.

MASSACHUSETTS

Evans Memorial Lecture.—Dr. William Dock, professor of pathology, Cornell University Medical College, New York, delivered the Robert Dawson Evans Memorial Lecture in the Evans Memorial Auditorium, Boston, March 27. His subject was "Albuminuria and Associated Renal Changes."

New Secretary of State Board.—Dr. Harold Quinby Gallupe, Waltham, has been elected secretary of the Massachusetts Board of Registration in Medicine to succeed Dr. Stephen Rushmore, Boston, who resigned to become dean of Middlesex University School of Medicine, Waltham. Dr. Gallupe graduated at Harvard Medical School, Boston, in 1918.

Changes at Harvard Medical School.—John H. Mueller, Ph.D., associate professor of bacteriology and immunology, has been named professor of bacteriology and immunology at the Harvard Medical School, Boston, effective July 1. He will also take charge of the department at the medical school and at the school of public health. The following men were named to associate professorships: Dr. Fuller Albright, now assistant professor of medicine; Dr. Allan M. Butler, now assistant professor of pediatrics, and Dr. Hiram H. Merritt, now assistant professor of neurology. Dr. Frederick J. Stare, who graduated at the University of Chicago School of Medicine in 1941, has been appointed assistant professor of nutrition.

MICHIGAN

Change in Health Officers.—Dr. Sue Hurst Thompson, West Branch, has resigned as director of district health unit number 2 comprising the counties of Ogemaw, Oscoda, Iosco and Alcona. Dr. Harold W. Seff, West Branch, is the acting director, pending a permanent appointment in June.

The Hickey Lecture.—Dr. Eugene P. Pendergrass, professor of radiology, University of Pennsylvania School of Medicine, Philadelphia, delivered the sixth annual Hickey Memorial Lecture before the Wayne County Medical Society on April 6. His subject was the roentgen diagnosis of pneumoconiosis and silicosis.

Personal.—Dr. Franklin H. Top has been appointed by the Detroit board of health as medical director of the Herman Kiefer Hospital, Detroit.—Dr. Carey P. McCord, Detroit, has been elected to extramural lectureship on occupational diseases at the new School of Public Health of the University of Michigan, Ann Arbor.

Society News.—Dr. Chevalier L. Jackson, Philadelphia, recently discussed "The Bronchoscope and Its Role in Modern Medicine" before the Wayne County Medical Society, Detroit. Dr. Richard H. Overholt, Brookline, Mass., also addressed the society recently on "A Common Masquerading Lung Disease."—Dr. Fred J. Hodges, Ann Arbor, recently addressed the Kalamazoo Academy of Medicine in Kalamazoo on "The Cyclotron as a Medical Instrument."—Dr. Vincent J. O'Connor, Chicago, addressed the Muskegon County Medical Society in Muskegon, March 20, on "Urologic Significance of Low Back Pain."—Dr. Samuel F. Marshall, Boston, discussed "Medical and Surgical Treatment of Gastric Lesions" before the Ingham County Medical Society in Lansing, March 17.

MISSOURI

Leo Loeb Receives Award.—The St. Louis Medical Society presented its award of merit and gold medal, March 3, to Dr. Leo Loeb, emeritus professor of pathology, Washington University School of Medicine. Dr. Loeb was born in Germany in 1869. From 1889 to 1896 he studied natural science and medicine at the universities of Heidelberg, Berlin, Zurich and Freiburg. He was assistant professor of experimental pathology at the University of Pennsylvania School of Medicine, Philadelphia, from 1904 to 1910, when he went to direct the department of pathology at the Barnard Skin and Cancer Hospital, St. Louis. In 1915 he became professor of comparative pathology at Washington, and in 1924 he became professor of pathology. He served as president of the Society of Cancer Research in 1911 and of the American Association of Pathologists and Bacteriologists, 1914-1915. From 1910 to 1912 he was chairman of the Section on Pathology and Physiology of the American Medical Association. Dr. Loeb's principal contributions through research have been on tissue and tumor growth. In acknowledging the award before the society, Dr. Loeb gave an address entitled "Medicine and the Community."

NEBRASKA

State Medical Meeting in Omaha.—The seventy-fourth annual meeting of the Nebraska State Medical Association will be held at the Hotel Fontenelle, Omaha, May 4-7, under the presidency of Dr. Dexter D. King, York. Guest speakers will include:

Dr. Henry W. F. Woltman, Rochester, Minn., Postoperative Neurologic Complications.
Dr. Marcus H. Hobart, Evanston, Ill., Treatment of Athletic Injuries.
Dr. Benjamin Goldberg, Chicago, The Present Day Tuberculosis Problem.
Dr. LeRoy H. Sloan, Chicago, Bedside Neurology for the General Practitioner.
Dr. Samuel J. Kopetzky, New York, Experiences in This War.
Dr. William T. Peyton, Minneapolis, Surgical Relief of Pain.
Dr. Rexford L. Diveley, Kansas City, Mo., Emergency Treatment of Fractures—How to Handle Various Types of Fractures Before They Are Reduced.
Dr. Wyman C. Corydon Cole, Detroit, Establishment of Respiration in the Newborn—Influence of Ether Anesthesia.
Dr. Willard O. Thompson, Chicago, Endocrine Problems in the Male.
Dr. Jacob P. Greenhill, Chicago, Soft Parts Dystocia.

A symposium on chemotherapy will be held on Tuesday afternoon with Nebraska physicians participating. On Tuesday evening a dinner session will be addressed by Mr. J. W. Holloway Jr., Director, Bureau of Legal Medicine and Legislation, American Medical Association, Chicago, on "Medical Licensure in Nebraska."

NEW YORK

Hospital News.—Jamaica Hospital, Jamaica, recently observed its fiftieth anniversary. One of the features of the celebration was the publication of a book entitled "The Jamaica Hospital, a History of the Institution," written by Dr. Francis G. Riley, Jamaica, for many years director of the department of urology.

Gastroenteritis Outbreak in Defense Community.—About one third of the population was affected in an outbreak of about 1,500 cases of gastroenteritis in February in a village in Delaware County. According to *Health News* the illness began suddenly and was characterized by vomiting and abdominal pain. There were no fatalities. A large number of the residents of this village and two neighboring communities are employees of the large manufacturing plant working on the defense program. Further study is being made to determine the exact origin of the outbreak.

Symposium on Dental Caries.—Three symposiums on dental caries were sponsored recently by the state medical and dental societies of the state department of health, cooperating with local organizations. The meetings were in Rochester on March 31, Binghamton on April 1 and Albany on April 2. The speakers were, Dr. Julian D. Boyd, associate professor of

pediatrics, State University of Iowa College of Medicine, Iowa City; Philip Jay, D.D.S., assistant director for oral pathology, University of Michigan School of Dentistry, Ann Arbor, Mich., and Henry Trendley Dean, D.D.S., U. S. Public Health Service. The symposiums correlated the research which has been carried on recently in the following three channels: the effect of nutrition, the effect of bacteria in the mouth and the effect of the chemical content in drinking water.

New York City

Hugh H. Darby Joins Borden Company.—Hugh H. Darby, Ph.D., associate, department of biochemistry, of Columbia University College of Physicians and Surgeons, and known for his contributions in vitamin research, has joined the staff of the Borden Vitamin Company for research and development in the production and application of vitamins and hormones. Dr. Darby, a native of Scotland, received his Ph.D. at Columbia in 1928. He is identified as a discoverer of the existence of vitamin D in plant life and for his spectrographic research on vitamins A, D and K.

Research Meeting.—The Research Society of the Long Island College of Medicine, Brooklyn, met at the college, April 8, for the following program: Dr. Victor Rudomanski, "Quantitative Study of Plasma and Extracellular Fluid Volume Changes in Some Instances of Dehydration"; Dr. Louis C. Johnson, "A Comparative Study of the Complement Fixation and Flocculation Tests in the Diagnosis of Syphilis," and George H. Paff, Ph.D., and Robert A. Lehman, Ph.D., "A Practical Technic and Design for the Assay of Digitalis on the Embryonic Chick Heart." The Long Island College of Medicine sponsored a symposium on psychosomatic medicine, March 26. The speakers included Drs. G. Canby Robinson, Baltimore, H. Russell Meyers, George Draper, Bela Mittelmann, George E. Daniels and Foster Kennedy.

NORTH CAROLINA

Health of Indians.—With a total Indian population in the state of 22,690, North Carolina reports an Indian birth rate of 40 per thousand and a death rate of 7.9. More than eight hundred Indian babies are born in the state each year. Indians share in all public health benefits in North Carolina on the same basis as other citizens. During one year 246 mothers visited the maternal and infancy clinics for antepartum advice. During the same year there were 47 infant visits to clinics. There were 123 Indians on the crippled children's register of the state board of health receiving orthopedic attention. Three field health workers follow up these cases and make home visits.

PENNSYLVANIA

Tuberculosis Society Observes Fiftieth Anniversary.—The Pennsylvania Tuberculosis Society will observe its fiftieth anniversary at a dinner meeting in the Bellevue-Stratford Hotel, Philadelphia, May 7, during the annual session of the National Tuberculosis Association, May 6-9. The Pennsylvania group claims to be the first voluntary tuberculosis society in the country, having been formed in 1892 as the Pennsylvania Society for the Prevention of Tuberculosis.

Immunization Project.—At a recent meeting of the board of trustees of the state medical society, Drs. Alexander Hamilton Stewart and John Moore Campbell Jr., Harrisburg, representing the state department of health, asked cooperation in a proposed comprehensive program of immunization of children over the age of 9 months against smallpox, diphtheria and tetanus. They stated that it was the wish of the department to have these immunizations performed by practicing physicians rather than in state clinics, with the department of health continuing to supply the vaccines and toxoids needed. The board of trustees of the state society endorsed the recommendation and urged active cooperation by the membership of the society.

Pittsburgh

Society News.—The Allegheny County Medical Society devoted its meeting, March 17, to a symposium on diseases of the genitourinary tract; the speakers were Drs. Edward J. McCague, James J. Lee, Joseph G. Moore and John L. Hamilton. The society devoted its February 17 meeting to a symposium on malignant lesions of the colon. The speakers were Drs. John D. Garvin, Leo P. Sheedy, John W. Stinson, Joseph W. McMeans and Kenneth M. Day.—Dr. Harold I. Lillie, Rochester, Minn., discussed "Vasomotor Rhinitis: Résumé of Labyrinthectomy Operation" before the Pittsburgh Otolological Society on March 25.

SOUTH DAKOTA

State Medical Meeting in Sioux Falls.—The sixty-first annual session of the South Dakota State Medical Association will be held in Sioux Falls, May 13-15, under the presidency of Dr. Bertrand M. Hart, Onida. The tentative program lists the following speakers:

- Dr. Edward L. Tuohy, Duluth, Minn., The Treatment of the Patient Over Fifty.
- Dr. Hewitt B. Hannah, Minneapolis, Shock Treatment in Mental Disease: Insulin, Metrazol and Faradism.
- Dr. Samuel E. Sweitzer, Minneapolis, Common and Obscure Skin Diseases.
- Dr. Leo G. Rigler, Minneapolis, X-Ray Diagnosis.
- Dr. Herbert Z. Giffin, Rochester, Discussion of Iron, Liver Extract and Vitamins in the Treatment of Various Types of Anemia.
- Dr. Arnold Schwyzer, St. Paul, Abdominal Pain and Its Local Significance.

An interprofessional program will be held on Thursday afternoon in the form of a symposium covering the "Relationship of the Medical, Dental, Pharmaceutical, Nursing and Hospital Associations to the National Defense Program."

TEXAS

State Medical Association Meeting in Houston.—The seventy-sixth annual session of the State Medical Association of Texas will be held at the Rice Hotel, Houston, May 11-14, under the presidency of Dr. Neil D. Buie, Marlin. Out of state speakers will include:

- Dr. Leonard G. Rowntree, colonel, U. S. Army, Washington, D. C., Medical Aspects of Selective Service.
- Dr. Chester A. Stewart, New Orleans, The Feeding of Infants and Children.
- Dr. Tom D. Spies, Cincinnati, Diagnosis of Deficiency Diseases.
- Dr. Fred J. Hodges, Ann Arbor, Mich., The Responsibility of the Roentgenologist in Gastrointestinal Diagnosis.
- Dr. Edwin C. Hamblen, Durham, N. C., Some Complications and Untoward Responses to Endocrine Therapy.
- Dr. Elexious T. Bell, Minneapolis, Nephritis and Nephrosis.
- Dr. Otto Jason Dixon, Kansas City, Mo., Ear Complication in Relation to General Practice.
- Dr. Vilray P. Blair, St. Louis, Cancer of the Mouth.
- Dr. John H. Musser, New Orleans, The Heart That Grows Old.
- Dr. Louis A. Buie, Rochester, Minn., Important Facts Concerning the Diagnosis and Management of Lesions of the Terminal Colon.
- Dr. Thomas L. Pool, Rochester, Lesions of the Bladder and Urethra Occurring in Women.
- Dr. Edward N. Smith, Oklahoma City, The Treatment of Nausea and Vomiting of Pregnancy.
- Dr. Arthur E. Herizler, Halstead, Kan., The Principles of Abdominal Drainage.

Other societies meeting during the state session include the Texas Railway and Traumatic Surgical Association, Texas State Heart Association, Texas Association of Medical Anesthetists, Texas Chapter of the American College of Chest Physicians, the Conference of County and City Health Officers of Texas and the woman's auxiliary to the state medical association.

VIRGINIA

Graduate Course in Industrial Hygiene and Medicine.—A concentrated course for physicians who are going into the field of industrial medicine is now being conducted at the Medical College of Virginia, Richmond, in cooperation with the bureau of industrial hygiene of the state health department, the industrial commission of Virginia, the state department of education and the medical departments of several industrial industries in and around Richmond. Emphasis is placed on the actual practical experience with medical directors in industry.

WASHINGTON

Personal.—Dr. Robert S. Hamilton has been appointed health officer of Clallam County and the city of Port Angeles, succeeding Dr. Alfred E. Eyres who recently resigned to take additional work in public health.—Dr. Calvin L. Longstreth has been appointed health officer for Bellingham.

Society News.—The Spokane County Medical Society was addressed, April 9, by Drs. Hale A. Haven, Seattle, on "Neurosurgical Treatment of Angina Pectoris: Physiologic and Anatomic Factors with Clinical Results," and Joel W. Baker, Seattle, "Physiology and Surgery in Duodenal Ulcer."—The Spokane Surgical Society held an all day session on April 25 with Dr. Richard B. Cattell, Boston, as the guest speaker; at the banquet in the evening he discussed "Selection of Operation for Carcinoma of the Colon and Rectum."—At a meeting of the King County Medical Society in Seattle, March 16, the speakers were Drs. Goodrich C. Schauffer, Portland, Ore., on "The Female Genitalia in Childhood and Infancy," and Harold G. Trimble, Oakland, Calif., "Tuberculosis—The General Practitioner's Problem."

GENERAL

No Examination in Dermatology.—Because of an insufficient number of candidates, the American Board of Dermatology and Syphilology announces that no examination will be held in June at the time of the meeting of the American Medical Association. An examination will probably be held in the fall, notice of which will be published later.

Cancer Campaign Opens.—The American Society for the Control of Cancer, New York, launched its sixth annual educational campaign against cancer, April 1, under the slogan "Conquer Fear, Delay and Ignorance." The campaign aims to emphasize the fact that cancer is curable, to make known to every one the early symptoms by which its onset may be recognized and to point out that to effect a cure treatment must begin promptly after a diagnosis of cancer.

Prize Winners in Safety Contest.—Oklahoma was the national grand prize winner for states in the traffic safety contest sponsored by the National Safety Council, it was recently announced, and Memphis, Tenn., the winner for cities. Oklahoma won the award because of its record of placing first among all states in the southern division for five consecutive years and Memphis for overcoming the handicap of increased traffic on account of war industries and army movements with the reduction of fatalities by 56 per cent. Two other states and five other cities won first place awards in their divisions of the contest: Oregon in the western division, New Jersey in the eastern; Pittsburgh, Omaha, Manchester, N. H., Fond du Lac, Wis., and Aberdeen, S. D., are the five cities which also won first place awards in certain population groups.

Medical Library Meeting.—The Medical Library Association will hold its annual meeting in New Orleans, May 7-9, under the presidency of Miss Mary Louise Marshall, New Orleans. The scientific program will open with a symposium on tropical medicine presented by the following: Dr. George W. McCoy, New Orleans, "Tropical Medicine: Scope and Achievements"; Ernest Carroll Faust, Ph.D., New Orleans, "Amoebiasis, a Tropical and Cosmopolitan Disease"; Dr. Mark F. Boyd, Tallahassee, Fla., "Malaria," and Dr. Guy H. Faget, Carville, "The Story of Leprosy in the United States." The annual dinner will be addressed by Dr. Rudolph Matas, professor of general and clinical surgery emeritus, Tulane University of Louisiana School of Medicine, New Orleans, on "Some Episodes in the Medical History of Louisiana." One session will be devoted to medicine in the Confederacy and another to general reference books of interest to the medical librarian.

Association of the History of Medicine.—The eighteenth annual session of the American Association of the History of Medicine will be held at Chalfonte-Haddon Hall, Atlantic City, N. J., May 3-5. Dr. Jabez H. Elliott, Toronto, Ont., will deliver his presidential address at the dinner Monday evening on "Observation and Interpretation" and Dr. Hugh H. Young, Baltimore, will give an address in commemoration of the one hundredth anniversary of the first application of ether anesthesia, entitled "Crawford W. Long: The Pioneer in Ether Anesthesia." Among other speakers on the program will be:

Dr. Ernest E. Irons, Chicago, Théophile Bonet.
Dr. Benjamin Spector, Boston, Sir Charles Bell and the Bridgewater Treatises.
Dr. Theodore G. H. Drake, Toronto, The Medical Caricatures of Thomas Rowlandson.
Dr. Maurice S. Jacobs, Philadelphia, Thomas Beddoes and His Contribution to the Treatment of Tuberculosis.
George Urdang, D.Sc. Nat., Madison, Wis., The Mystery About the English Pharmacopeia (1618).

The William Osler Medal will be presented this year to John T. Barrett, A.B., of the Boston University School of Medicine. Dr. Francis R. Packard, Philadelphia, will deliver the Fielding H. Garrison Lecture Monday afternoon on "Medical Case Histories in a Colonial Hospital."

Medical Aid to China.—More than a million dollars will be required during the fiscal year ending April 1, 1943 to maintain and expand medical relief work in China, according to a budget estimate issued by the American Bureau for Medical Aid to China. In addition, United China Relief has been asked to allocate more than a million dollars in the current fiscal year for new projects including the establishment of nutritional, maternity and child health centers and a broad medical education program designed to provide skilled personnel needed in China. The largest outlay of funds will be to the Emergency Medical Service Training School program now being conducted under the direction of Dr. Robert K. S. Lim, Peiping. United China Relief states that the budget estimate does not include a proposed expenditure of \$100,000 for a research program which will be carried out this year, if conditions permit, in cooperation with the Chinese Red Cross

Medical Relief Corps, the Chinese National Health Administration and American specialists. This program would embrace among other things the study of the effect of sulfonamide drugs on important epidemic diseases.

Meeting of Association of American Physicians.—The fifty-seventh annual meeting of the Association of American Physicians will be held in Chalfonte-Haddon Hall, Atlantic City, N. J., May 5-6, under the presidency of Dr. James H. Means, Boston. Among the speakers will be:

Dr. Luther Emmett Holt Jr., Dr. Maxwell M. Wintrobe, Anthony A. Albanese, Ph.D., and Landrum B. Shettles, Ph.D., Baltimore, Experimental Amino Acid Deficiencies in Man.
Dr. Frederic M. McPhedran, Edwin L. Lane, Henry P. Close and Edwin S. Cooper, Philadelphia, The Mechanism of Healing of Tuberculosis Cavities.
Dr. Harold W. Jones, Dr. Leandro M. Tocantins, Dr. Lowell A. Erf and Ferdinand L. Munro, Ph.D., Philadelphia, Concentrated Blood Plasma, Intrasternally, in the Treatment of Shock.
Dr. Ralph A. Kinsella, Samuel Rabinovitch and Joseph J. Furlong, St. Louis, Hyposthenia.
Dr. Roy W. Scott and Curtis F. Garvin, Cleveland, Unusual Cardiac Mechanism Associated with Metastatic Cancer Involving the Left Auricle.
Dr. John E. Howard, Lawson Wilkins and Walter Fleischmann, Baltimore, The Metabolic and Growth Effects of Various Androgens in Sexually Immature Dwarfs.
Dr. Willard O. Thompson, Norris J. Heckel and Richard P. Morris, Chicago, Chorionic Gonadotropin: A Potent Stimulator of Growth.
Dr. Wintrobe, Mitchell H. Miller and Richard H. Folliis Jr., Baltimore, What Is the Antineuritic Vitamin?

Mead Johnson Award Goes to Dr. Cowgill.—George R. Cowgill, Ph.D., associate professor of physiologic chemistry, Yale University School of Medicine, New Haven, Conn., was presented on April 1 with the \$1,000 Mead Johnson and Company Prize by the American Institute of Nutrition for researches dealing with the B complex vitamins. According to the citation, Dr. Cowgill received the award "for his fundamental contributions through experimental research on the B vitamins, his leadership in interpreting results of research and his influence in promoting advances in this field of knowledge." The prize is given annually to the research worker in the United States or Canada who, in the opinion of judges representing the American Institute of Nutrition, has published the most meritorious work dealing with the field of B complex vitamins or who has made valuable contributions over an extended period of time. Dr. Cowgill was born in St. Paul in 1893. He received his Ph.D. at Yale in 1921. He was on the staff of Stanford University from 1916 to 1917 and went to Yale University Medical School in 1920. He has been associate professor since 1931. Dr. Cowgill is a member of the Council on Foods and Nutrition of the American Medical Association and of the vitamin advisory committee of the U. S. Pharmacopeia. He has served as editor of the *Journal of Nutrition* since 1939.

Psychiatric Meeting.—The ninety-eighth annual meeting of the American Psychiatric Association will be held at the Hotel Statler, Boston, May 18-21, under the presidency of Dr. James K. Hall, Richmond, Va. There will be sessions devoted to morale and military psychiatry, psychiatry and the U. S. Navy, geriatrics, psychosomatic medicine and schizophrenia. Among the speakers will be:

Dr. Miguel Ozorio de Almeida, director, Laboratory of Physiology, Instituto Oswaldo Cruz, Rio de Janeiro, Brazil, Experimental Epilepsy of the Frog.
Dr. Joseph C. Michael, Minneapolis, Multiple Murders Without Comprehensible Motivation.
Dr. Nathaniel J. Berkwitz, Minneapolis, Electric Subconvulsive Shock Therapy of Psychoses Associated with Alcoholism, Drug Addiction and Syphilis.
Dr. Herbert S. Ripley Jr., Charles A. Bolmengel and Ade T. Milhorat, New York, Personality Factors in Muscle Disease.
Dr. Simon Stone, Manchester, N. H., Nonspecific Therapy of Neurosyphilis.
Dr. Earl D. Bond and Thurston D. Rivers, Philadelphia, Follow-Up Studies in Insulin Shock.
Dr. Edward F. Reaser, Huntington, W. Va., Treatment of Catatonic Stupor with Amyl Nitrite and Physiotherapy.
Dr. Oskar Diethelm and Fred V. Rockwell, New York, A Study of the Psychopathology of Aging.
Dr. Herman I. Wurtis and William S. Maurer, New York, "Sham Rage" in Man.
Dr. William A. Horsley Gantt, Baltimore, Measures of Susceptibility to Nervous Breakdown.
Dr. Juliette Louise Despert, New York, Psychopathology of Stuttering.

On Monday evening a public meeting will be addressed by Leonard T. Carmichael, Ph.D., president of Tufts College, Medford, Mass., on "The Contributions of Scientific Psychology to the National War Effort" and Dr. Arthur H. Ruggero to the National War Effort" and Dr. Arthur H. Ruggero, Providence, R. I., "Psychiatric Problems in a Changing World." Tuesday evening there will be a series of round table discussions on alcohol, applications of psychoanalysis to the national emergency, civilian mental health and morale, a special report on experimental data on the unconscious, and military psychiatry.

Statement by New York Psychoanalytic Society and Institute.—This organization has published a statement in which are given the principles governing psychoanalytic education in the New York Psychoanalytic Institute and also the nature of the violations of these principles which in recent years have caused disagreement among workers in the institute. These educational principles are as follows:

1. A preparatory personal analysis is the first essential step in the training of every student, since a psychoanalyst must have a clear understanding of his own emotional make-up in order not to confuse his own personality with his therapeutic efforts. In the preparatory analysis the relationship of the student in training to his analyst is the same as that of a patient to a psychoanalyst. It is doubly necessary, therefore, that the preparatory analysis should be conducted in an atmosphere of quiet scientific objectivity, without injecting the student into the midst of any heated controversy, and certainly without enlisting the student as an ally in any dispute.

2. Once the student is allowed to undertake the analysis of patients, he is encouraged to conduct these analyses under the supervision of instructors who represent varying theoretical and technical points of view.

3. Intermediate and advanced students must have and are given an opportunity to attend seminars for the presentation and discussion of all points of view. It is an injustice to students to allow them to come under the exclusive influence of any single attitude.

4. New theories and clinical findings should first be presented not to elementary students but at scientific meetings of the society, where they can be critically evaluated; and modifications in technic should first be tried out only by those who are already mature in experience.

In recent years, the statement says, the educational committee of the society and institute came to realize that the basic principles referred to were being violated and that the training of certain groups of students was not meeting the requirements of the institute. It is pointed out in the statement (1) that increasing confusion was revealed among elementary students, together with an unscientific tendency to form groups around the persons of individual instructors and to reject the ideas of others with scant hearing; (2) a survey of the distribution of students disclosed that the scope of training was being circumscribed in the case of some students, who remained almost entirely under a single theoretical point of view through each successive stage of their instruction; (3) that in certain instances the relationship of teacher and student was being used as an opportunity to gather together a band of disciples under the pretext of "academic freedom"; (4) students were in some instances encouraged to make radical technical departures from established procedures which they had not yet mastered.

Direct action on these problems was avoided over a period of years in an effort to settle the controversy by the gradual process of scientific education, but these efforts were frustrated. It finally became the duty of the institute to correct the situation, and in April 1941 the educational committee recommended that "Dr. Horney's teaching be limited to lecturing." This recommendation was submitted to the floor of the society and was passed "by an overwhelming majority." The instructor resigned and this was followed by the resignation of four adherents and by the withdrawal of fourteen students. At that time there were eighty-eight members of the New York Psychoanalytic Society and Institute and one hundred and ten students.

The group which withdrew has organized a society under the name of "The Association for the Advancement of Psychoanalysis" and a training institute, which it calls the "American Institute for Psychoanalysis." Since the name of the new group may be a source of confusion to the outside world, and since it takes exception to the "unfounded allegations" which have been advanced as the occasion for these steps and because many questions have been addressed to the society indicating that this situation affects the public interest, the New York Psychoanalytic Society resolved to issue a statement.

The statement points out that for many years the institute carried on its educational activities in an informal fashion, but when the student body grew to more than a hundred the casual arrangements no longer functioned smoothly. A review was made of the records of the student body, and a reorganization of the curriculum was undertaken, based on the students' replies to questionnaires and a study of methods used in other psychoanalytic institutes. The curriculum was divided into a minimum of three years of work and the courses which had been informally considered as essential became formal requirements, additional required courses and electives were provided, and

many new instructors were given an opportunity to teach. A few members of the teaching staff whose methods and theories differed from those of the majority immediately voiced their fear that the reorganization would be used as an opportunity to exclude them from teaching. The dissident group continued to claim that it was the object of unfair discrimination, and these charges after being examined repeatedly by different members and by appropriate committees were finally brought to the floor of the society.

The New York Psychoanalytic Society and Institute is said to be the only organization for training in psychoanalysis chartered by the University of the State of New York and the only institute in New York State recognized for such training by the American Psychoanalytical Association.

FOREIGN

Public Health Under Hitler's Rule.—Typhus has been reported in North Norway, and compulsory vaccination has been ordered in districts liable to infection. According to the *Svenska Dagbladet*, 10,000 people have been vaccinated against typhus and smallpox. The district commissioner of Riga has forbidden all public gatherings in order to prevent the spread of typhus, according to the *Stockholm Tidningen*, February 17.

The school children according to the February 22, and six classes in one school were to have been closed until the children had been deloused. The home secretary has decided, according to the *Berlingske Tidende*, Copenhagen, to introduce legislation providing for compulsory delousing. Typhus has entered central Europe as a result of the Russo-German war, and, according to the *Aftonbladet*, Stockholm, February 24, has entered Denmark from her warring neighbor. The German minister of health, who visited Copenhagen in January to lecture about public health, said that a line had been drawn in the east "over which the lice could not advance," but it is presumed that the lice reached Germany before this line was established. A medical officer at Malmö believes that the danger of typhus infection in Sweden via Denmark is negligible owing to the reduction in traffic. The appearance of typhus at such inland towns as Aarhus, Randers and Aalborg is considered to be due to the large German garrisons there, which are periodically relieved. The Aalborg public health committee has asked the home office, according to *Boersen*, Copenhagen, February 14, to authorize the compulsory delousing of infested persons and also for compensation for damage caused to property by the delousing process. There is said to be real danger of typhus in Aalborg.

According to *Lyons National*, February 19, official communiqué number 86 stated that the German authorities were contemplating the repatriation of prisoners who were students in medicine, pharmacy and dental surgery. Those in these categories must obtain certificates that they were bona fide students before the armistice from the faculty of medicine concerned and must be of lower rank than surgeon sublieutenant. Application for certificates should be made to the Secretariat of State for War, Medical Corps Section, Royal, for the non-occupied zone, and to the Secretariat des Services de la Santé, 28 Avenue Friedland, Paris, for the occupied zone. Students of chemistry and physics were not included in the category. Relatives were reminded that the Germans were only considering the repatriation of these prisoners, but it would be as well to comply with the formalities required straightaway.

Aftonbladet, Stockholm, February 24, reports from Berlin that compulsory service has been introduced in the Ostland for doctors and nurses. Refusals to obey this order are punishable with imprisonment or fines.

CORRECTIONS

Sulfathiazole and Propylene Glycol.—In a communication to the editor entitled "Propylene Glycol a Menstruum for Sodium Sulfathiazole" in *THE JOURNAL*, April 11, page 1317, the word "sodium" in the title should have been omitted. Dr. Fredrick F. Yonkman, who with others signed the letter, writes that he hopes that no attempts may be made to dissolve sodium sulfathiazole instead of sulfathiazole in propylene glycol.

Dr. Luckhardt Not Chairman of Physiology Department.—A news item in *THE JOURNAL*, March 14, page 907, referred to Dr. Arno B. Luckhardt as professor and chairman of the department of physiology, University of Chicago, The School of Medicine. Dr. Luckhardt is professor of physiology and not chairman of the department. He is, however, chairman of the administrative committee of the department of physiology.

March 7, 1942.

Physicians Who Became Distinguished Politicians

The Right Honorable Sir Earle Page, minister representing the government of Australia in London, was a surgeon before he became an Australian statesman. In the presence of a distinguished audience, which included visitors from Australia and Canada, he was admitted to the honorary fellowship of the Royal College of Surgeons of England. At the ceremony the president of the college, Sir Alfred Webb-Johnson, said that the council decided to confer this distinction partly because of Page's services to surgery and partly because of the honor he had brought to the profession by his services as a statesman. From the time of Aristotle the hazardous path of politics had attracted many physicians. Several had achieved distinction, for, as sound treatment can be planned only after correct diagnosis, so can sound policy be formulated only in the light of knowledge of the facts. In the British Empire we may be proud of the record of many physicians who have followed a political career. Walter Foster, Christopher Addison, Auckland Geddes and Walter Elliot have held high ministerial office at home. Charles Tupper was prime minister of Canada, and Starr Jameson in South Africa. Godfrey Huggins is prime minister in Southern Rhodesia. In France that sturdy patriot Clemenceau, who today again might have "fired the soul of France," was a medical man, but so was Marat and so was the advocate of the humane killer, Dr. Guillotin.

Addressing Sir Earle Page, the president said "We recall that in the last war you gave splendid service in a busy casualty clearing station. In this war you are one of a team charged with the extirpation of the most dreadful scourge that has ever beset mankind, and for that scourge will be required the most radical excisional operation ever performed. For such a task it is fitting that you should be armed with what is regarded as the highest surgical diploma obtainable."

Replying, Sir Earle Page said that surgical training was most valuable for political life. "The most needed and least common thing in politics is diagnosis before treatment. Too often political treatment is empirical. A huge poultice is clapped on the cancer to hide it from the public instead of doing a complete excision."

The Empire Rheumatism Council

The fifth annual report of the Empire Rheumatism Council states that, though the war has delayed, it has not thwarted its plans. The large measure of attention it has won for a long neglected problem of public health and, in particular, the good progress last year is reason for reassurance. The publication early this year of "Rheumatism—A Plan for National Action" brought a notable awakening of public interest in the serious lack of facilities for effective treatment of rheumatic disease. The task is still to be faced of persuading the community, working through the appropriate authorities, to take action. Several favorable facts in regard to the provision of effective means of treatment are to be recorded. The Carnegie Dunferline Trust has approved of action taken in that town, and a bequest has been received toward the cost of a hospital or clinic in Aberdeen. The treatment centers in the United Kingdom continue their work, and the demand on their services shows how much they are valued. But the position still remains that only a small proportion of sufferers can obtain in the early stages the right diagnosis and the right treatment, which would save a great proportion from becoming disabled.

The Good Health of London

The report for 1940 of Dr. W. Allen Daley, medical officer and school medical officer for London, shows that in spite of the war the health of London has been good. The vast public health department continued not only to provide care and attention for the sick who applied to its hospitals but also carried on all its activities for the prevention of disease. No case of smallpox was notified during the year, and there has been none since June 1934. There was no epidemic of infectious disease. The number of cases of typhoid was only 3 per week. But the number of cases of cerebrospinal fever was increased in comparison with the previous year, 151 deaths against 34. The 1940 maternal mortality was 1.98 per thousand live births. The deaths from tuberculosis showed little variation from 1939, 3,005 against 2,952. However, the incidence in 1940 was greater than the figures indicate, because there has been a wartime reduction in the population of London in consequence of evacuation. The casualties from air raids did not reach the number anticipated, for which hospital preparation had been made.

CHILDREN STOOD THE AIR RAIDS WELL

The number of children of school age still in London at the beginning of 1940 was 180,000; at the end of the year, 85,000. All children about to leave school were examined so that their parents might be advised of any medical reason why certain employments would be unsuitable, and this is the first report to give information on the contraindications. Of 7,395 boys about to leave, 90 per cent were fit for any occupation; of 7,751 girls, 89 per cent. The biggest groups of contraindications were in work involving eyestrain (boys 4.44 per cent, girls 5.29) and in work requiring acute distant vision (boys 4.49 per cent, girls 4.98).

Thinner Books

The war has produced a great reduction in the supply of paper. Much of the raw material for making paper is imported, and shipping space is required for the more important munitions. Paper is rationed and medical journals have had their supplies reduced to half that of their prewar use. A book production war economy agreement has been voluntarily adopted by the publishers to cooperate in the economic use of materials. It is held to be a far better method than the imposing of restrictions by the government, which might be ill conceived and not based on correct knowledge of technical details. Never before in the history of books has it been necessary to regulate the format. It has been suggested that books should be standardized, but there is so much individuality in their making that this would be detrimental. Publishers have to work on a basic ration of paper. The result of the agreement is that books will be thinner and must conform to the typographic standards laid down and to the maximum paper specification. The public is asked to realize that, although the books are thin, they contain just as much reading matter and are just as costly to produce.

Status of Women Physicians in the Air Force

Under a new order from the Air Ministry, women medical and dental officers in the Women's Auxiliary Air Force are authorized to attend men as well as women. Previously their duties were confined to members of the Women's Auxiliary Air Force and they were employed only at the receiving and training centers of the force. The order also grants women equal status in seniority and rank as professional men in the air force. Most of the doctors and dentists of the Women's Auxiliary Air Force will be posted to stations where both men and women are employed, and for the first time women will have the opportunity of becoming station senior medical officers. Until now a distinction has been made between the duties of men and of women holding similar appointments.

PALESTINE

(From Our Regular Correspondent)

Feb 28, 1942

In Wartime

The war taught us economy. We can take as an example Kupat Holim, the workmen's sick fund of the General Federation of Jewish Labor in Palestine, an institution tendering medical aid to nearly 40 per cent of the Jewish population in the country, some two hundred thousand people. Although Kupat Holim put in stocks of medicaments sufficient for the needs of its members for one or two years, the directors were compelled to take strong measures for enforcing the maximum possible economy in the use of medical supplies. Detailed instructions were given for the use of medicaments and x-ray films. All three hundred and fifty physicians employed by Kupat Holim were placed under close supervision of a central control department. The medical staff appreciated the seriousness of the hour and saw that any excessive use of a vital medicine may in the future revenge itself both on the patient and on the physician, as supplies may be entirely exhausted. When prescribing a medicine or treatment, the physician has to take into account conditions two years hence. In this manner we have attained a standard where for each hundred visits only seventy-five prescriptions are written out by Kupat Holim physicians. The same applies to injections. The quantity of x-ray films dispensed monthly to the various x-ray institutes, whether in hospitals or in dispensaries, is calculated by the square centimeter of film. The economy in films was attained not so much by the reduction of diagnostic activities as through using fluoroscopy instead of photographs. An x-ray examination of the lungs, for instance, is carried out as follows. First a fluoroscopy is made, and if a suggestive shadow is discerned in any apex a small photograph is made of that apex. The use of tomographic photographs of the lungs has been confined to serious indications.

The question of insulin is serious. We have been compelled of late to forego the considerable advantages of protamine zinc insulin and revert again to plain insulin. An index of all members of Kupat Holim suffering from diabetes was compiled, with an indication of the number of units required by each patient. The supervising department was thus able to estimate the quantity of insulin required for the next two years and prepare sufficient stocks. It was sometimes necessary to order the insulin by air mail, so that it may be received fresh. The use of insulin for purposes other than diabetes was entirely dispensed with. Similar arrangements were made in connection with the use of liver preparations and serums.

Nurses and attendants were advised to economize. When the price of a thermometer goes up in the open market from 20 cents to \$2.50, strict economy is called for. It is easy to understand the anxiety with which one handles today the x-ray tube, the burner of the quartz lamp and similar apparatus. We have thus reached a stage where after two and a half years of war we are still in possession of sufficient stocks of most of the important medical supplies and instruments to cover our requirements for a lengthy period. There is, however, grave anxiety with regard to some products, especially after America's entry into the war.

The foregoing applies in the main to the institutions of Kupat Holim and the Hadassah Medical Organization. The rest of the population is in a much more difficult position.

PARTICIPATION IN THE WAR EFFORT

Contrary to the miserable condition in which the population of this country found itself in the last war, the present world conflagration found Palestine partly prepared owing to the numerous medical institutions erected such as the Hadassah Medical Organization, Kupat Holim, the Workmen's Sick Fund

of the General Federation of Jewish Labor in Palestine, Magen David Adom, a first aid society, and municipal hospitals and dispensaries in Tel-Aviv, Haifa and Tiberias. Another happy factor was the numerous physicians who during the cruel rule of the ruthless totalitarian régime in Europe, gathered here from the various European countries and found in Palestine a haven of peace. When the Jewish national institutions announced a general mobilization, the doctor and the nurse were the first to answer the call, their number attaining many hundreds. Many of these physicians left regular positions in medical institutions, eight from among the Kupat Holim doctors enlisted and their posts are being kept for them. All in all, eighty-five Jewish physicians have joined up and an additional number, three to five times as large, is still waiting to be called up. There are large reserves which could still be utilized.

The Jewish population has long since completed its first draft of ten thousand men and is now in the course of enlisting the second ten thousand soldiers, together with whom many physicians and nurses are ready and prepared to go wherever they are sent, to the desert, Russia, England and even the Far East. Recently the Women's Palestine Auxiliary Territorial Service was formed, and the required number of women as well as women physicians to serve with such units has already enlisted.

THE HADASSAH MEDICAL ORGANIZATION

A few months before the outbreak of war, Hadassah's long cherished ambition was realized, and the Hadassah University Medical Center in Jerusalem was opened. The center, which has the threefold aim of healing, teaching and research, is composed of the Rothschild Hadassah University Hospital, the Henrietta Szold Hadassah School of Nursing and the Nathan Ratnoff Building, which houses the medical school for post-graduate study and research of the Hebrew University. Within its spacious new quarters, equipped with the most up to date facilities, the hospital's services have been expanded and the standard of treatment raised to a high level. The hospital has over three hundred beds and can be enlarged to accommodate five hundred. Attached to it are x-ray, radium and pathologic institutes, bacteriologic, serologic, chemical and metabolism laboratories, an outpatient department and a hospital social service. To be in readiness for emergencies, the Rothschild Hadassah University Hospital has prepared two hundred reserve beds, and, with Hadassah's aid, the hospitals founded by it and now maintained by the local authorities in Tel-Aviv, Haifa and Tiberias were able to increase their hospitalization facilities for this purpose. In addition, a number of emergency hospitals were opened and equipped with Hadassah's assistance in various parts of the country. To alleviate the consequences of economic depression, free hospitalization for destitute patients from all parts of the country is provided in the Rothschild Hadassah University Hospital, a district medical service has been established in rural localities and a home medical service in towns, and the hospital social service was introduced in new localities.

Marriages

ARTHUR ALEXANDER KNAPP, Virginia Beach, Va. to Miss Florence Beverly Greene at Elizabeth City, N. C., February 3.

GEORGE G. GARRETT, Shreveport, La., to Miss Una Mary Andrus at Grove Hill, Ala. March 1.

MELVIN NEFTIK, Maryville, Tenn. to Miss Mary Ellen Fife of Knoxville, January 22.

DANIEL EDWARD BOWERS, Peoria, Ill., to Miss Virginia Rusk of Tremont recently.

DAVID H. LAWRENCE JR. to Miss Nelda Marlert both of Denver, January 17.

Deaths

James Joseph Walsh ☉ New York; University of Pennsylvania Department of Medicine, Philadelphia, 1895; an Affiliate Fellow of the American Medical Association; formerly dean and professor of nervous diseases and the history of medicine at the Fordham University School of Medicine; consulting physician, Sanatorium Gabriels, Gabriels, N. Y.; author of "Makers of Modern Medicine," "The Thirteenth Greatest of Centuries" (tenth edition published in 1937), "History of Medicine in New York" (published in five volumes), "Medieval Medicine," "Religion and Health" and many others; aged 76; died, February 28, of arteriosclerosis.

Charles Schultze Sample Jr., Passed Assistant Surgeon, United States Public Health Service, Mobile, Ala.; Washington University School of Medicine, St. Louis, 1932; entered the United States Public Health Service as an assistant surgeon Oct. 18, 1934; on the staff of the U. S. Marine Hospital; aged 37; died, March 8, in the U. S. Marine Hospital, Baltimore, of lobar pneumonia following an operation for the removal of a tumor.

Joseph R. Numbers Sr., Boise, Idaho; Eclectic Medical Institute, Cincinnati, 1885; member, past president and secretary of the Idaho State Medical Association; formerly member of the state examining board; fellow of the American College of Surgeons; at one time mayor of Weiser; on the staff of St. Alphonsus Hospital; aged 77; died, February 17.

Charles Knauss Reinke, Jamestown, N. D.; University of Pennsylvania School of Medicine, Philadelphia, 1917; member of the American Psychiatric Association and the New England Society of Psychiatry; served during World War I; aged 50; died, March 12, in the Hospital of the University of Pennsylvania, Philadelphia, of acute yellow atrophy of the liver.

Joseph Oswald Marien, Lewiston, Maine; University of Montreal Faculty of Medicine, Montreal, Que., Canada, 1924; member of the Maine Medical Association; at one time assistant superintendent of the Western Maine Sanatorium, Greenwood Mountain; on the staff of St. Mary's Hospital; aged 47; died, March 6, of glioma of the brain.

William Winn Hartwell, Malden, Mass.; Harvard Medical School, Boston, 1900; member of the Massachusetts Medical Society; served as city physician in Malden for several years and as medical examiner of the city board of health; on the staff of the Malden Hospital; aged 67; died, March 2, of coronary thrombosis.

William Benedict Evans ☉ Chester, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1912; fellow of the American College of Surgeons; served during World War I; aged 56; on the staff of the Fitzgerald Mercy Hospital, Darby, and the Chester Hospital, where he died, February 15.

John Hughes Galbraith ☉ Altoona, Pa.; University of Pittsburgh School of Medicine, 1912; fellow of the American College of Surgeons; served during World War I; orthopedic surgeon, Altoona General and Mercy hospitals; orthopedic consultant, Philipsburg State Hospital; aged 55; died, January 28.

William Napoleon Lynn ☉ Knoxville, Tenn.; Lincoln Memorial University Medical Department, Knoxville, 1909; served during World War I; aged 58; on the staffs of the Fort Sanders Hospital, Knoxville General Hospital and St. Mary's Memorial Hospital, where he died, February 2.

Carl Goldmark ☉ New York; Columbia University College of Physicians and Surgeons, New York, 1896; on the staff of the Lebanon Hospital; consulting physician to the Will Rogers Memorial Hospital, Saranac Lake, N. Y.; aged 66; died, February 19, of hypertension and cerebral hemorrhage.

Frederick Alexander Logan, Toronto, Ont., Canada; University of Toronto Faculty of Medicine, 1920; served during World War I; formerly assistant medical superintendent of the Toronto General Hospital; aged 47; died, February 7, in Niagara Falls of coronary occlusion.

Justin Herold, Scarsdale, N. Y.; Bellevue Hospital Medical College, New York, 1882; formerly professor of medical jurisprudence at the Fordham University School of Medicine, New York; for many years coroner's physician of New York County; aged 81; died, February 3.

H. Maxey Swift, Mount Vernon, Ill.; Physio-Medical College of Indiana, Indianapolis, 1895; member of the Illinois State Medical Society; formerly mayor and member of the state legislature; aged 71; died, February 15, of injuries received in an automobile accident.

John Calvin Hubenthal, Belmont, Wis.; Rush Medical College, Chicago, 1896; member of the State Medical Society of Wisconsin; past president of the Lafayette County Medical Society; formerly member of the county board of education; aged 73; died, January 18.

Charles Percy Charlton, Palmyra, Neb.; Chicago College of Medicine and Surgery, 1913; member of the Nebraska State Medical Association; served during World War I; associate staff member, Bryan Memorial Hospital, Lincoln; aged 55; died, February 18.

Alexander Carleton Potter ☉ Cambridge, Mass.; Harvard Medical School, Boston, 1899; served during World War I; president of the New England Society of Physical Medicine; aged 68; died, January 28, in the Massachusetts General Hospital, Boston.

Romeo Joseph Morin, Lewiston, Maine; Laval University Faculty of Medicine, Quebec, Que., Canada, 1916; member of the Maine Medical Association; served during World War I; on the staff of St. Mary's General Hospital; aged 50; died, February 3.

James Roberts Nankivell, Athens, Tenn.; University of the City of New York Medical Department, 1878; member of the Tennessee State Medical Association; served during World War I; aged 87; died, February 6, in the Forec Hospital of pneumonia.

William Emmett Wishart, Charlotte, N. C.; North Carolina Medical College, Charlotte, 1911; member of the Medical Society of the State of North Carolina; served during World War I; aged 55; died, March 2, of cerebral hemorrhage.

John Albert Martin, Indianapolis; Medical College of Indiana, Indianapolis, 1894; veteran of the Spanish-American War and World War I; aged 72; on the staff of the Methodist Hospital, where he died, February 19.

Herbert Jerome Matthews, Elliott, S. C.; Medical College of the State of South Carolina, Charleston, 1907; member of the South Carolina Medical Association; aged 57; died, February 17, in the Tuomey Hospital, Sumter.

George Tillerie Ross, Montreal, Que., Canada; McGill University Faculty of Medicine, Montreal, 1880; member of the American Laryngological, Rhinological and Otological Society; aged 91; died, January 25.

Frank J. Chalaron ☉ New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1892; veteran of the Spanish-American War; on the staff of the Mercy Hospital; aged 72; died in January.

Ernst Freund, Boston; Deutsche Universität Medizinische Fakultät, Prague, Austria, 1900; member of the Massachusetts Medical Society; author of a book entitled "Diseases of the Joints"; aged 65; died, February 19.

James Benjamin Wallace, Providence, Ky.; Hospital College of Medicine, Louisville, 1905; member of the Kentucky State Medical Association; member of the county board of health; aged 75; died, January 31.

James Eldred Miller ☉ Huntsville, Ala.; Memphis (Tenn.) Hospital Medical College, 1911; past president of the Madison County Medical Society; on the staff of the Huntsville Hospital; aged 59; died, February 27.

Leonard Dominic Marinaro, Sharon, Pa.; Georgetown University School of Medicine, Washington, D. C., 1926; member of the Medical Society of the State of Pennsylvania; aged 42; died, February 10.

Isaiah Snyder Morris, Detroit; University of Michigan Homeopathic Medical School, Ann Arbor, 1886; served during World War I; aged 77; died, February 15, in the Mount Carmel Mercy Hospital.

George Lawrence Nicholas, New City, N. Y.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1887; also a clergyman; aged 77; died, February 17.

James E. Nelson, Lodi, Calif.; University of Missouri School of Medicine, Columbia, 1905; member of the California Medical Association; aged 62; died, January 5, in a hospital at Merced.

William Gillmore Booth, Seattle; Baltimore Medical College, 1898; member of the Washington State Medical Association; aged 81; died, February 6, of chronic myocarditis and pneumonia.

Joseph William Allen Goodman, Miss.; Memphis (Tenn.) Hospital Medical College, 1894; Marion-Sims College of Medicine, St. Louis, 1896; aged 71; died, February 4, in Jackson.

Armistead Montgomery Fredlock, Elkins, W. Va.; University of Maryland School of Medicine, Baltimore, 1889; for many years mayor; health officer; aged 75; died, February 15.

Willard Anthony Thompson & **Dixon**, Ill.; Hahnemann Medical College and Hospital, Chicago, 1910; served during World War I; aged 59; died, March 1, of coronary thrombosis.

Walter Scott Lucas, Ventnor, N. J.; Jefferson Medical College of Philadelphia, 1910; member of the Medical Society of the State of Pennsylvania; aged 69; died, February 12.

Guy Leslie Herman, Socorro, N. M.; University of Tennessee College of Medicine, Memphis, 1912; member of the New Mexico Medical Society; aged 54; died, January 25.

William Wilmerding Moir & **Minneapolis**; University of Minnesota College of Medicine and Surgery, Minneapolis, 1906; aged 60; died, February 3, of a self-inflicted bullet wound.

Edward F. Hanlon, Hazleton, Pa.; Jefferson Medical College of Philadelphia, 1908; member of the Medical Society of the State of Pennsylvania; aged 69; died, February 23.

Martin Joseph Larkin, Philadelphia; Eclectic Medical College, Cincinnati, 1913; member of the Medical Society of the State of Pennsylvania; aged 70; died, February 9.

Goodall Harrison Wooten, Austin, Texas; College of Physicians and Surgeons, medical department of Columbia College, New York, 1895; aged 72; died, January 30.

Thomas Andrew McGrath, Hoosick Falls, N. Y.; Albany Medical College, 1909; served during World War I; formerly county coroner; aged 54; died, February 10.

Robert A. Pogue, Covington, Va.; Meharry Medical College, Nashville, Tenn., 1918; aged 56; died, January 10, in the Chesapeake and Ohio Hospital, Clifton Forge.

Abe Bethel Penn, Alexandria, Va.; Howard University College of Medicine, Washington, D. C., 1902; aged 64; died, January 15, at his home in Washington, D. C.

John Medicus Cullum, Nashville, Tenn.; University of Nashville Medical Department, 1905; formerly member of the board of education; aged 71; died, February 17.

Marion U. Thomas, Weeping Water, Neb.; University Medical College of Kansas City, Mo., 1897; aged 76; died in February at Lincoln of coronary thrombosis.

Albert Schupmann, Chicago; Homeopathic Medical College of Missouri, St. Louis, 1897; member of the Illinois State Medical Society; aged 79; died, January 25.

Cary S. McCafferty, Columbus, Ohio; Columbus Medical College, 1890; member of the Ohio State Medical Association; aged 73; died, February 7, of heart disease.

Samuel Edward Lynch, Olyphant, Pa.; Jefferson Medical College of Philadelphia, 1887; formerly superintendent of the Blakely Home; aged 80; died, January 25.

Frank S. Hargrave, Orange, N. J.; Leonard Medical School, Raleigh, N. C., 1901; for many years member of the state legislature; aged 68; died, March 11.

Ettore Tresca & **New York**; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1892; aged 74; died, January 15, in the Park West Hospital.

W. Johnson Strother, Culpeper, Va.; Medical College of Virginia, Richmond, 1871; member of the Medical Society of Virginia; aged 92; died, February 15.

George Mathes, Kiel, Wis.; Chicago Homeopathic Medical College, 1904; for many years health officer; aged 69; died, February 19, of military tuberculosis.

Jesse A. Clifton, Beaufort, S. C.; Medical College of the State of South Carolina, Charleston, 1896; aged 68; died, January 6, in a hospital at Walterboro.

Leslie Bryce Stockslager, Lewiston, Idaho; Barnes Medical College, St. Louis, 1908; aged 57; died, February 17, in Clarkston, Wash., of heart disease.

Charles Francis McNevin & **St. Paul**; Northwestern University Medical School, Chicago, 1908; aged 64; died, February 16, in St. Joseph's Hospital.

Cranz Nichols & **Maxwell**, Texas; University of Texas School of Medicine, Galveston, 1913; served during World War I; aged 53; died, January 6.

Ralph Waldo Emerson Bledsoe, Los Angeles; Meharry Medical College, Nashville, Tenn., 1915; served during World War I; aged 46; died, January 25.

Walter Raleigh Breeding, Marysville, Kan.; Rush Medical College, Chicago, 1892; member of the Kansas Medical Society; aged 77; died, January 9.

Giovanni Castaldi, Providence, R. I.; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1923; aged 42; died, Dec. 12, 1941, in Boston.

William Laban Moore, St. Louis; Barnes Medical College, St. Louis, 1899 and 1907; aged 67; died in February at the Missouri Baptist Hospital.

Theodore A. Nichols, Mission San Jose, Calif.; University of California Medical Department, San Francisco, 1885; aged 80; died, January 16.

James Robert George, Fredonia, Texas; University of Tennessee Medical Department, Nashville, 1897; aged 67; died, February 4, of endocarditis.

Thomas Lucius Shaffner, Los Angeles; University of Southern California College of Medicine, Los Angeles, 1889; aged 79; died, January 3.

Iva Seal Thompson, Philadelphia; Woman's Medical College of Pennsylvania, Philadelphia, 1902; died, February 17, in the Woman's Hospital.

Leo Francis Driscoll, Brookline, Mass.; Georgetown University School of Medicine, Washington, D. C., 1929; aged 40; died, Dec. 20, 1941.

Mark Clyde Jones, Joliet, Ill.; Marion-Sims College of Medicine, St. Louis, 1898; served during World War I; aged 70; died, February 10.

David Leslie Lowry, Teague, Texas; Medical Department of Tulane University of Louisiana, New Orleans, 1906; aged 62; died, February 7.

Mahlon William Loeke, Williamsburg, Ont., Canada; Queen's University Faculty of Medicine, Kingston, 1905; aged 61; died, February 7.

Joseph Stevenson, Louisville, Ky.; Southwestern Homeopathic Medical College and Hospital, Louisville, 1901; aged 81; died, January 28.

George Jordan Mehler & **Lynbrook**, N. Y.; University and Bellevue Hospital Medical College, New York, 1924; aged 40; died, February 1.

J. Walter Carryer, Columbia, Mo.; Cincinnati College of Medicine and Surgery, 1878; aged 87; died, February 9, of chronic bronchitis.

Lewis Alfred Querner, Toledo, Ohio; Medical College of Ohio, Cincinnati, 1909; served during World War I; aged 54; died, January 31.

Alexander Leslie Marshall & **Harrisburg**, Pa.; Medico-Chirurgical College of Philadelphia, 1910; aged 52; died, February 2.

Edwin H. Jones, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1889; aged 79; died, January 21.

Berry W. Fite & **Resaca**, Ga.; Southern Medical College, Atlanta, 1887; aged 79; died, January 13, of coronary occlusion.

William Lewis Elmore, Frankfort, Ky.; College of Physicians and Surgeons, Baltimore, 1883; aged 85; died, January 11.

Paul Louis Gailmard, Ekalaka, Mont.; Emory University School of Medicine, Atlanta, 1926; aged 39; died, January 13.

William Ivanhoe Kinsley, San Diego, Calif.; Bennett Medical College, Chicago, 1909; aged 63; died, January 27.

John McAllister, New York; Albany Medical College, 1879; aged 90; died, February 6, at his home in Scarsdale.

John Francis Oslin, Providence, R. I.; Tufts College Medical School, Boston, 1920; aged 46; died, February 7.

Thomas F. Brady, Detroit; Detroit College of Medicine, 1903; aged 63; died, January 31, of coronary thrombosis.

Rolla Beatty Fore, Blanchard, Pa.; Baltimore University School of Medicine, 1898; aged 64; died, February 21.

Charles H. Hodson, Vacaville, Calif.; Eclectic Medical Institute, Cincinnati, 1881; aged 85; died, January 14.

William Joseph Sullivan, Baltimore; Maryland Medical College, Baltimore, 1901; aged 71; died, January 30.

Bureau of Investigation

SCIENTIFIC (SIC) MANUFACTURING COMPANY, INC.

Actions of Various Federal Agencies Against the Concern and Its President, Howard J. Force

From Scranton, Pa., the Scientific Manufacturing Company, Inc., with a Howard J. Force as president, sold through the mails a nostrum called "Dialin." It was promoted as a remedy for diabetes with the promises "New achievement, DIALIN, reduced sugar and thirst. Widely used . . . Modified diet. No needle." Such claims, of course, implied that a diabetic patient could give up insulin and substitute Dialin. Those who answered the advertisement received extensive literature including testimonials from lay users as well as from osteopaths, chiropractors, and one doctor of medicine. According to the directions one was to take a teaspoon of the preparation in a little water after meals. Also when the sugar had been reduced to normal the dose was to be cut down one half for about four weeks. Then too there were furnished "suggestions to those using Dialin." These were to the general effect that aluminum and aluminum baking powder should not be used; that brown sugar, molasses, honey, cracked wheat or whole wheat bread should be taken and saccharin and pasteurized milk should be avoided. The purchaser was advised to eat the things that he knew would agree with him, but nothing was said to help one determine which foods would agree with him.

As the scheme appeared to the Post Office Department to be a means of obtaining money through the mails on false and fraudulent pretenses, representations and promises, that agency on Feb. 17, 1941 ordered the promoters to show cause on March 13 why their business should not be debarred from the mails. After several postponements the hearing took place on April 30 and H. J. Force appeared with his attorney. At the hearing it was brought out that Dialin had been offered to the public under the representations that when used as directed it would quickly overcome and relieve the "weak and tired feeling" and "that great thirst" common to the diabetic; that Dialin, when used as directed by any person in the advanced stages of diabetes, would completely normalize or materially reduce the sugar content of both blood and urine, remove the cause of diabetes and cure this condition, besides being an effective substitute and eliminating the necessity for insulin injections.

The defendants' answer denied these charges and alleged in substance that all their claims for Dialin were true and correct and that they had not knowingly misrepresented it in any way but had attempted to make clear to all prospective purchasers that the thing was not a cure for diabetes. H. J. Force testified that he had developed Dialin and had experimented with it for about two years before placing it on the market in 1936. The reason for its development, he said, was the necessity for providing a friend, who was diabetic and refused to take insulin, with a preparation which would help her control her condition. Force admitted that except for his training obtained in the New Jersey College of Pharmacy and his subsequent practical experience in the field of chemistry he had no specialized knowledge of medicine.

A qualified chemist who appeared for the government at the hearing testified that his analysis of Dialin showed that each teaspoon of it contained 2.16 grains of magnesium carbonate, 3.48 grains of sodium bicarbonate, 14.9 grains of glycerin, 3.372 grains of plant material including rhubarb and ipecac, 0.32 grain of peppermint, 0.925 grain of alkaloids, 0.01 grain of iron, a small amount of alcohol and traces of phosphate, citrate and calcium. Substantially the same information appeared on the Dialin label.

Another government witness was a physician who specializes in the treatment of diabetes and lectures on that subject in a leading medical school. His testimony covered the causes and symptoms of this disease and outlined its scientific treatment. From this standpoint he showed that the use of a "patent medicine" like Dialin is utterly discredited as a treatment for diabetes. Force attempted to refute the physician's testimony

by presenting that of a lay user of Dialin and testimonial letters of a doctor of medicine and several osteopaths and chiropractors. These testimonials, however, failed to state the dietary restrictions observed by the respective patient at the time that Dialin was being used or else did state that the patient had observed a certain prescribed diet.

As Force was unable to disprove the charges brought against him, the Post Office on Aug. 16, 1941 issued a fraud order debarring the Scientific Manufacturing Company, H. J. Force, president, and their officers and agents from the mails. Force, however, like some other promoters of mail order medical fakes, did not discontinue his scheme but simply changed its trade style, operating under the name Howard Force and continuing to send out literature similar to that revealed by the government's earlier investigation. He advised his correspondents that the product would be shipped by Howard Force by express and that the purchaser should not remit by postoffice money order in payment but should send cash, express order or check. When the Post Office discovered this evasion it issued a supplementary fraud order against the name of Howard Force under date of Oct. 10, 1941.

Incidentally, two additional government agencies have taken action against Force or the concern with which he is connected. In March 1933 the Food and Drug Administration seized a consignment of "Menno" that had been shipped in interstate commerce by the Scientific Manufacturing Company, Inc., and charged that the label bore false and fraudulent claims as to its curative effect on indigestion, "gas condition" and ptomaine poisoning, among other things. Government chemists reported that it consisted essentially of plant drugs including a laxative with glycerin, alcohol and water, small amounts of sodium and magnesium carbonates and a trace of ipecac alkaloids. As the company neither put up a defense nor claimed the property, the latter was confiscated.

Similar charges were made against another interstate consignment of Menno shipped around the same time with a quantity of "Pheno-Isolin," another of the concern's products. The government charged that the labels of Pheno-Isolin bore false and fraudulent representations, such as that it is effective to prevent and destroy infection and to act as a local antitoxin. According to a government chemist, Pheno-Isolin was found to be nothing more wonderful than a mixture consisting essentially of turpentine, camphor, menthol and resin dissolved in an oil and would require many hours of contact with bacteria before exerting any germicidal action. Tests also showed that it was not an antitoxin. In this case, tried in a district federal court, the defendants entered pleas of *nolo contendere* and the court imposed a fine of \$30.

Another seizure of a shipment of Pheno-Isolin in interstate commerce was made in August 1933 on charges similar to those already mentioned, and since the Scientific Manufacturing Company, Inc., made no reply in this case the consignment was confiscated by the court.

On April 30, 1938 another government agency, the Federal Trade Commission, announced that as the result of a complaint that it had brought against the Scientific Manufacturing Company, Inc., that concern had signed a stipulation in which it promised the Commission to discontinue on its labels or in its advertising matter misrepresentations to the effect that Pheno-Isolin possesses antitoxic properties or acts as a "sure" germicide when used in connection with the treatment of certain maladies or that, when used as directed, the product destroys infection, dissolves all kinds of bacteria or does a few other things.

In April 1941 the Commission took further action against the Scientific Manufacturing Company, Inc., and Howard J. Force by issuing a complaint against them for representing that "Pheno-Isolin" and "Pheno-Isolin Ointment" constitute competent antiseptics and germicides and possess substantial therapeutic value in treating skin infections generally. Some twenty specific ailments or conditions, including ulcers, carbuncles, abscesses, diphtheria and influenza, were mentioned as disorders for which the products in question were excessively recommended. At the same time the Commission also charged the respondents with representing that their Dialin constitutes a remedy and effective treatment for diabetes and benefits a

diabetic person in various specific ways. The complaint further was directed against testimonials in the advertising matter which were alleged to have been written by physicians. According to the complaint, the respondents' preparations are not used or recommended by the medical profession generally. Shortly afterward Force and his concern replied with a general denial of the charges, and it appears that the case has not yet been concluded.

On Feb. 1, 1941 the Commission reported that it had ordered the Scientific Manufacturing Company, Inc, and its president, Howard J. Force, to discontinue misrepresentations contained in the pamphlets entitled "Poisons Formed by Aluminum Cooking Utensils" and "Are You Heading for 'The Last Round-Up'?" These were to the effect that food prepared or stored in aluminum utensils is unsafe, deleterious, disease producing, poisonous or otherwise dangerous to the health. Subsequently, however, according to *Editor and Publisher* for Jan. 17, 1942, the United States Circuit Court set aside the Cease and Desist order, ruling that, since the Scientific Manufacturing Company and H. J. Force do not make cooking utensils of nonaluminum material and hence no competition exists between them and manufacturers of aluminum cooking utensils, the antialuminum pamphlets mentioned merely represent statements of opinion rather than unfair trade practice.

Howard J. Force has long been one of those who have promoted the preposterous propaganda against aluminum cooking utensils. He has cited as sponsors of his cause a list of alleged physicians. When their names were looked up it was found that few of them were doctors of medicine; many were already in the Bureau of Investigation's quackery files for other professional irregularities. Additional representatives of the anti-aluminum following are reported to have given testimonials for Pheno-Isolin, including Charles T. Betts of Toledo, an early leader in the movement, the questionable Koch Laboratories of Detroit, promoters of a "cancer cure," and the utterly quackish Baker cancer outfit. The latter, once at Muscatine, Iowa, but in its final days at Eureka Springs, Ark., seems to have closed up shop since the government sent its promoter, Norman Baker, to prison in 1941 for conducting a mail order fraud.

SOME MISCELLANEOUS MEDICAL FRAUDS

A Variety of Schemes Debarred from the Mails

Fraud orders issued by the Post Office Department have frequently been the subject of extensive articles by the Bureau of Investigation in these pages of *THE JOURNAL*. Following are brief abstracts of some fraud orders not dealt with previously.

Esselstein's "Cancer Cure."—From Spokane, Wash., one W. C. Esselstein, using "N.D." after his name, put out a treatment that he variously called "W. C. Esselstein's Internal Cancer Formula Soluble Organic Food" and "Esselstein's American Herb Formula." The Post Office investigation disclosed that he advertised it through the mails by means of small cards that recommended it "for treating all internal and external cancers, fibroid tumors, stomach ulcers, arthritis and abdominal diseases" and that he represented that it had cured him of an internal cancer and would do as much for others. In one of his follow up letters to an inquirer, it was reported, he claimed that it would restore users to "health even after they were considered beyond medical aid," and that it could safely be used by any one. With the treatment went certain dietary instructions and a warning against the use of aluminum cooking utensils. According to the Post Office memorandum on the case, Esselstein claimed that his nostrum consisted of cascara bark, senna leaves, water pepper, yerba santa, American saffron, bloodroot and water, with sodium benzoate as a preservative, and this composition was indented by the government chemists' analysis. An expert medical witness testified that neither this mixture nor any other would check or eliminate cancerous growths in the body and that, in fact, Esselstein's nostrum, by its irritating effect, might aggravate cancerous conditions and also cause the rupturing of a diseased appendix. The Post Office's findings, therefore, were that Esselstein's scheme amounted to obtaining money through the mails by means of fraudulent pretenses, representations and promises, and a fraud order was accordingly issued on Oct. 15, 1940 debarring it from the mails.

Magie Oil Company and Carl G. Schnepel—"Magic Oil Liniment" also known as "Carl's Magic Oil Liniment" was the product that Carl G. Schnepel, operating from Colorado Springs as the Magie Oil Company, sold through the mails. According to the Post Office memorandum on this case he promoted the product under the false and fraudulent representations that his product would effectively overcome rheumatism, neuritis and arthritis, cure athlete's foot, remove eczema and eradicate colds, sore throat, hay fever and asthma. According to the memorandum, the busi-

ness was started in Omaha in 1933 and after moving to several other places it was established in Colorado Springs in September 1940. Testimonials, of course, were played up in the advertising. When an investigator for the Post Office questioned Mr. Schnepel as to the composition of his liniment, he replied that it contained oils of wintergreen, mustard and eucalyptus, as well as camphor, turpentine, menthol, salicylic acid and acetone. A government chemist found all of these except acetone present in the product. Although Schnepel sent eleven separate communications to the Post Office, in general denying the allegations of fraud, he neither put in an appearance at the hearing on Dec. 20, 1940 nor sent a representative. At this hearing an expert medical witness for the government testified that a mixture such as this liniment is essentially a counterirritant and produces its effects by irritation of the outer layers of the skin. Hence it might offer temporary palliation for the aches and pains incident to some types of arthritis and rheumatism but, as the witness pointed out, "the presence of foci of infection in the body, venereal diseases and other factors are often involved in the onset of rheumatism and arthritis." The findings at the hearing were that the sale of this liniment constituted a scheme for obtaining money through the mails by means of false and fraudulent pretenses, representations and promises, and on Jan. 7, 1941 a fraud order was issued against various forms of the names of Carl G. Schnepel and the Magie Oil Company.

Relivo Products Company.—Under this trade style one Joseph R. Jafferis of Indianapolis sold through the mails three products called "Relivo Salts," "Nervilo" and "Urilavo." The first named was sold under representations that when used as directed it would cure rheumatism, neuritis, gout, lumbago, neuralgia and arthritis and overcome all pains and aches resulting therefrom, besides having no bad effects on the user. A government chemist testified that each tablet of this nostrum (12.5 grains) contained 4.2 grains of acetophenetidin, 4.2 grains of acetylsalicylic acid and 0.33 grain of phenolphthalein. Nervilo Tablets, according to the advertising, were supposed "to represent a balanced formula for the treatment of the nerves," to overcome nervousness, "jitters" and sleeplessness and were represented as a safe and dependable nerve tonic. The chemist testified that each tablet contained 0.3 gram of phenobarbital, a trace of mydrinate alkaloid and, for the rest, mostly powdered kaolin and a small amount of powdered okra. Urilavo was represented to overcome and prevent gallstones and correct the cruse of biliousness, congested liver and dyspepsia and restore a free flow of bile and proper intestinal and gastric digestion. The same chemist reported that this nostrum contained small amounts of emodin, bile salts, calcium chloride and phenolphthalein. The Post Office found that the sale of these nostrums constituted a scheme for obtaining money through the mails under false and fraudulent pretenses and on Oct. 16, 1940 debarred the Relivo Products Company from further use of the mails.

T. J. Hutton, M.D.—On July 25, 1940 the Post Office Department served notice on T. J. Hutton, M.D., of Powers, Mich., to show cause, at a hearing to be held on September 3, why a fraud order should not be issued against him for soliciting remittances of money through the mails for an alleged treatment for tuberculosis. According to the Post Office memorandum Dr. Hutton disparaged the use of surgery and claimed that his treatment was significantly different from and more effective than any methods regularly prescribed by tuberculosis specialists, that it would cure, within one year, practically all cases of tuberculosis including those in the advanced stages; that various medicines he furnished were valuable and effective adjuncts to measures regularly used for tuberculosis and were necessary for the cure of that disease and that by means of information supplied by customers to whom he sent blanks he could correctly diagnose and properly prescribe for all persons suffering from tuberculosis without personally examining them. The memorandum went on to show that Dr. Hutton started this business in 1912 and advertised it in various publications, following up inquiries with form letters. Hutton neither appeared at the government hearing nor sent a representative. A chemist and a microscopist in the employment of the government testified to finding the following composition in Hutton's medicines:

Red Pills In each, essentially 2 grains of creosote, 0.83 gram of acid insoluble material, probably tale, 0.18 gram of iron and about 2 grains of calcium, coating and color.

White Powder (in paper box) Essentially potassium chloride.

Second White Powder Found on microscopical examination to contain finely ground bone (including some calcium carbonate), also material closely resembling precipitated calcium phosphate.

Granular White Powder. Essentially sodium chloride and moisture.

Colorless Liquid Essentially an aqueous solution containing 0.94 per cent of solid material, mostly sodium chloride and about 0.08 per cent of phenol.

Second Colorless Liquid An aqueous solution containing 2.22 per cent of solid material, mostly sodium chloride and about 0.09 per cent of phenol.

These products were to be taken internally, some to be sprinkled on the food, others to be consumed in doses before meals and the liquids to be injected under the skin by means of a hypodermic needle. An expert medical witness testified for the government on the different forms of tuberculosis and the scientific treatment thereof and showed that under Hutton's method the patient was deprived not only of a physician's personal examination and care but also of any opportunity for surgical measures, both of which, the expert witness pointed out, are essential to successful treatment of many cases of tuberculosis. He also brought out that the chart supplied by Dr. Hutton to his mail-order "patients" is not a correct guide to follow for proper diagnosis and treatment, nor would the combination of the Hutton medicines constitute a scientific treatment for tuberculosis. Accordingly, the Post Office Department on Sept. 21, 1940 debarred Hutton's scheme a fraud and debarred it from the mails.

Correspondence

SURGERY FOR CANCER OF
THE PROSTATE

To the Editor:—In *THE JOURNAL*, March 7, page 855, there is a statement with regard to cancer of the prostate. In the first paragraph of the reply to the question it is stated that:

It is the opinion among urologists that once the diagnosis of carcinoma of the prostate has been made it is technically impossible to do any sort of surgical procedure that would effect a cure. Once the diagnosis of carcinoma of the prostate has been definitely made, the condition is no longer surgical.

Undoubtedly the opinion that is expressed is held by a large proportion of urologists, chiefly those who have never done a perineal prostatectomy. A small but steadily increasing number have become convinced of the soundness of Hugh Young's teachings concerning the value of total perineal prostatectomy for selected cases of early prostatic cancer. Frank Hinman, Alexander Randall and Roy Henline are among the men who believe this operation worth while.

This is not the occasion for a lengthy review of the results obtained by various operators. It may be enough to point out that 1 of Young's patients lived twenty-five years after operation without evidence of recurrence and that of 38 patients with favorable prognosis 50 per cent lived five years or more after operation without evidence of recurrence or metastasis.

"One patient died less than five years after operation of another disease. A careful autopsy showed no recurrence or metastases." (Young H. H.: *Surg., Gynec. & Obst.* 64:472 [Feb.] 1937).

In my own series of around 80 patients, there are 2 alive and well thirteen years after operation, and at least 25 are living from one to twelve years after prostatectomy. The prostate of the last patient operated on, carefully sectioned after its removal, proved to contain but one focus of adenocarcinoma. This nodule was 1 cm. in diameter but, as is usually the case, it was situated close to the periphery of the gland and could easily be detected on rectal palpation. As proof of the fact that no superhuman diagnostic acumen is required for the recognition of these cases, let me say that a considerable proportion of the early cases have been referred to me by internists who have discovered suggestive prostatic nodules on routine rectal examination.

There is no certainty of obtaining a cure in any case of cancer, no matter what organ is involved. The percentage of probable cures achieved by total prostatectomy in my own series is around 25 per cent, but with the newer methods of treating prostatic cancer it seems reasonable to expect that, even if the growth develops elsewhere, from metastases which had taken place before operation, it may be controlled by castration and the administration of diethylstilbestrol.

The statement says "Once the diagnosis of carcinoma of the prostate is definitely made, the condition is no longer surgical." The diagnosis of any cancer can be made "definitely" only by microscopic examination of the tissue. Even this criterion can be fulfilled, in the case of prostatic cancer, by a biopsy of the suspected area after the prostate has been exposed by a perineal approach. This is done frequently in cases of early involvement, and if the report is positive total prostatectomy is then performed.

The fact that there are not many urologists well enough trained in the perineal approach to perform total prostatectomy does not justify the statement that the operation cannot be done. I regret to say that *THE JOURNAL* is misinformed with regard to the treatment of early cancer of the prostate.

GEORGE GILBERT SMITH, M.D., Brookline Mass.

LOCAL USE OF SULFONAMIDE
COMPOUNDS

To the Editor:—The article by Dr. Frederic W. Taylor on the misuse of sulfonamide compounds, which appears in the March 21 issue of *THE JOURNAL*, paints a discouraging picture with regard to the local use of these drugs. Although his experimental observations are no doubt true, from a practical point of view and experience with the clinical use of these drugs, the advantages of their local use, it seems to me, far outweigh the disadvantages. I have recently been interested in the use of sulfathiazole prepared in the microcrystalline form. The details of the preparation will be reported elsewhere. I wish to state here, however, that the crystals are of uniform size and are extremely small. The advantage of this type of preparation is the fact that a considerably greater surface exposure is permitted so that the drug, although no more soluble, goes into solution more readily.

When the material is applied with an insufflator into fresh traumatic wounds or operative wounds in which infection might be expected, as for instance in closure of a colostomy, the wounds heal without any apparent inflammatory reaction. Although Dr. Taylor has reported the finding of abscesses around sulfathiazole crystals in wounds my experience has been exactly the reverse. The wounds heal primarily without serum or inflammatory reaction, and I have not had 1 single case in which there was any evidence of the formation of an abscess. As a matter of fact, the results that I have obtained in cases in which wounds were closed and in which a definite infection was to be expected were remarkable. I now feel so confident about the use of this drug that I have closed numerous colostomies without drainage and have had no instance of infection developing.

As to the use of the sulfonamide drugs in the abdomen, I have had an interesting experience, both clinically and experimentally, concerning this question. There is no doubt that the application of a powdered drug, especially the powdered insoluble drugs such as sulfathiazole or sulfadiazine, does produce a local conglomeration of the drug with some peritoneal reaction and a foreign body type of reaction. The microcrystalline preparation can be suspended in saline solution in a strength of 10 or 20 per cent. This forms a material much like magma magnesiae, which remains in suspension and which can be injected through a syringe. When introduced into the abdomen there is general spreading of the drug throughout the abdominal cavity, and I have not found a single instance of any evidence of a peritoneal irritation when the abdomen in experimental animals was examined five to seven days after the implantation of the drug. In clinical usage also the drug has proved to be extremely valuable, and there has been no evidence of any peritoneal irritation, although I have not had an opportunity to examine an abdomen after the use of the drug.

I agree with Dr. Taylor in his suggestion that the use of the sulfonamides locally is unnecessary in routine incisions which are made for clean operations. On the other hand, I am of the opinion that the local use of these drugs, especially the microsulfathiazole preparation, in contaminated wounds and in traumatic lesions offers the maximum of protection against infection. Sulfathiazole is of more value than sulfanilamide in this respect in that it remains in the wound for a longer period and so exerts a longer action (three to four days). Furthermore, its effectiveness seems to be greater against a wider range of organisms than does the more soluble sulfanilamide.

L. KRAEER FERGUSON, M.D., Philadelphia.

MEDICOLEGAL ABSTRACTS

Hospitals: Interns Are Not "Students."—The petitioner, and others on whose behalf he sued having completed a medical course and received a degree from an accredited medical school, was serving an internship in a New York hospital supported wholly or partly at public expense. Section 150 of the Election Law of the state provides, among other things, that an eligible voter must have been an inhabitant of the state for the preceding year, a resident of the county for four months and a resident of the election district for thirty days. Section 151 provides that "for the purpose of registering and voting no person shall be deemed to have gained or lost a residence . . . while a student of any seminary of learning, nor while being kept at any almshouse, or other asylum, or institution wholly or partly supported at public expense or by charity. . . ." Contending, in effect, that the petitioner was either a "student" or a "kept" person within the meaning of section 151 and hence, apparently, not a resident of the county in which the internship was being served, the commissioners of election of the county of Monroe refused to accept his registration as a voter. Accordingly the petitioner, on behalf of himself and all others similarly situated, applied to the supreme court, Monroe County, New York, for an order directing the commissioners to accept the registration of himself and of the others.

The supreme court said that there is a difference between "students" and "interns." The medical practice act, it was pointed out, defines students as persons who are "matriculated and enrolled in medical school," although they are permitted to perform some functions in hospitals. An intern, on the other hand, has already completed his medical course and is serving on the resident staff of the hospital. The petitioner, as an intern, received no wages but he did receive room, board and maintenance and was on day and night call at the hospital. That was far different, said the court, from the freedom normally associated with student life. The supreme court also held that the petitioner was not "kept" within the meaning of the law. He was not a beneficiary of the charity of a publicly supported hospital but was working for the hospital under a written contract. The court therefore ordered the commissioners and inspectors of elections to register the petitioner and others on compliance with the statutory requirements of the election law.—*Rathbun v Smith*, 23 N Y S. (2d) 95 (N Y, 1940)

Charitable Hospitals: Liability for Tort Conditioned on Liability for Taxation.—While the plaintiff was a pay patient in the defendant hospital, a charitable institution, she received injuries due to the alleged negligence of the defendant's servants in applying a hot pad. In a subsequent suit against the hospital, the plaintiff recovered a judgment in the trial court. This judgment was affirmed by the court of appeals with the modification that none of the defendant's property which was held in trust and was being used for charitable purposes might be subjected to satisfaction of the judgment. From this judgment the defendant appealed to the Supreme Court of Tennessee.

The evidence disclosed that the defendant corporation owned, in addition to the hospital plant and equipment, a nurses' training school, a large office building, a retail drug store, an interest in a surgical supply house, and a farm valued at \$200,000. The total income derived by the hospital from these properties exceeded \$230,000 annually. The hospital itself received both charity and pay patients, and other buildings on the hospital premises afforded hotel accommodations, including room and meals, to friends and relatives of patients. The defendant contended, in effect, that it was immune from tort liability because of its charitable nature, that all of its income from whatever source, was devoted to hospital purposes—was property held in trust for the benefit of a charitable institution—and that therefore none of its property was subject to levy.

in satisfaction of the judgment. The Supreme Court held that, according to the Tennessee law, a judgment could be rendered against a charitable institution when it appeared that satisfaction therefor could be had without encroaching on property devoted strictly to trust purposes. Furthermore, that the immunity of such property depended on its direct and exclusive use in the operation of the trust. The court noted an analogy between the exemption of a charitable institution from taxation and its immunity from liability for tort. In 1935 the legislature redefined the tax exemption of charitable organizations by providing that they were exempt from taxation only to the extent that their property was used exclusively for charitable purposes. The court said that a similar rule should be applicable to a case of this nature and that property exempt from tax liability should also be exempt from tort liability. Since it was clear to the Supreme Court in this case that the defendant did own property of great value which was subject to taxation, it was evident that a judgment could be satisfied out of that property without resorting to, or impairing, trust assets. The judgment for the plaintiff was accordingly affirmed—*Baptist Memorial Hospital v. Coullens*, 140 S. W. (2d) 1088 (Tenn., 1940).

Insanity: Liability of Physician for Certifying to Insanity When Appointed by Court.—In this case, a county court commissioner, in accordance with procedure authorized by statute, appointed two physicians to examine the plaintiff and report to the court as to her mental condition. The physicians found her insane and so reported to the court. On the strength of that report, the plaintiff was committed to an asylum. Subsequently she sued the commissioner, the two physicians and another for malicious prosecution. The trial court sustained demurrers interposed by the defendants and the plaintiff appealed to the Supreme Court of Minnesota.

In affirming the action of the trial court, the Supreme Court pointed out that a judge is not liable in a civil action to any one for his judicial acts, however erroneous or by whatever motives prompted, that the physicians were quasi-judicial officers and that what they did was in the scope of their duties as such. That being so, these physicians, the Court concluded, were within the protection of the rule and immune from suit—*Linder v. Foster et al*, 295 N. W. 299 (Minn., 1940).

Texas State Medical Association of Houston, May 11-14. Dr. H. E. Taylor, 1404 West El Paso St., Fort Worth, Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending, but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

- Role of Alkaloids of Belladonna Plants in Clinical Anesthesia M. L. Phelps, New York—p. 71
- Massive Atelectasis During Anesthesia Case M. C. Peterson and I. M. Fallon, New York—p. 79

Picrotoxin in Acute Barbiturate Poisoning—Richards and Menaker cite 11 cases of barbiturate poisoning treated with picrotoxin. In 1 case 105 grains (7 Gm.) of soluble phenobarbital and 1,944 mg. of picrotoxin were used, and recovery ensued. Five of the 11 patients died. With the exception of 1 patient who ingested only 18 grains (12 Gm.) of soluble phenobarbital, all of them presented severe poisoning. Published reports on the use of picrotoxin reveal that the authors attribute to the drug an important, frequently a life saving, role. Sudden acute death from respiratory failure due to oral barbiturate poisoning is rare, in fact, most of the patients who die do so two to five days after ingesting the drug. Death is due to general depression, to cerebral edema or to pulmonary complications. Treatment must be directed against these dangerous symptoms and the underlying cause for them removed. Experimental and clinical data indicate that picrotoxin possesses an extremely potent stimulating action on the depressed centers. Picrotoxin in barbiturate poisoning is not a panacea, and its use means neither that the problem is solved nor that other forms of treatment are superfluous.

Serial Spinal Anesthesia—Haugen and his co-workers believe that the term "continuous spinal anesthesia" does not adequately describe Lemmon's technique and suggest "serial [repeated] spinal anesthesia." Their clinical experience, although meager, confirms the belief that the element of control introduced by the method is a definite advantage for many types of operation: the initial dose is smaller, which increases safety; the anesthesia may be maintained over a prolonged period; failure may be prevented in the rare case in which a large dose is required. The disadvantages are largely technical, one of them being that special equipment is required.

- Gynecology Endometriosis J. V. Meigs, Boston—p. 147

Salmonella Supestifer Infection—From their survey of the clinical features of Salmonella supestifer infections it is apparent to Goulder and his collaborators that although the disease tends to follow a course similar to typhoid it may localize in any site. The most frequent sites are the lungs, bones and joints. The infection appears most often when the resistance of the patient is low. Therefore epidemics of S. supestifer infection tend to develop in populations already weakened by starvation and exposure, and the disease often appears sporadically in persons with some chronic disease. This fact may account for the resulting high mortality rate. The authors report the fourth case of endocarditis due to S. supestifer. Except for the bacterial endocarditis, the postmortem observations in their patient, a woman of 58, were the usual ones. The salient features of the 4 cases of proved bacterial endocarditis due to S. supestifer were in 3 endocarditis superimposed on a valve already damaged by rheumatic infection or syphilis, embolic phenomena, a high fever with chills and leukocytosis in all and changing murmurs in 3. The sulfonamide drugs were used in 3 of the 4 patients, but there was no evidence that the drugs had any appreciable effect. Their case of S. supestifer endocarditis prompted the authors to review the occurrence of S. supestifer infection during the last six years as encountered in the clinics cooperating with the Peter Bent Brigham Hospital. There were 10 instances of sporadic infection due to the European type of S. supestifer, 6 occurred in children, 2 in newborn infants and 2 in parturient women. One of the newborn infants died after both bacteremia and meningitis had developed. All the patients had a high fever for eight to thirty-eight days, 8 had positive blood and 3 positive stool cultures. The patient with bacterial endocarditis had positive stool, urine and blood cultures. The composite clinical picture included chills and fever, coryza and pharyngitis, pneumonia, splenomegaly, abdominal pain, vomiting, diarrhea, arthritis, meningitis and bacterial endocarditis. If the bacteremia was uncomplicated the leukocyte count tended to remain low, but, once the infection localized, leukocytosis usually developed. The serum of most of the patients with S. supestifer infection had high agglutination titers which persisted for a few months to six years after the infection subsided. Standard antigens and properly prepared antisera should be used for identifying the various Salmonella organisms.

Furmethide—Lipton and his associates observed the action of furmethide (furfuryl trimethyl ammonium iodide) given orally and subcutaneously on the bladder of 12 normal subjects and on the atonic bladder of 3 patients after a one stage abdominal operation for adenocarcinoma of the rectum. Its effect was to increase tone and restore atony to or toward normal. The drug effectively controlled the dysfunction of the bladder in the 3 patients. Although side reactions may be appreciable after large doses, it is possible to find an effective dose that does not cause significant disconcerting side effects, such as salivation, sweating, a feeling of warmth and a desire to void.

- Emotional Factor in Bronchial Asthma. J. A. Hauman, New York.—p. 80.
- Relation of General Hospital to Psychiatry. J. B. Gordon, Marlboro.—p. 84.

Timing Blood Coagulation.—Knauer outlines a method for determining the coagulation time of the blood. He recommends the use of a hypodermic syringe with a slightly larger needle than is used ordinarily. Blood is withdrawn from a prominent vein, a few bubbles of air are drawn into the syringe, the syringe is laid on its side for three minutes and then it is tilted slowly from end to end so as to permit the bubbles with their interspaces of blood to travel slowly from one end to the other at intervals of fifteen seconds. It is soon observed that the rapidity with which the bubbles traverse the length of the syringe is decreased with the formation of the clot and that thirty to forty-five seconds transpires between the onset of clot formation and its completion. This is noticed by the almost complete immobility of the bubbles

Acuminate Condylomas.—Kaplan suggests the application of 25 per cent podophyllin in liquid petrolatum to all condylomatous masses. Six to eight hours after the application pain, which usually requires codeine sulfate or morphine for relief, is experienced. During the next twelve hours a decided local reaction, with inflammation and edema throughout the tissues near the site of application, ensues. On the second or the third day the condylomas begin to slough off and the pain ceases. On the fourth or fifth day the tissue returns to normal. No scarring is visible. A single application is usually sufficient. A weaker solution requires repeated applications, and the pain is almost as severe. In this manner the author cured 20 patients who had acuminate condylomas and venereal warts.

Incidence of Cancer in Texas.—McDowell states that the total of 2,592 cases of cancer reported for Dallas County and the 1,091 for Tarrant County during a study year makes the rate for the prevalence of cancer among residents of this area 140 per hundred thousand, a rate higher than that in any of the five cities surveyed so far except Atlanta—24 for Chicago, 25 for Pittsburgh, 37 for Detroit, 129 for New Orleans and 157 for Atlanta. The primary sites most often involved among males in the order of frequency were the skin, the buccal cavity, the digestive tract and the genitourinary system. Among women the order is the genitourinary system, the breasts, the skin and the digestive tract. There was a clear relationship between the primary site and the age of the patient. The percentage of cases of cancer of the prostate, the skin and, to a lesser extent, the digestive tract increased as age increased; malignant growths of the female breast and uterus and all respiratory cancers were most frequent in persons in the middle portion of the life span, while cancer of the brain, bones and "all other sites" was relatively more frequent in persons less than 35. At least 23 per cent of the patients died within one year of the diagnosis of their cancer, 60 per cent of those with cancer of the digestive tract and brain, only 3 per cent of those with cutaneous cancer and 10 per cent of those with malignant growths of the buccal cavity.

Scarlet Fever Immunization.—Graham evaluates some of the methods for immunization against scarlet fever. The intranasal, the oral, the intruction and the intradermal methods are inadequate. The intranasal method is inadequate unless rechecked by the Dick test every one to three years, and when the reaction again becomes positive additional antigenic stimulus must be administered until the Dick reaction is negative or protection may not be sufficient. The Dick subcutaneous injection method confers the most lasting immunity. When reactions follow it is likely that among the subjects who react there will be a higher percentage with a reversal to a positive reaction than among subjects with no reactions. With the Dick method the author has secured an 84 per cent immunity over a period of fifteen years. The test compares favorably with plain toxoid (78 per cent) but is probably inferior to the immunity obtained with two or three injections of alum precipitated toxoid. For general use the Dick method is superior to any other.

Meat Borne Typhoid Outbreak.—Duff and Hardison give an account of 7 cases of typhoid in Cumberland County, Tenn with 2 deaths. Investigation suggested that the only common factor of epidemiologic significance for 4 of the patients was the food served for Thanksgiving dinner. The only food prepared outside the home was souse, or head cheese. This product was eaten also by 2 of the other patients. Study of the avenue of infection disclosed that the souse had been prepared by a white woman who had had typhoid in 1930 and who for several years afterward had had attacks of nausea, vomiting, abdominal discomfort and pains in the region of the gallbladder. Successive enteric cultures confirmed the suspicion that she was a typhoid carrier. The seventh patient in the outbreak had not eaten any of the souse but since she had been in continuous contact with her daughter, who had known typhoid, it was assumed that the disease in her was secondary. Eberthella typhosa was isolated from the souse three months after its preparation.

Milk, a Human Poison.—Davidson studied the role that milk played in producing allergic symptoms among 100 patients at least 6 years of age whose manifestations (not due to seasonal pollens) justified complete testing and of 20 infants and children up to 4 years of age. Of the 100 patients 82 reacted to milk, 70 to egg, 39 to wheat, 50 to cottonseed, 95 to house dust and 90 to hairs, respectively symptoms were produced by these allergens in 40, 27, 8, 6, 51 and 9 per cent of the patients. Of the children 85 per cent reacted to milk, 63 to egg, 60 to wheat, 44 to cottonseed, 71 to house dust and 75 to hairs, and the allergens produced symptoms respectively in 55, 40, 40, 10, 45 and 10 per cent of the children. The symptoms complained of by the older group of patients were, in order of frequency, asthma, hay fever, urticaria, eczema, migraine, gastrointestinal upsets, conjunctivitis and acne, for the children they were asthma, eczema, hay fever and urticaria. The author believes

that in any allergic syndrome of perennial occurrence there is a 40 per cent or better chance that milk plays a leading role in producing the symptoms.

Sulfapyridine and Sulfathiazole in Pneumonia.—Kelley used sulfapyridine for treating 213 and sulfathiazole for 100 patients with lobar pneumonia. In all 16, or 7.5 per cent, of the patients given sulfapyridine and 7, or 7 per cent, of those given sulfathiazole died. If the patients who died during the first day of treatment are omitted, the respective fatality rates become 5.1 and 3 per cent. As is usually found, the mortality rate was greater among patients past their youth and in those with bacteremia, extensive pulmonary consolidation or antecedent disability. The benefits from sulfapyridine and sulfathiazole were similar, although with the latter the concentrations of the free drug in the blood as a whole were greater and relief of the acute illness was generally more prompt. Nausea and vomiting were far more frequent when sulfapyridine was used. Certain patients with renal damage had dangerously high levels of the free drug in the blood after a relatively short period of treatment with sulfathiazole.

Human Bites of Hand.—Miller and Winfield state that injuries from human bites range from actual bites of the phalanges and hand to puncture wounds and lacerations produced by a fist striking exposed teeth. A more rare mechanism is that of sucking hangnails or the contamination with mouth organisms of a clean lacerated wound by a concerned bystander. Early infections due to human bites consist almost twice as often of lacerations of the fingers as of lacerations of the knuckles. In cases of late infection the reverse is true. The injury presented may be a simple cutaneous abrasion over the phalanges, knuckles or palmar surface of the hand or wrist, a complete avulsion of the cutaneous and subcutaneous segments and occasionally of the bone, a penetrating laceration either partially or

completely sevring the extensor tendon or a wound which may have opened into the dorsal subcutaneous space, subtendinous bursa, dorsal subaponeurotic space or the joint cavity. The routine treatment employed is to wash gently the area about the wound with soap and water for five minutes and then the wound itself and then to irrigate the wound with saline solution for ten minutes. The wounds are not probed. After the mechanical cleansing and probably a limited débridement, wet dressings are applied. No attempt is made to repair the rent in the joint capsule. Hands are splinted in the position of function. Lacerations are never sutured, nor are injuries to deeper structures repaired. Patients return daily for examination, and if a joint is involved they are usually hospitalized. Sixty-one early infections from human bites of the hand have been given prophylactic treatment during the last three years. Fifty-five of the wounds remained clean, five became mildly inflamed and one became grossly infected. The average wound healing time was eight and five-tenths days. After-care consisted essentially of splinting and the application of continuous compresses of saline solution, boric acid or magnesium sulfate for forty-eight hours, when they were discontinued if the wound remained clean. Splinting was continued until healing was complete. The therapy of human bites seen late, which are already serious and sometimes extensively infected, should emphasize adequate surgical intervention and earlier and more radical drainage. The hand is thoroughly cleansed under general anesthesia, as much infected and gangrenous sloughing tissue is removed as possible and areas of infection are adequately drained. The deepest anatomic plane involved should be inspected. Infection of the joint, if adequately drained, need not result in an ankylosed joint; excellent function may be obtained. One should be slow to amputate extensively infected fingers, but extensive drainage of the soft parts is essential. Amputation should be avoided when acute infection is present. After the wound has been cleansed and debrided and drainage has been established it is loosely packed with petrolatum gauze, and massive wet antiseptic dressings are applied. The fingers, hand and arm are splinted in the position of function and arranged so as to favor drainage. Patients with such wounds should be hospitalized. Of the 54 patients with late infected injuries due to human bites, 13 remained with stiff fingers. Despite the severity of these infections, the average healing time was thirty-four days and the average hospitalization period was nine and four-tenths days. There were no fatalities. These infections are prone to recur and exacerbate frequently. There were 3 instances of recurrence among the 54 patients.

Treatment of Peritonitis.—Epps and Howard studied the effect of four sulfonamides on experimental appendicitis, comparable to that in man, in 70 dogs. In a control group of 10 untreated dogs the mortality rate was 100 per cent. The therapeutic value of the local application of sulfabenzamide, sulfanilamide, sulfapyridine sodium and sulfathiazole was determined. The results seem to indicate that subcutaneous or intraperitoneal administration is preferable to the intravenous route. This is explained by the relatively short action of sulfanilamide when given intravenously. Of the four drugs used intraperitoneally, sulfathiazole was the most effective, probably because part of the drug was given in suspension, allowing a longer time for action before absorption was complete. The number of dogs given one of the sulfonamides was small; however, the authors are certain that any one of the drugs may be administered intraperitoneally with safety and without deleterious effect to the peritoneum or intraperitoneal organs. The usual toxic manifestations must be anticipated and the patient treated accordingly if they arise. Sulfapyridine sodium has been used intraperitoneally in a 4 per cent solution for 10 patients at the Oklahoma University Hospitals. The results have been spectacular. When the drug was given only by the intraperitoneal route, serious toxic manifestations were not encountered.

Acute Embolic Occlusion of Arteries to Extremities.—According to Atlas, when an artery in an extremity is acutely obstructed by an embolus it is necessary to restore immediately sufficient circulation to the limb to preserve its viability and to promote therapeutically a collateral circulation, so that the functional capacity of the limb as well as its viability will be preserved. Both are accomplished by increasing the volume

rate of blood flow through the available collateral circulation. Any method that augments the quantity of blood flowing through a collateral arterial network diminishes the peripheral resistance to blood flow through a dilatation of the arteriolar-capillary bed into which collateral vessels empty. Since ischemic tissue is saturated with vasodilating substances, such an increase in the flow of blood through collateral channels would automatically follow the acute occlusion of a principal artery. Often an effective collateral circulation develops without therapeutic assistance. There would be many more such instances if it were not for the fact that, when an embolus suddenly occludes a peripheral artery, the arterial bed in that extremity, and sometimes in the opposite extremity, is thrown into a greater or lesser degree of spasm. An embolus lodged in the distal portion of an extremity may reflexly render the more proximal and larger arteries pulseless. Unless spasm is considered, these larger spastic vessels may be surgically explored for the purpose of removing what is erroneously considered to be the offending embolus. When the collateral circulation in an extremity rendered acutely ischemic is so spastic that vasodilating substances surrounding it do not relax it, the use of heat as an additional dilating stimulus is not only illogical but dangerous. During the acute stage of an embolic occlusion, treatment should be concerned with relaxing spastic vessels and preventing their thrombosis. To secure relaxation the intravenous injection of 0.032 Gm. of papaverine hydrochloride every four hours for forty-eight hours and then three times a day for a week is almost specific. Heparin is administered to prevent thrombosis; 50 mg. is given intravenously every four hours. The limb is then swathed in cotton and protected with an unlighted cradle. After the spasm disappears, measures may be instituted to stimulate further the flow of blood through collateral channels. Local application of mild heat, rhythmic venous occlusion and suction pressure may be employed. Should the ischemia fail to improve or progress despite treatment, organic block of a major vessel must be considered and embolectomy performed. Persons who have sustained an embolic occlusion may present themselves several weeks after the accident. In them a periarteritis often involves the thrombosed vessel and stimulates afferent sympathetic neurons with resultant pain or reflex spasm of the collateral bed. The offending thrombosed arterial segment should be resected.

Thoracoplasty for Pulmonary Tuberculosis.—Edwards and his collaborators adhered to the following indications in the treatment of 59 patients between 1933 and 1940: The disease must be unilateral and the lesion fibrotic, pneumothorax must have failed and the age of the patient should be between 15 and 45 and his general condition good. Of the patients 52 had parenchymatous disease and 7 had tuberculous empyema. A total of one hundred and fifty-eight thoracoplasties were performed, and a follow-up study in May 1941 showed that 35 patients (68 per cent) were fit and well and 30 of them able to work. Nine patients are still unfit or have a positive sputum, and 8 have died. Of these 52 patients 40 were considered "good risks" (30 of whom are fit and well and have a negative sputum) for thoracoplasty and 12 "justifiable risks." Of the 7 patients with tuberculous empyema 5 have died and 2 are not fit; 1 needs a plastic operation and 1 is losing weight. Operation undertaken on such patients before the general effects of the toxemia become too definite and the pleural membranes too thickened would undoubtedly result in more satisfactory results. The authors declare that from the public health point of view no person with a positive sputum should be at large in the community. A ten rib paravertebral thoracoplasty with removal of the transverse processes is the procedure of choice.

Vitamin A and Dark Adaptation.—Yudkin studied the effect on dark adaptation of giving 100,000 international units of vitamin A on an empty stomach to 24 patients. Food was taken after three hours. The dark adaptation was measured after one, four, seven, ten and twenty-four hours. The results varied, but usually an improvement in dark adaptation began in about two hours and was maximal in eight to ten hours. Within twenty-four hours the curve had usually returned to the original low state. A few patients did not have hemeralopia again for several days or even weeks. The final rod threshold, the final cone threshold and the rod-cone transition time all were usually affected. There would be no effect in an extremely deficient subject until several doses of 100,000 international

units were given, and then the reaction was transitory. After a few more doses the usual improvement and relapse would ensue. After still more doses the hemeralopic patient would not return for three or four days, after which a much smaller dose produced a result. The response to further large single doses lasted for weeks or even months. The author believes that the best way to decide whether a person's night blindness is due to a deficiency of vitamin A is that suggested by Steven and Wald, or the determination of "threshold lability," i. e. the fall from a high to a significantly lower final rod threshold after about ten large doses of vitamin A. The appearance of vitamin A in the blood four to five hours after any dose will show that the vitamin is being absorbed. Night blindness due to vitamin A deficiency will almost certainly improve after two large doses, but if no response occurs it may be assumed that the night blindness is not due to a deficiency of vitamin A. The value of giving 500 mg. of vitamin C for ten days, as suggested by Stewart and by Kimble and Gordon, was studied on 6 patients with poor dark adaptation. No improvement was observed, whereas the adaptation of all of them became normal after treatment with vitamin A. Yudkin concludes that vitamin A may not be the only factor affecting the complicated process of dark adaptation; any link in the chain may be affected: oxygen, hypoglycemia, amphetamine sulfate and alcohol may all affect dark adaptation; the latter two cause improvement and the former two deterioration. Congenital and hereditary night blindness and certain retinal diseases affect dark adaptation independently of the adequacy of vitamin A. Even when hemeralopia is cured with vitamin A it is not known which part of the metabolic cycle was at fault.

Recovery from Granulocytopenia After Rigor During Transfusion.—Cross reports that an airman aged 20, who was inoculated on Aug. 18, 1941 with T. A. B. and ATT [antitetanus toxoid?], had pyrexia with a severe local reaction on August 19 and during the next ten days was given 42 Gm. of sulfapyridine by mouth. By this time he complained of tenderness of the lower gums and stiffness of the nuchal muscles, and the tonsillar glands were enlarged. The leukocyte count was 2,500 per cubic millimeter, and the granular leukocytes were absent. He was given intramuscular injections of 10 cc. of pentnucleotide twice a day for seven days. After 500 cc. of blood of group 0 had been given on September 1 the total leukocyte count increased to 3,500 and the neutrophils numbered 3 per cent. By this time the lower gums and cheek were ulcerated, the tonsillar glands were enlarged and painful and there was intermittent pyrexia, the temperature rising to about 100.2 F. After pentnucleotide had been given for two more days the total leukocyte count increased to 5,000, with 6 per cent neutrophils. A second transfusion was given on September 4 and the leukocyte count increased to 8,000, with 13 per cent neutrophils. Tenderness of the glands decreased, and the patient felt much better. A third transfusion was started on September 8 but had to be discontinued because the patient had a severe rigor lasting about fifteen minutes. Blood films taken immediately after the rigor showed a slight increase in the total leukocyte count and in the percentage of neutrophils. Four hours after the rigor, the temperature rose to 105.6 F. and the total leukocyte count was 40,000, with 85 per cent immature neutrophils. Next morning the temperature was normal, and in two days the ulceration of the gums was completely healed. During the next four days the total leukocyte count and the percentage of neutrophils gradually returned to normal and the cells appeared progressively more mature. The patient was discharged from the hospital on October 8, fully recovered. There was no question of transfusion of incompatible blood; so the cause of the pyrexia remains a mystery. Nevertheless it effectively aborted the granulocytopenia and suggests that artificial but controlled pyrexia, if used with caution, might be useful in aborting such attacks.

Heart Disease and Military Physician.—Hadorn maintains that anatomic defects of the heart may result from functional disturbances. The assumption of spastic-functional-ischemic-necrotic processes is entirely justified. Neurocardiac disturbances may develop into myocardial lesions without an intercurrent infection. One should pay attention to all the complaints of soldiers which refer to the cardiovascular system. The early symptoms of circulatory disturbances are nearly always subjective. The patients complain of palpitation, sweats, fatigue, dyspnea, insomnia, weakness, fainting and darting heart pains. Specific information should be sought as to the type of dyspnea. Pain in the cardiac region must be investigated. Formerly substernal pain was regarded as of organic origin, a symptom of ambulatory angina pectoris, whereas pain in the region of the cardiac apex was considered nervous or neurotic. Electrocardiographic records revealed that darting pains in the region of the heart may be of coronary or myocardial origin. Certain symptoms and minor alterations in signs, which were formerly overestimated and regarded as sufficient for rejection, are of no importance. Moderate palpitation is not significant. Palpitation and tachycardia are not identical; tachycardia by itself is of no particular importance. Respiratory arrhythmia and occasional extrasystole, if occurring alone, likewise do not establish the presence of heart disease. Although extrasystoles are no longer considered as "harmless mischief of the heart" (Wenckebach), the monotopic ones are of no particular importance when heart and circulation are otherwise normal. Electrocardiography reveals whether the extrasystoles are monotopic or polytopic. If extrasystoles appear immediately after exertion they are not harmless. Extrasystoles can be brought on by the use of nicotine, chronic constipation, meteorism and an elevated diaphragm. Every extrasystole demands a search for foci of infection. Auricular extrasystoles must be estimated differently from the ventricular ones, because they may become frequent and lead to paroxysmal tachycardia and auricular fibrillation. Paroxysmal tachycardias which appear only at great intervals do not render one unfit for military service. Systolic murmurs, formerly regarded as identical with mitral insufficiency, are generally of little importance. Attention must be given to a history of infections, articular rheumatism, chorea minor, diphtheria, syphilis, tonsillitis and infection of the teeth and sinuses. Coronary complaints should be taken seriously at any age. Objective examination by the military physician includes examination of the pulse, inspection, palpation and percussion of the cardiac region, roentgen examination and electrocardiography. Electrocardiography is most important. The simple test of holding the breath may be employed to determine the work capacity of the heart. Observations on the pulse frequency, blood pressure and respiratory rate before and after a certain exertion constitute the functional examination. Other tests mentioned are the "getting up reaction," the hepatic pressure test of Plesch, Volhard's test, the separate measurement of the day and night urines, the examination of the urine for urobilinogen, the roentgenologic examination of the lung for stasis, probatory strophanthin injection according to Fraenkel and the exertion electrocardiogram.

Rheumatic Disorders in Military Service.—According to Heinemann the incidence of rheumatism in the army has increased since the onset of the war, since older men have been called for prolonged service. The exertions and exposure of military service are contributing causes. A number of etiologic factors determine the variable symptoms of rheumatism. The control and supervision of rheumatic disease should be in the hands of physicians with special training and experience in rheumatism, so that suitable measures may be instituted

early, patients with hopeless disease discharged and unnecessary dismissals avoided. Antipyretics, salicylic acid and choline derivatives have proved effective in the treatment of rheumatic disorders. Aminopyrine proved particularly effective in chronic rheumatic disease. Sulfur normalizes the impaired blood perfusion of the skin. A catalytic activation of the mesenchyma with stimulation of its phagocytic activity is ascribed to the colloidal gold preparations. It has not been determined to what extent sulfonamide derivatives influence the course of rheumatism, but their use is indicated whenever infectious foci are found. Exercise should begin early, but during the acute stage rest should not be interrupted by gymnastics and massage, particularly in the presence of inflammatory articular exudates. Gymnastics and massage should be carried out only by well trained persons. Too little attention is given to the necessity of a lactovegetable diet. Static defects are often contributory causes in rheumatism, and they should be corrected by orthopedic treatment. Spread, sag and flat feet are the chief orthopedic defects that cause changes in the neighboring joints. Some complaints referable to the hip joint in soldiers are the result of an anlage to coxa vara. Men with static dynamic difficulties due to defects of the vertebral column can be kept in army service by transferring them to a unit requiring less physical exertion. The author regards the removal of suspected infectious foci advisable in spite of the realization of the plurality of causal factors of rheumatism.

Día Médico, Buenos Aires

14:17-32 (Jan. 12) 1942. Partial Index

- *"Pseudocholangiopathic" Form of Coronary Thrombosis. P. A. Tapella.—p. 24.
 *Substitutes for Blood Transfusion. A. Battaglia.—p. 28.

"Pseudocholangiopathic" Form of Coronary Thrombosis.—Tapella reports 3 cases of typical acute coronary thrombosis associated with jaundice. The clinical diagnosis was confirmed by electrocardiograms. Jaundice appeared within twenty-four hours of the attack. It lasted for about ten days and disappeared in the next three or four days. Symptoms of disease of the liver, the gallbladder or the bile ducts were not present either before or after the coronary accident, although the patients were observed for two to four years after the attack. The gallbladder and bile ducts were normal when observed cholangiographically. The author believes that in this type of coronary thrombosis jaundice is due to a reflex which originates in the lower cardiac nerve, reaches the zone of confluence of the nerve with the great splanchnic nerve at the paravertebral sympathetic ganglions and stimulates the bile ducts through the great splanchnic nerve. The name pseudocholangiopathic coronary thrombosis is suggested for this type of attack.

Substitutes for Blood Transfusion.—According to Battaglia the so-called blood substitutes or artificial serums are of value only in emergency, when blood plasma or blood serum cannot be obtained. The order of value of blood substitutes in acute hemorrhage is as follows: blood plasma, blood serum, Ringer-hemoglobin solution, isotonic solution of sodium chloride with acacia, erythrocytes suspended in crystalloid solutions, isotonic sodium chloride solution and isotonic dextrose solution. The therapeutic effects of blood plasma are as good as those of blood serum. Liquid plasma can be preserved only for a few weeks, after which there is danger of precipitation of fibrinogen. Plasma diluted in isotonic solution of sodium chloride up to approximately the primary volume of total blood can be preserved without precipitation for a long time. Desiccated blood serum and plasma can be kept indefinitely and used in various concentrations according to proper indications. The use of blood serum and plasma for transfusion does not involve blood group testing. These substances do not cause unpleasant reactions. When large doses are transfused it is advisable to use blood serum or plasma from donors of corresponding blood groups. Artificial serums may be used as substitutes for blood transfusion only when compatible blood, blood serum or plasma is not available. Transfusion with blood serum or plasma is mainly indicated in shock of any origin, acute burns, acute hemorrhage, hypoproteinemia, certain forms of nephrosis and intracranial hypertension.

Book Notices

Youth and the Future. The General Report of the American Youth Commission. Cloth. Price, \$2.50. Pp. 296. Washington, D. C.: American Council on Education, 1942.

The American Youth Commission, which has heretofore published brief statements and pamphlets and has previously dealt with segments of the youth problem in book publications, now issues this general report, in which various phases of youth problems in depression, in prewar days and in war time are considered. The book has an explanatory foreword and introduction by Owen D. Young, chairman of the commission, and four principal parts. Part I contains five chapters dealing respectively with youth unemployment as a continuing problem, experience with youth work programs, work programs for youth in the future, relations between schools and youth work programs, and the problem of full employment. In part II are eight chapters touching on various phases of the basic problems of youth, such as general needs, education, occupational adjustment, the use of leisure time, marriage and the home, health and fitness, delinquency and youthful crime, and education for citizenship. In part III are four chapters dealing with the different aspects of responsibility for action for youth as they arise in communities, in state governments, in the federal government and in the relationships of public and private agencies related to planning and action for youth and by youth. Part IV has one concluding chapter entitled "Meaning for Life."

The book is a broad, comprehensive, sincere, inspiring and compelling study. Its conclusions are far reaching and far seeing. A real effort has been made to see the problem as a whole, regarding youth as one segment of our population, but a segment of tremendous potential importance, both for the present, the immediate future and the far distant horizons of national destiny. It is not to be expected that every reader will agree with the conclusions in the report, but every honest reader must admire the courage and respect the sincerity of the conclusions reached and those who reached them.

The medical profession is most concerned with those aspects of the report dealing with health and fitness. These are dealt with primarily in chapter II but are not overlooked elsewhere, as indicated by numerous subsidiary references to health and fitness in connection with other phases of the youth program. The report calls for greater attention to the health of youth, even though youth is essentially a healthful time of life, comparatively speaking. Youth, nevertheless, has definite problems, of which the four principal ones are listed as tuberculosis, the venereal diseases, appendicitis and rheumatic heart disease. The emotional and personality problems of youth are dealt with at considerable length, not only in this chapter but in others, with appropriate emphasis on the fundamental need of man at any age, namely emotional security and a sense of being needed. One could differ with details in the proposals of the commission, but one can hardly differ with its fundamental premises. For instance, one might be inclined to question the efficacy of a youth health program beginning with a physical examination at the age of 18, especially since dental defects, which are admittedly the leading deviation from normal in our nation, are probably determined in utero or immediately after birth.

The demand of the commission for something rather immediate in the way of health insurance systems, with the implication that nothing along this line has been done, could be questioned in the light of the widespread prevalence of hospital insurance plans and the experiments by medical societies and other agencies in attempting to arrive at a formula for delivering medical service to all the people at a price which the people can pay. Yet in the main the commission stands for those things for which the medical profession has stood; namely, free choice of physician and cash benefits.

100 Years of Medicine in Minnesota. Boards. Pp. 26, with illustrations. St. Paul: Minnesota State Medical Association, 1941.

The Minnesota State Medical Association, in celebrating the hundredth anniversary of the arrival in what is now the state of Minnesota of the first civilian practitioner of medicine, sent to community leaders and institutions a copy of this interesting booklet. The progress of medicine in Minnesota from the time

Dr. Christopher Carli arrived at what is now Stillwater on May 24, 1841 is shown in pictures. Only twelve years later most of the twenty-hardy doctors in the territory met in St. Paul to form the Minnesota Medical Society, the forerunner of the present state medical association, which has nearly three thousand members in thirty-four component county and district societies covering every section of the state. Close cooperation between the private practitioners and the Minnesota State Board of Health during these hundred years practically eradicated many of the diseases that scourged this territory. Today Minnesota is said to lead in the control of tuberculosis and syphilis and in the saving of mothers and babies. In 1841 more than half of the babies died before they were 5 years old and three fourths of the people died before they were 40. Today only 8.2 per cent of the babies die under the age of 5, and more than half of the deaths are delayed until after 60. Children as well as adults will be much interested in this pictorial history. The editorial material found here and there among the pictures will also appeal to practically all ages, and it is simply stated and very clear.

The March of Medicine. The New York Academy of Medicine Lectures to the Lally [Number VI], 1941. Cloth. Price, \$2. Pp. 154, with 3 illustrations. New York: Columbia University Press, 1941.

This collection of essays represents the sixth set of a series of lectures to the public at the New York Academy of Medicine. It is the third volume to bear this title, the other two having been published in 1939 and 1940. Since the purpose of the lectures is to show historically how medicine has developed and to present its social and cultural significance, each lecture should interest the physician and the layman and should be written in terminology requiring no special knowledge of medicine or the allied sciences. As in the past, the writers on the whole have pursued this goal with some success. After a terse foreword by Dr. Malcolm Goodridge, and a philosophic introduction by Dr. Haven Emerson, the collection presents articles entitled on humanism and science, by Dr. Alan Gregg, Paracelsus in the light of four hundred years, by Dr. Henry E. Sigerist, psychiatry and the normal life, by Dr. William Healy, philosophy as therapy, by Irwin Edman, Ph.D., the promise of endocrinology, by Oscar Riddle, Ph.D., and what we know about cancer, by Dr. Francis Carter Wood. A fairly adequate index completes the collection and is a somewhat unique feature for a book of this type. Although the essays are designed primarily for the layman, it is probable that only a select group will obtain the utmost from them, as the authors occasionally become too philosophic to maintain the interest of the average man in the street. Readers who have had more than the usual training in the various sciences should enjoy the book. As Haven Emerson said in his introduction, "Glamor and romance there is in abundance in medicine for student, practitioner and patient." The articles in this volume aid materially in stressing this fundamental truth.

Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases. By Richard P. Strong, Consultant in Tropical Medicine to the Massachusetts General Hospital and the Boston City Hospital, Boston. In Two Volumes. Sixth edition. Fp. Price, \$21 per set. Pp. 871, with 197 illustrations; 872-1747, with 201 illustrations. Philadelphia: Blakiston Company, 1942.

Dr. Strong has taken over from Admiral Stitt, U. S. Navy, retired, the authorship of this work. While this is said to be a revision of Admiral Stitt's book, it is in fact a new work, much more comprehensive than its predecessor, largely rewritten and made also a book of reference to recent research. The comprehensiveness of the work is indicated in the opening chapter on malaria, which in itself comprises one hundred and thirty-five pages, not counting a second chapter of some twenty-eight pages on blackwater fever. Knowledge of tropical diseases has increased much in recent years, and that too accounts in part for the increase in the size of the publication. The illustrations in some chapters are adequate. A helpful part is the appendix. In an index of clinical diagnosis are pointed out the diseases in which the symptoms associated with tropical diseases may arise. The second chapter of the appendix concerns laboratory procedures used in diagnosis; for example, under amebiasis the author advises one to examine the feces for cysts and trophozoites; also that amebiasis may show monocytosis, and that one should differentiate from bacillary dysentery and chronic non-

specific ulcerative colitis. The third section of the appendix, on tropical hygiene, discusses the effects of sunlight, altitude, storms, atmospheric pressure, heat, humidity, mountain climates, the effects of heat on the white and brown races, acclimatization and colonization; and this is followed by a discussion of the clothing, tropical housing, vaccinations that one should have on going to tropical climates, equipment, diet, infant feeding, beverages, water purification, sewage disposal and insects. Dr. Strong is eminently fitted to take up this work. He has served in various capacities in many tropical countries and now is a consultant to the Secretary of War on tropical medicine and a professor of tropical medicine emeritus at Harvard University. This work will take its rightful place among the great works on tropical medicine.

Clinical Roentgenology of Pregnancy. By William Snow, M.D., Director of Radiology, Bronx Hospital, New York. Cloth. Price, \$4.50. Pp. 178, with 119 illustrations. Springfield, Ill., and Baltimore: Charles C. Thomas, Publisher, 1942.

This book was written to serve "as a working manual and as a ready reference" on the subject of roentgenography in obstetrics. It is based on the author's extensive experiences in this field. The chapters are devoted to a general discussion of the use of x-rays in pregnancy, positioning of the patient and technic of x-ray exposures, x-ray pelvimetry and cephalometry computations, the pelvic shape and its measurements, the fetus and pelvis, x-ray visualization of the soft tissues in pregnancy and case reports. Since the author was a pioneer in the x-ray visualization of the soft tissues in pregnancy, it is only natural that the longest and best chapter in the book is the one which deals with this subject. He also describes his own method of x-ray pelvimetry and cephalometry. There are one hundred and nineteen illustrations in the book, but many are not clear and a good number have been touched up, which spoils their value. Seventeen illustrations are devoted to placenta previa. The author has drawn a few illustrations which are distinctly amateurish. There is considerable waste space in the book, particularly on the pages opposite certain roentgenograms where the entire page is blank except for a few words in the center. In spite of these shortcomings the book should prove of great value to every one interested in roentgenography as it pertains to obstetrics. It is well written, and the publishers have done their part admirably.

Technique of Gastric Operations. By Rodney Maingot, F.R.C.S., Senior Surgeon to the Southend General Hospital and to the Royal Waterloo Hospital, London. Cloth. Price, \$4.50. Pp. 240, with 55 illustrations. New York & London: Oxford University Press, 1941.

This is a brief but in many ways excellent treatise on gastric surgery. The author states that he intends mainly to outline surgical technic, which he does quite well. A few more illustrations would probably be helpful in permitting the reader to follow more easily the complicated steps associated with the accurate performance of such operations as the Haberer modification of the first method of Billroth. Maingot finds it difficult to separate completely technical aspects from clinical findings and results. This is, perhaps, the only but none the less serious drawback to a book of this nature. The problems of gastric surgery are so complex and so intricately related to clinical experience that the proper choice and application of the many procedures available are indeed difficult: so much so that only surgeons of great experience are able to cope successfully with them. The occasional operator in the field of gastric surgery cannot hope to produce results equal to the master in the field. The problem of late results in gastric surgery, whether for benign or for malignant lesions, is almost as pressing as the immediate postoperative recovery. A book of this nature, necessarily brief, will only mildly attract the experienced and not sufficiently educate the inexperienced. Maingot's vast knowledge in this field, which is self evident, tends to overcome this objection in part. Technics described include the Rammstedt operation and its modifications, popular variations of the first and second Billroth types of resection, gastroenterostomy, gastrotomy and certain other operations involving the stomach and adjacent structures. Illustrations are clear and simple, and the descriptive text is concise and logical. The author has undertaken a difficult task and has crammed considerable of a perplexing subject into the brief confines of this book.

Clinical Hematology. By Maxwell M. Wintrobe, M.D., Ph.D., Associate in Medicine, Johns Hopkins University, Baltimore. Cloth. Price, \$10. Pp. 792, with 174 illustrations. Philadelphia: Lea & Febiger, 1942.

The author of this volume is well known in hematology. The subjects of the eighteen chapters are origin and development of the cells of the blood in the embryo, infant and adult; the erythrocyte; the leukocytes; blood platelets; the blood as a whole; the principles and technic of blood examination; general considerations and treatment of anemia; pernicious anemia and related macrocytic anemias; normocytic anemias; hemolytic anemias; hypochromic microcytic (iron deficiency) anemia; anemia in infancy and childhood; polycythemia; the purpuras; hemophilia and other hemorrhagic disorders; leukemia; tumors and tumor-like conditions involving the blood forming organs; granulocytopenia and infectious mononucleosis. Each chapter is well written, is illustrated where indicated and contains a complete bibliography. It is difficult to choose one chapter which is far superior to the others, but most readers will probably give special attention to the sections on the purpuras, hemophilia, leukemia and granulocytopenia. These are current and popular topics because of our ever expanding knowledge of the effect of commonly used medicaments on the blood cells. Of particular value to laboratory workers will be an appendix which tabulates the blood counts in twenty-three species of mammals and presents a bibliography on comparative hematology. This book is a valuable addition to any library.

La educación y el cuidado de los excepcionales. Síntesis de la labor que se realiza en los Estados Unidos en beneficio de los niños y adultos que se apartan de lo normal. Por Nerle E. Frampton y Camilla Morgan. Publicaciones de la Unión Panamericana. Educación, números 113-114. Paper. Pp. 38. Washington, D. C., 1941.

This pamphlet constitutes a synthesis of the work which is carried on in the United States in benefit of children and adults who are "exceptional," especially the handicapped. It contains information on the purposes and activities of the most prominent national organizations of the United States which are entirely devoted to work for the welfare and especially for the education of the different groups of the handicapped. It gives the names, local addresses and descriptions of the work carried on by the various national organizations for the education of the blind, the deaf, the crippled, those with speech disorders, heart diseases, cancer and tuberculosis, as well as those who offer problems of social and mental hygiene, juvenile delinquency and the "exceptionals" in general, which includes subnormal and supernormal. At the end of each chapter, in which the work of a given association is described, there is also a section of selected bibliography of American authors for each of the different groups.

Prepayment Plans for Medical Care. By Franz Goldmann, M.D., Associate Clinical Professor of Public Health, Yale University School of Medicine. Part I: Underlying Principles. Part II: A Comparative Study of Services and Costs of Five Plans. Joint Committee of the Twentieth Century Fund and the Good Will Fund; and Medical Administration Service, Inc. Paper. Price, 25 cents. Pp. 60. Boston: Edward A. Filene Good Will Fund, [n. d.].

Five plans that are only partially identified are described. It is assumed that "group practice of medicine" insures a body of qualified specialists using all available methods of diagnosis and treatment, while it is implied that plans involving the free choice of a physician will deliver care by a general practitioner who will be isolated from specialists, laboratories and hospitals. Description of the various plans is somewhat sketchy, giving the principal factors in easily comparable form. Considerable attention is given to costs without the author's recognizing that actuarial facts concerning most of the plans are still indefinite.

The 1941 Year Book of Pathology and Immunology. Pathology. Edited by Howard T. Karsner, M.D., Professor of Pathology, Director of the Institute of Pathology, Western Reserve University, Cleveland. Immunology. Edited by Sanford B. Hooker, A.M., M.D., Professor of Immunology, Boston University School of Medicine, Boston. Cloth. Price, \$3. Pp. 623, with 136 illustrations. Chicago: Year Book Publishers, Inc., 1941.

The 1941 Year Book of Pathology and Immunology follows the plan of previous volumes in including the most important abstracts in the fields concerned with, however, a great number of editorial comments based on the editors' experience. Attention is called specifically to new work on shock, arteriosclerosis, blood transfusion and gramicidin.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

ABORTING A COLD

To the Editor:—What is the therapy for acute coryza? What is the surest way of aborting a cold at the earliest onset of symptoms?

M.D., Illinois.

ANSWER.—Since acute coryza is recognized as a nonspecific self-limited disease for which there is no specific remedy, it is the consensus that it should be treated in the most conservative manner. The prime considerations are relief from pain, complete physical and mental rest, plenty of fluids and a mild diet. The patient should be in bed in a room whose humidity is at least 45 to 60 degrees. A steam kettle or a vaporizer should be kept going for this purpose. It is immaterial whether the vapor is impregnated with compound tincture of benzoin, oil of eucalyptus or any other aromatic substance, since the medication of the vapor adds nothing to the effectiveness of the moisture. Opiates, particularly Dover's powder (powder of ipecac and opium) are useful in reducing tension and relieving pain; they are preferable to the depressing coal tar products. A mild laxative is indicated only if there is evidence of intestinal stasis. Purging is contraindicated. If the nasal passages are blocked, relief may be obtained by the use of a 1 per cent solution of ephedrine in isotonic solution of sodium chloride instilled in the Parkinson or the Proetz position. The patient should be kept warm and protected from drafts. The room may be aired at intervals, but the windows should be kept closed in the interim.

The treatment described is the most effective way of aborting incipient coryza because it tends to overcome the vasomotor shock which initiates the usual cold.

COMMON COLDS AND ULTRAVIOLET RAYS

To the Editor:—A patient has called my attention to the article entitled "Conquering the Common Cold and Other Air Borne Infections" which appeared in the *New Republic*, Dec. 15, 1941. I should like your opinion as to the value of the new ultraviolet ray lamp mentioned in this article, with particular emphasis on its use in combating the germ of the common cold.

Ben H. Hollis, M.D., Louisville, Ky.

ANSWER.—William Firth Wells and Mildred Weeks Wells (*Am. J. Pub. Health* 28:343 [March] 1938) began work with the installation of ultraviolet ray lamps set up under competent and rigid medical control in order to determine their value in controlling the sanitary quality of the air, with the hope of reducing respiratory disease.

Studies are being conducted at the Henry Phipps Institute in Philadelphia and at the Cradle Society, Evanston, Ill. (*THE JOURNAL*, April 11, 1942, p. 1271), which it is hoped will aid in determining the usefulness of ultraviolet rays in sterilizing the air.

Since the virus presumed to be responsible for colds has not been isolated or recognized, definite evidence of the effect of ultraviolet rays in combating colds is not available.

The evidence thus far presented seems to indicate that ultraviolet ray barriers set up between the cribs of infants in nurseries may help prevent the transmission of respiratory infections from one baby to another. Whether the installation of ultraviolet ray lamps in crowded rooms or in the sickroom will aid in preventing the transmission of colds has not been determined.

LIVER THERAPY OF MUCOUS COLITIS

To the Editor:—I have heard that there is a new method of treating mucous colitis by parenteral injection of liver. I would appreciate any information you can give me on the subject.

M.D., New Jersey.

ANSWER.—There is no evidence at present that mucous colitis can be treated by parenteral injections of liver. Parenteral injections of liver have been used in cases of idiopathic ulcerative colitis with variable results. The only beneficial effect one could ascribe in cases of mucous colitis to the parenteral injection of liver would be to the possibility of the patient's having an added amount of vitamin B complex, which is contained in any good extract, particularly the crude type.

CHRONIC ACTIVE GLOMERULONEPHRITIS

To the Editor:—A man aged 24 has chronic interstitial nephritis (with symptoms of hypertension, edema, albuminuria, casts in the urine and anemia) and may be "headed for" uremia. What is the latest treatment for this condition?

Louis L. Dolinsky, M.D., Woodside, N.Y.

ANSWER.—Judging from the age of the patient and the symptoms, it may be assumed that the diagnosis of chronic interstitial nephritis signifies chronic active glomerulonephritis rather than the arteriosclerotic renal disease, or nephrosclerosis, secondary to essential hypertension. The association of edema and hypertension in a young person with nephritis constitutes the "mixed" type in which the edema is attributable to proteinuria and hypoproteinemia. If the nephritis has lasted long enough to produce cardiac insufficiency, by way of hypertension, the edema could be cardiac rather than renal. Treatment, of course, would vary correspondingly.

The management of a patient with chronic glomerulonephritis resolves into general and symptomatic measures. The general treatment includes giving an adequate diet for the maintenance of normal nutrition, taking precautions against exposure to infections of the respiratory tract, institution of bed rest even during minor colds and careful periodic examinations including tests of renal function and study of the sediment of concentrated urine. Foci of infection should be treated on the basis of their local importance rather than of their possible relation to the chronic renal process; otherwise the results will be disappointing if not actually harmful. The decision to eradicate a focus of infection is more logical when it can be ascertained that a flare-up of the nephritis definitely followed an acute localized infection.

The symptomatic treatment refers to the control of edema, anemia, hypertension and its sequelae. The foundation of the treatment of renal edema is a low salt intake. If this can be achieved, restriction of fluids becomes unnecessary. Bed rest is essential whenever there is more than slight edema. The diet should be normal except for the salt content and should contain 75 to 100 Gm. of protein, at least half of animal origin, including meat. Reduction of dietary protein is indicated only when the patient has severe renal insufficiency and is unable to eat. A blood urea or nonprotein nitrogen two or even three times normal is not incompatible with a good appetite and is not an indication for restriction of protein, especially when considerable proteinuria continues to act as a drain on body protein. If dietary protein is curtailed, adequate calories must be supplied as carbohydrate and fat in order to prevent loss of body tissue.

Of the many diuretics available, the acid-forming salts and the organic mercurials give the best results in the treatment of chronic renal edema. Potassium salts in full doses may induce excellent diuresis in patients who can tolerate them. The ordinary purine drugs are generally disappointing in renal edema. Acaia, as given intravenously, is not to be recommended for use in general practice. Before any powerful diuretic drug is employed it is essential to determine the level of renal function, because diuresis depends on the renal excretion of the drug and toxic effects are likely to follow retention of the drug. Mercury should not be given if the urea clearance is less than one third of normal or the maximum urinary specific gravity on an eighteen hour concentration test is less than 1.018, corrected for protein in the urine. If there is any question of cardiac insufficiency, digitalization should be carried out just as it would be in nonrenal edema, since low renal function is not a contraindication to the use of digitalis. The degree of diuresis will depend on the amount of edema, the level of renal function, the plasma albumin concentration and the efficiency of salt restriction. Minor residual edema of the legs may be controlled with elastic bandages.

Anemia in nephritis may be nutritional in origin or part of the toxic effect of renal insufficiency. In the former case, a good diet and a supplement of iron will usually improve the blood; in the latter, one may have to resort to repeated small blood transfusions whenever the hemoglobin level falls below 50 to 60 per cent. The slightest incompatibility of bloods may produce dangerous renal effects in preuremic patients.

Hypertension in chronic glomerulonephritis does not require treatment nor is it particularly responsive to the measures ordinarily employed in essential hypertension. However, the complications of hypertension in the form of encephalopathy and cardiac insufficiency can be treated in nephritic patients as in others. Low renal function renders the use of hypertonic solutions of sucrose, intravenously, questionable because of delayed excretion and noneffectiveness. Sedatives like bromides and barbitals which depend on urinary excretion should be given with caution, if at all.

POLYNEURITIS IN A WATCHMAKER

To the Editor:—A man aged 28, who had been working in a watch factory for the past several years, suddenly became ill, complaining of severe pain in one arm and then the other, and later of pain in the abdomen and legs. His temperature varied between 100 and 104 F. Later he had a bilateral wrist drop and wasting of the upper extremity. He was admitted to the hospital, where he remained for eight weeks before he died. Several diagnoses were made, such as polyneuritis, poliomyelitis and meningitis. A postmortem was performed and a diagnosis of infectious polyneuritis was made. While working in the watch factory the man came in contact with a solution of dilute cyanide, cream of tartar, alcohol and acetic acid, nickel chloride and nickel sulfate, copper cyanide, gold cyanide, silver chloride and silver cyanide. Is it not possible that the patient acquired polyneuritis as a result of his occupation, which through lowered resistance on account of his long illness became an infectious type and hastened his death? Are there such cases on record? Kindly send me reference material or advise where I can obtain this material.

William A. Lustusky, M.D., Mount Carmel, Pa.

ANSWER.—The preeminent but still minor occupational diseases of the watchmaker center about a variety of dyskinesias or cramps or trade neuroses akin to the better known "writers' cramp." These result from repetitive movements in manipulating small parts, usually metal, in watch parts production and assembly. To some extent the damage may be functional, but the possibility that a neuritis exists is recognized. While work disability may arise, such disability is limited to special operations and by no means is general. So localized are such injuries that it is only fabulous to conceive that such affairs might attain the severity described in this query. Of greater significance is the implication found in the query that this former workman was not a watchmaker but a plater and thus not subject to the dyskinesias mentioned. The question then becomes: Will the plating materials mentioned lead to a fatal polycneuritis? The answer must be made in the negative, and no such occurrences are found in authentic literature. Gold, silver, nickel and copper are not recognized as likely sources of systemic diseases after industrial exposures. Cyanides are highly toxic but do not induce the manifestations of the acute episode described. Cyanide gases constitute internal asphyxiants but are without selective action for peripheral nerve tissues. The well elevated temperature at onset militates in some measure against any chemical action. The concept that the wear and tear, of work lowered resistance might apply equally to large numbers of occupations and is scarcely tenable.

PITYRIASIS RUBRA PILARIS

To the Editor:—In a girl aged 13 there developed five months ago hard dry papules on the dorsal and ventral surfaces of the feet and hands. Within a few weeks the eruption became universal, with some sparing of the flexor surfaces of her arms. In most areas the papules have become confluent; the entire back and face are one dry red plaque partially covered with branny scales. The scalp presents a picture of moderately severe seborrheic dermatitis, "dandruff," with much scaling and some loss of hair. The nails are striated and the palms and soles are thickened. The patient is somewhat underweight, has not reached puberty but otherwise is in fair health, except that a few days ago mild bronchopneumonia developed. A dermatologist prescribed large doses of vitamin A and various external methods of treatment, including tar baths, frequent oil rubs and sulfur ointment. There has been a moderate amount of itching present since inception of the condition. This is apparently a case of pityriasis rubra pilaris. Please answer the following questions: Could this be a manifestation of a dermatosis due to a vitamin A deficiency, assuming that the girl comes from a well-to-do family and has had sufficient amounts of vegetables and dairy products in her daily diet? What is the cause of pityriasis rubra pilaris? Could there be a hormonal dysfunction, that is of the thyroid? What would you advise as to internal and external therapy?

Eugene J. Boros, M.D., Bethany, Ill.

ANSWER.—This is undoubtedly a case of pityriasis rubra pilaris. In recent years a disease of the skin has been reported in which follicular hyperkeratosis, the same pathologic appearance seen in pityriasis rubra pilaris, is present to a less degree. Numerous writers have described a condition in undernourished patients in the tropics and in the Orient in which a rough skin with follicular hyperkeratosis (phrynodermia, meaning toadskin) was associated with well established signs of vitamin A deficiency, such as xerophthalmia, keratomalacia and night blindness. More recently a similar disorder has been described as affecting white persons, children and adults, and under appropriate therapy the skin has been restored to normal. This condition usually affected persons of the underprivileged class or those who for some reason had undergone a rigid restriction of the diet. It seems well established on the basis of these reports and experiments that under certain conditions a deficiency of vitamin A provokes a characteristic response in the skin.

Microscopic studies made in cases of phrynodermia show a striking similarity in many respects to the microscopic picture

of pityriasis rubra pilaris. In 3 cases of pityriasis rubra pilaris reported by Brunsting and Sheard (*Dark Adaptation in Pityriasis Rubra Pilaris*, *Arch. Dermat. & Syph.* 43:42 [Jan.] 1941) the abnormally high levels of dark adaptation present were corrected promptly by the administration of large amounts of vitamin A. The response of the skin, however, was considerably delayed. Failure in response or a delayed response of the skin to a therapeutic test by means of the administration of large amounts of carotene or of vitamin A is only of relative value in determining the ultimate importance of a disturbance of vitamin metabolism in this peculiar disease entity.

In an article by Peck, Chargin and Sabotka (*Keratosis Follicularis, a Vitamin A Deficiency Disease*, *ibid.* 43:223 [Feb.] 1941) the authors state that patients with keratosis follicularis when given a normal diet, which apparently contains an adequate amount of vitamin A, are unable to maintain a normal vitamin A level in the blood because of either inability to absorb the required quantity of vitamin A from the gastrointestinal tract or inability to convert the provitamin A, carotene, into vitamin A. This will explain the reason for giving vitamin A in pityriasis rubra pilaris. The reference may explain why a girl on a normal diet should show a vitamin A deficiency.

The cause of the disease is unknown. It is a chronic benign process in the skin, runs a varied course and may show a familial trend. There is no evidence to show that there is a hormonal dysfunction of the thyroid. The treatment outlined by the dermatologist is excellent and should be continued.

BLEEDING FROM MUCOUS MEMBRANES CAUSED BY HEPARIN

To the Editor:—Hove cases been reported in which heparin has caused bleeding from the mucous membranes, namely the gums and the bowel? The following case was observed in our hospital: A woman aged 74 with hypertension and an apparently sound heart was operated on for partial intestinal obstruction and an enlarged, thickened gallbladder with a solitary stone. The stone was removed, and drainage of the gallbladder was instituted; distention, nausea, vomiting and constipation followed. About the fifth day, after the use of enemas and the Wengenstein suction apparatus, she was doing well, when thrombosis of the popliteal artery occurred. It was decided not to intervene. After the second day one ampule of heparin was administered in 500 cc. of dextrose solution. The clotting time was eight minutes after administration. The next day, a second ampule was given and the clotting time was five and one-half minutes. Twenty-four hours later two ampules were administered in 500 cc. of dextrose solution and the clotting time was over ten minutes. This was followed by bleeding from the gums and the bowel which lasted over twelve hours. The heparin seemingly had no effect on the condition of the leg, which gradually became more cyanotic, and the circulation became more impaired. The patient lived four or five days more before death, the heparin apparently having no effect for better or worse. I have read a report by an author who has given heparin until the clotting time was prolonged for nearly an hour with no bleeding.

M.D., New Jersey.

ANSWER.—Only a tentative answer can be given to this inquiry, because the dose of heparin is unknown and it is not known how soon after the administration of heparin the coagulation time was determined. Also the method used has not been stated. Ampules of different sizes and concentrations are on the market, but it may be assumed that a 10 cc. ampule, containing 100 mg. of heparin, was used. This dose is usually insufficient to maintain a coagulation time of ten to fifteen minutes during the entire day and night. However, when given suddenly, within a few minutes to one-half hour, it may raise the coagulation time to a dangerous level.

The reaction of patients to heparin differs a great deal. Some patients are much more sensitive to it than others. If the patient has a damaged liver, jaundice or a hemorrhagic tendency, because of a vitamin deficiency, bleeding will occur sooner. A single determination of the coagulation time may not give a true idea of the action of heparin, as it may be made before or after the peak of the coagulation curve has been reached. The only way to administer heparin safely is to determine the coagulation time at short intervals, probably every half hour, until the tolerance of the patient is known. There have been a number of reported and unreported cases of hemorrhage following the use of heparin both in the postoperative field and in unsuspected defects in the mucous membrane, such as a duodenal ulcer or the lesion of ulcerative colitis. The drug must be administered with a great deal of caution and with exact indications. Thrombosis of the popliteal artery seems to constitute a proper indication, except that one should not expect a restoration of circulation from its use, as heparin will not dissolve existing clots but will prevent further clotting proximal or distal to the existing thrombus.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE
DEPARTMENT, JANUARY-APRIL 1942

Titles have been listed or Abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals, except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1932. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "SS," Student Section; "ab," abstracts; the star (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." State board examinations are entered under the general heading State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1576.
